THE BUILDERS' JOURNAL

AND ARCHITECTURAL ENGINEER

APPEALING TO THOSE ENGAGED IN

THE ART OF BUILDING.

IT is our aim, our ambition, our aspiration even, to build our Journal worthily and well, not for the hour only, but for future years; for the few men in the forefront of an enduring and a laborious art; for the disciplined ranks of a distinguished profession; for the young men—Architects to be—and for all who love a clustered column or a flying buttress, a traceried window or a Greek frieze; for the man, too, who honestly plumbs a jamb . . . .

6, GREAT NEW STREET,
LONDON.

Standard Specification for Steel. The Engineering Standards Committee have just published a British Standard Specification for structural steel for bridges and general building construction. The standard lists of rolled sections for structural purposes was published some time ago. This present specification deals with the process of manufacture to be employed, the standard sizes and shapes of test pieces, and the tests to which they shall be subjected. The specification will no doubt meet with the approval of architects. The sectional committee on bridges and general building construction which has drawn up this specification submitted the draft to the Science Standing Committee of the Royal Institute of British Architects, and as a result of this co-operation certain modifications were made. The specification was adopted by the sectional committee on May 23rd, and the report was approved by the main committee on June 19th. The chief points in the specification are briefly as follows:—Plates and rivet bars and sectional material for bridges can be made by the open hearth, acid or basic processes, but must not show on analysis more than ·06 per cent. of sulphur or phosphorus. Sectional material for building construction may, however, be made by the Bessemer process in addition to the others above referred to, but while it may not show a greater percentage of sulphur than stated above, the percentage of phosphorus may be increased to ·07. Plate sections and bars should be free from defects, and they must not vary from the calculated weight more than $2\frac{1}{2}$ per cent. above or below. The standard test-pieces should be cut lengthwise or crosswise in the case of plates and lengthwise in the case of sectional material and bars. They should be similarly and simultaneously treated with the material before being tested. None of the material is to be despatched from the works until the tests have been made by the representative of the architect, engineer or purchaser, and the mill sheets signed by him. Illustrations and particulars are given of the standard test-pieces. For plates and sectional material the steel is required to show a tensile breaking strength of 28 to 32 tons per sq. in., with an elongation of not less than 20 per cent. Bend tests only are required for material under $\frac{5}{16}$in. thick. Rivet bars are required to show a tensile strength of 26 to 30 tons per sq. in., with an elongation of not less than 25 per cent. They may be tested the full size as rolled. One tensile test is to be made from every cast, or every 25 tons, whichever is least. For both the cold bend and the temper bend tests the material must withstand, without fracture, being doubled over until the internal radius is not greater than $1\frac{1}{2}$ times the thickness of the test-piece and the sides are parallel. Bend tests may be made by pressure or by blows. Such tests are not required for rivet bars; rivets are tested by bending the shanks cold and hammering until the two parts of the shank touch each other without fracture on the outside, while the heads of the rivets are required to stand being flattened when hot until their diameter is $2\frac{1}{2}$ times the diameter of the shanks, without cracking at the edges. All plates and sectional material is required to be branded with the maker's name or trade-mark, the place where made, and with number or identification marks by which they can be traced to the cast from which made. With small pieces a metal tag attached to the bundle is sufficient. The representative is to have free access to the works at all reasonable times and to inspect the manufacture at any stage. The material for testing is to be supplied free of charge and the maker is required to supply the testing appliances and labour, or if facilities do not exist at the works, to bear the cost of carrying out the tests elsewhere. Where no inspection takes place at the works the maker must supply to the purchaser a signed test sheet giving the results of the mechanical tests, and, when required, the analysis of each particular cast.

A Record of the Congress. In our issue for last week we referred to the exhibitions which are to be held in connection with the International Congress of Architects, which opens on Monday, July 16th, and continues throughout that week. These exhibitions, we may again remind our readers, will consist, firstly, of photographs and models of notable buildings in this country and, secondly, of photographs of modern work by living British architects. We referred to the highly interesting nature of these exhibitions as forming a history of English architecture superior to any that has ever been attempted before. It is satisfactory to know that there will be some permanent record of these exhibitions. We still hope, however, that this collection will not be seen for the first and last time at the Congress, but that it will become a permanency. Nevertheless, even if the collection is not available for future students of architecture, the record will not be lost; for our contemporary, THE ARCHITECTURAL REVIEW, has arranged to publish many of the photographs that will be exhibited, together with a short historical résumé written by Mr. E. S. Prior, Mr. J. A. Gotch and Mr. Mervyn Macartney, who, it will be remembered, are partly responsible for the collection and arrangement of the historical exhibition. The number will also contain reproductions of the models of St. Paul's Cathedral (Wren's first design), and other interesting models which have been lent to the Congress Committee, as referred to in our note of last week. In the same issue of THE ARCHITECTURAL REVIEW there will be a catalogue raisonné of the exhibits. This should be of great value, as it will give information that can only be obtained at present by laborious research in a number of books. This catalogue will contain lists of the various authenticated works of the various masters of architecture, and also of the works which have been ascribed to them, but which were probably designed by their pupils or their imitators. In addition there will be a number of reproductions of photographs of fine examples of architecture that have never before been published; these have been specially taken for this number. It is obvious therefore that the "Congress Issue" of THE ARCHITECTURAL REVIEW will form the most compact illustrated history of British architecture that has yet been published, besides constituting a most valuable souvenir of the first International Congress of Architects held in England. We feel its importance warrants reference in these columns. The number will be published on July 17th, and the price will be 5s.

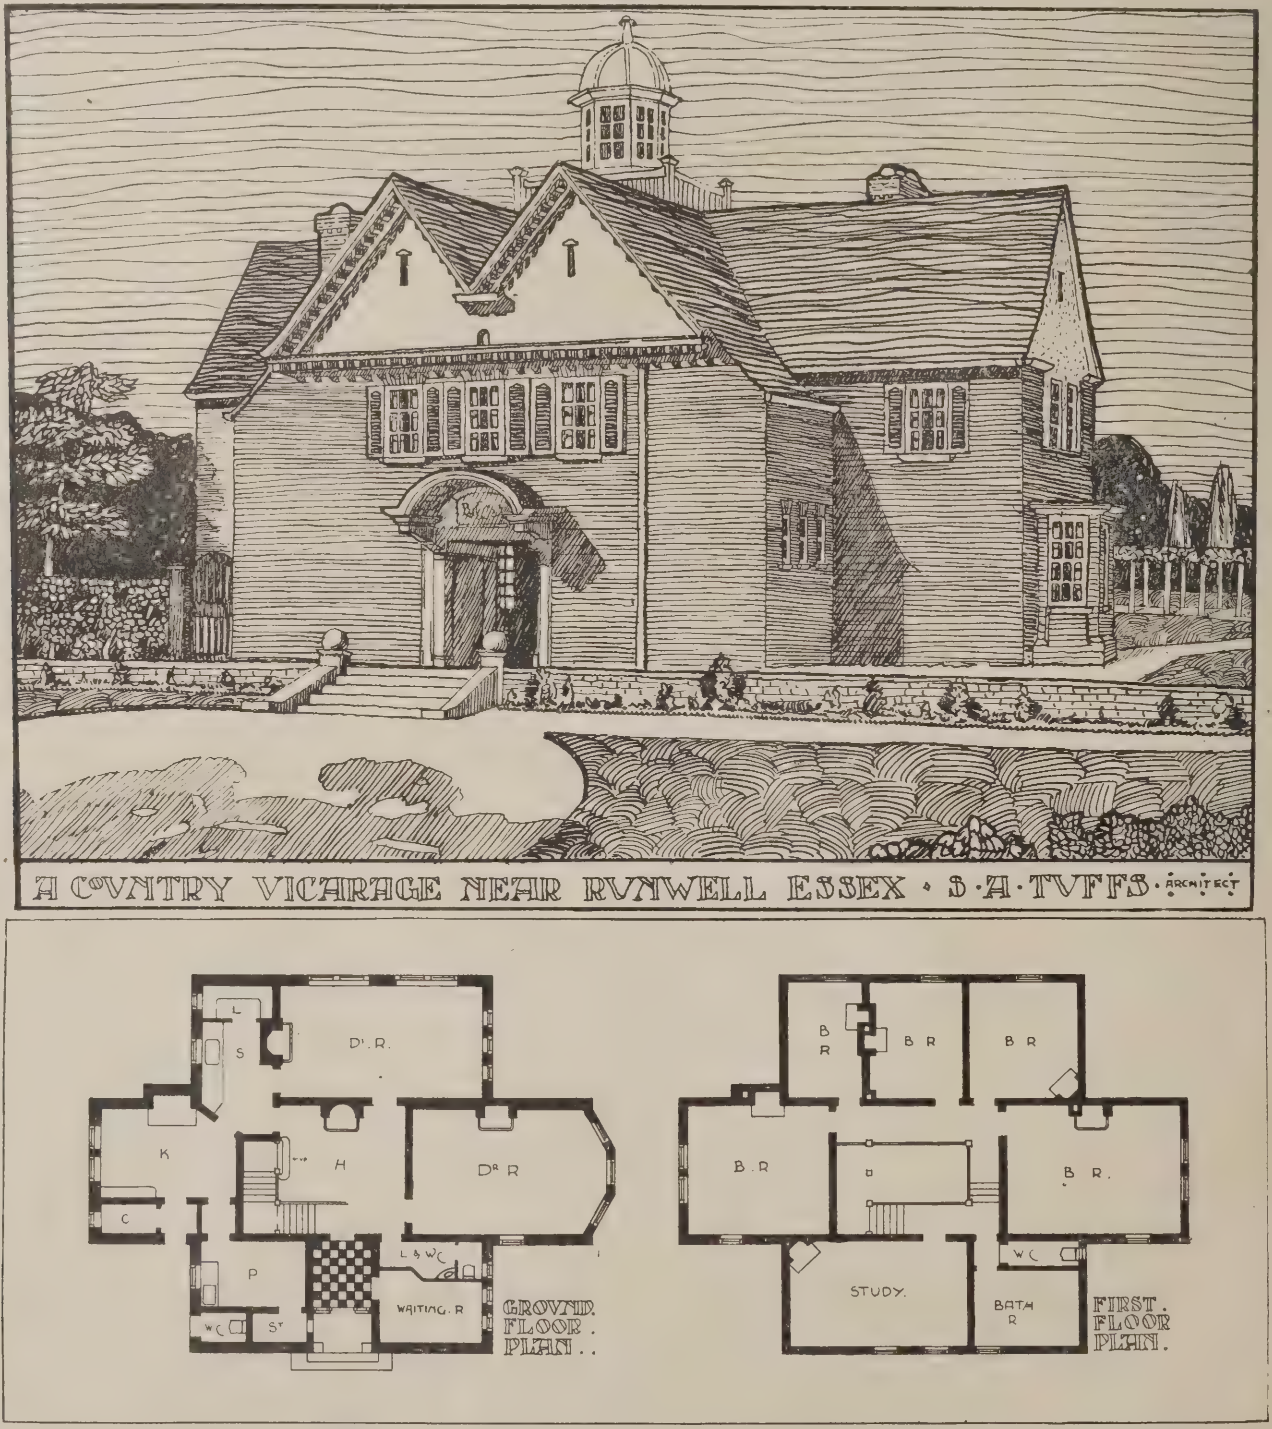
THE TWO METHODS OF DESIGN.

THE June issue of the "Architectural Record" of New York contains a very interesting article by Mr. Russell Sturgis on "School and Practice Designing." First there is, he says, the method common throughout the United States, namely, the following very closely of certain types which are embodied in Italian buildings of the sixteenth and seventeenth centuries, and are laid down in Italian, French and English books of different periods: this method having for its primal and originating force a close study of Roman colonnades, Roman proportions, Roman ornamentation.

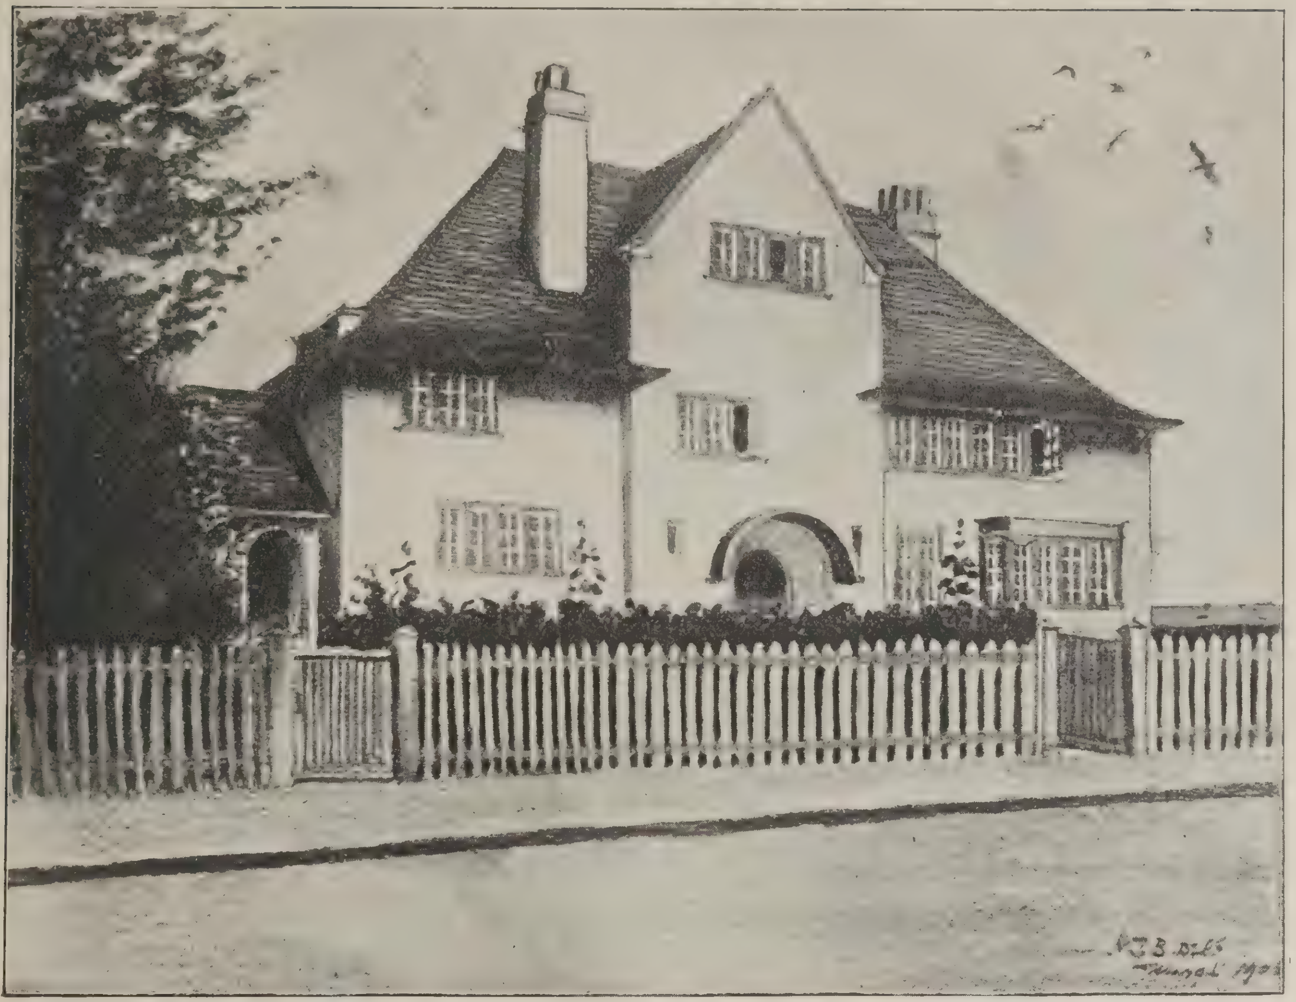
"Many of us heard a member of one of our great architectural societies state in a speech, and dealing with a building of his own, that 'he knew the details were good Renaissance because they were taken right of the theatre of Marcellus'—which is an ancient Roman building of the prime. The English, and American writers following them, spoke of any modern building as 'Renaissance,' using the word as an adjective. The English Renaissance was supposed to include St. Paul's and Somerset House, while the Renaissance in France covered the *Ecole Militaire*, built in 1751, and even the Panthéon, twenty years later, at the very door of the Revolution."

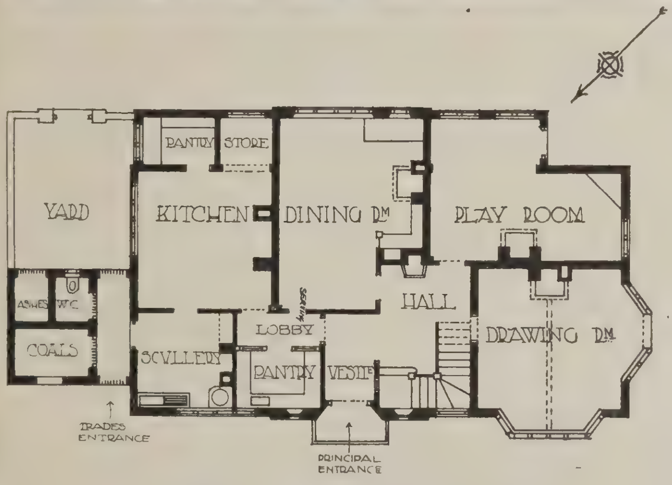
At all events, says Mr. Sturgis, the above is an attempted description of a certain method of designing, a method based upon authority, although the "authority" is of doubtful origin in many cases.

A Man who builds Roman Colonnades may very well be uncertain whether he is following the temple of Mars Ultor, restated for him by photographs from the ruin, or whether he is following the plates in some folio on his office shelves, and purporting to represent that great work of Augustus. The man who is designing, in a sense, Greek anthemions and Ionic capitals may well be uncertain whether they are the plates of Stuart & Revett which he is following or a memory helped by a photograph of some part of the Erechtheum. "The English are inclined to follow Palladio, who died in 1580. The French are more inclined to study the works of Vignola, who died in 1573. To a certain extent the architects of our time are influenced by much more trustworthy representations of Greco-Roman buildings. To a very great extent they are swayed by their own memories of the years spent in the school of art in which they were taught, and by the *projets*—the school-competition

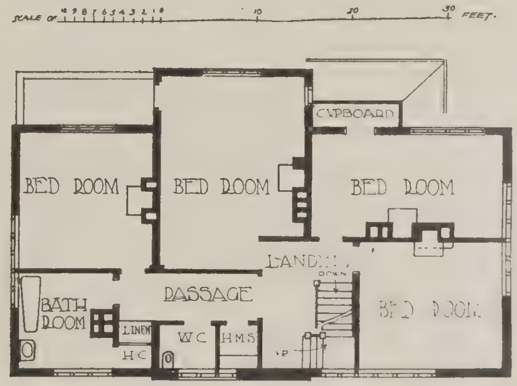


This vicarage is designed to be executed in local red bricks, rough-cast in gables, and roofed with green slates. Timber porch constructed of teak, with top of hood covered with lead. Shutters painted green, other woodwork white. The accommodation provided includes a central hall (lighted from above), with dining- and drawing-rooms, waiting-room and lavatory, and the usual offices on ground floor; while on the first floor there are study, lavatory and bathroom, and five bedrooms. The architect is Mr. S. A. Tuffs, of 42, Horace Road, Forest Gate, E.





The GROUND PLAN.



The CHAMBER PLAN

HOUSE AT BRIDLINGTON, YORKS. HERBERT T. BUCKLAND AND E. HAYWOOD-FARMER, ARCHITECTS.

This house is modelled upon one erected by the same architects at Edgbaston some years ago. The instructions were to build a house as nearly as possible like it in external appearance and plan. The difference in aspect and view, and other circumstances, necessitated the complete turning round of the plan, and certain rearrangement of other portions. The walls are built of brick, rough-casted externally with Portland cement, the roofs being laid with Hartshill sand-faced tiles. Internally the plaster is finished with a wood float, and distempered. The joinery throughout is of red deal painted, with the exception of the dining-room, which has panelling in English oak round the ingle-nook. The total cost will be from £1,150 to £1,200.

lesigns which they made in those sunny days f youth. The Frenchmen who came to hicago in 1893 exclaimed with one voice, vhen they saw the plaster façades surrounding the Court of Honour, that those were the ame old *projets d'Ecole* – and so they were."

That, then, is one method of designing.

The other Method

onsists in summoning up from the resources f the memory such architectural forms as eem best fitted to the larger task about to be imposed upon the designer. The constructor has only the safety of his work to consider: the architectural artist has to think in terms of architecture as well, and to use them in a new composition. This is the free method of designing. "If the designer has a great public library to build, it will not enter very seriously into his scheme that a great and very costly colonnade should form the whole principal front of it, using up a space of 6,000 sq. ft. of the precious city plot, and giving nothing in return except an out-of-door shelter which ten people a month may use in the hot weather, or might use if police regulations would allow. It is not so that he will go at his task. He will think, rather, of how he may provide a spacious interior. It is true also that he will be thinking all the while of what his exterior will be like; but he will recognize that exterior as a dependent part of the work—a result of the interior. And the result he obtains will be then less grandiose but more intelligible; far less costly in proportion to the result, much more expressive of the purpose of the building; and incomparably more original."

To call the first of these methods the traditional one is to deny the use of that term to the second method; and yet the second method, the free method, may be traditional also.

The School Idea.

Let us try the effect of the terms "school method" and "practice method" as descriptions of the two methods of design. The one is that which (for our sins) is mainly taught to the young architects of the period in their schools. They are taught in this way because no other way is so convenient. You are a professor in a school of architecture; you have to submit a problem to a class. It will be very much easier for you to say, "Let us design a pavilion by the waterside, not to exceed so many feet in dimension"—much easier to say this than to give the requirements of a private man about to build a small country house, or of a church committee about to undertake a small village church. But the pavilion by the waterside runs inevitably to grandiose reminiscences of the splendid European monuments shown in the books, which are, of course, at the disposal of the designer, or which have been at his disposal. The different designs for it can be compared with relative ease. The accuracy, according to the accepted authority, of the Ionic or the Roman Doric colonnade, its accuracy in general proportions and in the larger and the smaller details, according to the standard of this, that or the other recognized authority, is easy to decide.

It is therefore not amiss to call the first the school method, or school designing. In like manner it may seem rather obvious why the term "practice designing" is used for that other method.

There is no reason why school designing should be almost entirely identified with the different neo-classic styles. It is merely the fashion of the day to try to design as the Italians of the seventeenth century designed, or perhaps as the strong men of France at a later time faced their problems. "In England, fifty years ago, and at a later time than that, the fashion was altogether different, and so far as there were schools of architecture, there and then, they taught Gothic church architecture, almost to the exclusion of other styles. This is reflected in the English books of the day, of which there are many, devoted to the mediæval styles almost exclusively, and to the English styles in the main. In France the classical feeling has always been very largely traditional in the best sense, for the strong artistic leaning in French society has sufficed to make the changes of the Revolution less fatal to the continuous growth of art in the very country of the Revolution than they have proved to be in other European lands. But the teaching of neo-classic art in France is a very different thing from that of the United States. Even the teaching of the art is not wholly in the direction of school designing. There are some of the *ateliers*, or working studios connected with the Ecole des Beaux Arts, in which a rather serious attempt is made to build up a wholly modern system of design; with a classical origin and under classical influence indeed, but without a close adherence to classical forms."

On the other hand, if we were to substitute for our term "practice designing" some such term as designing in the mediæval spirit, we should belie and contradict the facts of history; for there can be no doubt that the people of Greco-Roman antiquity designed as freely as the people of the twelfth century after. The difficulty is that we do not know how those Greco-Roman designers did their work, except in the huge public monuments where cost was disregarded, where splendour was the one thing required. We have no idea at all of the way in which a Roman of the first century would have looked at the problem of a street front; nor do we know how he would have treated a country house with many rooms, if smaller than those conceived by the great millionaires of the metropolis, when building their villas at Tibur, or at Tusculum, or on the Bay of Naples. It does not help us much for our daily duty as architects to know the way in which an Imperial villa was distributed. And, as for the street front, when Viollet-le-Duc was considering, about 1870, the subject of Human Habitation in all Ages, he was compelled to base his own design for a Roman five-storey house, and for a six-storey house across the way, so closely upon what he had seen in different parts of modern Italy that the selection and combination of the details is a little laughable, although one accepts to the full the sincerity and the intelligent reasoning of that most dexterous of the restorers of the past.

NOTES ON COMPETITIONS.

Holborn Borough Offices.

At last week's meeting of the Holborn Borough Council the Establishment Committee reported that they had considered the six designs for new offices which had been sent in by the six architects invited to compete, and they were of opinion that the best to suit the requirements of the council was the design numbered 1. The estimated cost of the building was £19,205. It was decided to exhibit the whole of the designs in the council-chamber, and to consider the report of the committee at the next meeting of the council, to be held to-day. Designs Nos. 5 and 6 were placed second and third respectively. The names of the authors are not yet disclosed.

Carnegie Library, Northampton.

The local architects at Northampton have addressed a petition to the mayor and members of the town council in reference to the proposed Carnegie library to be built in their town at a cost of £15,000. They ask that all architects practising in Northampton be invited to submit competitive designs, and that the competition be limited to themselves. The borough engineer, Mr. Alfred Fidler, has prepared a design for the building, and it is against this the petition of the local architects is particularly directed. A correspondent sends us an illustration of the front elevation. It is not blatant, but merely dull and stodgy. The architects of Northampton claim to do better, but the special point with them seems to be one of principle—that borough engineers should not be entrusted with work of this class. With that claim we are in entire agreement. Borough engineers may be very good engineers (but with few exceptions) they are very bad architects. Of course some "architects" are just as bad, but they are very much more fitted as a class to undertake architectural design. At the meeting of the Northampton Town Council held on Monday this matter of the Carnegie library came up for discussion. At the time of going to press we have not heard the decision of the councillors, but as the design for the library was put in the hands of the borough engineer with the special object of saving money, we shall not be at all surprised to hear that his effort is to be approved, and that the local architects can retire to spend their wrath among themselves.

Library at Swadlincote.

The award of the assessor, Mr. Thomas Cooper, F.R.I.B.A., of Birmingham, for this building is:—First premium (£25), Mr. A. Macpherson, Derby; second (£15), Messrs. Walton & Thomas, Tamworth; third (£10), F. B. Cooper, Leicester.

Competitions Open.

The following is a list of competitions open:—

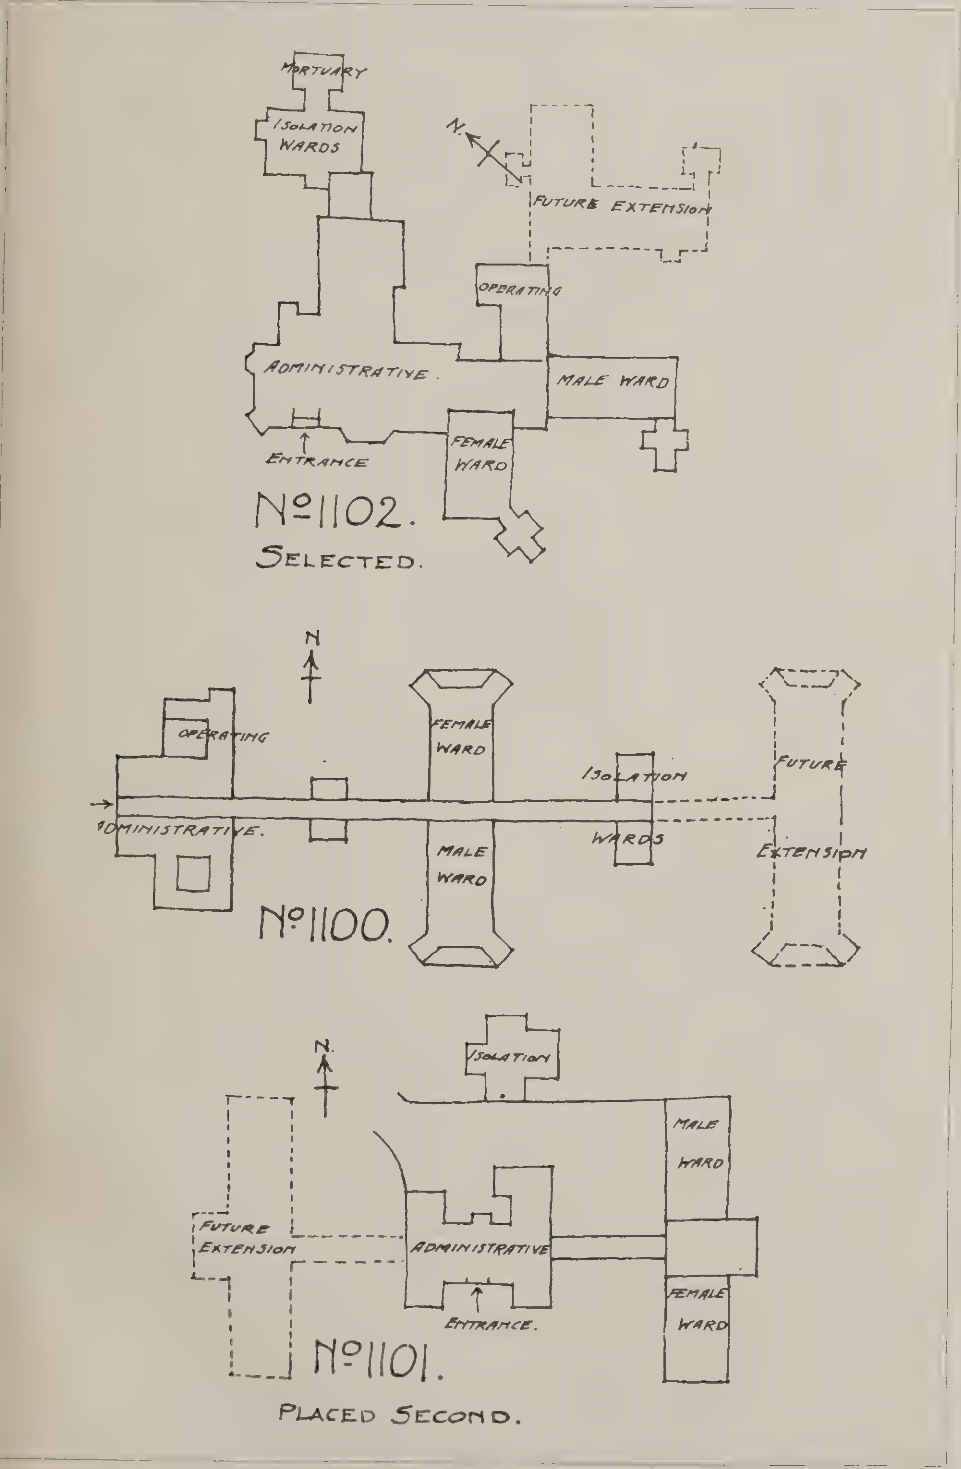
DATE OF DELIVERY.	COMPETITION.
July 4	SCHEME OF SEWERAGE AND SEWAGE-DISPOSAL WORKS AT WARBLINGTON. Premiums of £100 and £50. Particulars from Mr. J. W. Loader Cooper, clerk to the U.D.C., Queen Street, Emsworth.
Oct. 1	ALPHABET COMPETITION. Prizes of £20, £10 and £5. For particulars see "Architectural Review."
„ 31	BOURSE AT CAIRO.—Premiums of £E250 and £E100. International competition. Designs to be submitted to the "Corporation des Agents de Change," Cairo, Egypt.
—	NEW MUNICIPAL BUILDINGS AT STIRLING (to cost £12,000). Premiums of £100. Particulars from Town Clerk, Borough Buildings, King Street, Stirling.

St. Pancras Library.

Mr. Belcher will shortly be making his award in this competition.

Finchley Cottage Hospital.

If the object of a competition be to obtain the best scheme, by careful selection from a number of designs illustrative of the ingenuity and skill of an equal number of architects, the Finchley Hospital Committee may be said to have failed in attaining it. If, on the other hand, a competition be intended to serve one or other of those numerous and mysterious purposes the objects of which are incomprehensible to any but the initiated, then Finchley may be congratulated on the complete success of its venture. This is the conclusion which must have forced itself upon the minds of impartial observers of the five sets of drawings which have recently been on view in the council's schools. The sub-committee appointed to report on the designs consisted of Mr. E. A. Woodrow, F.R.I.B.A., Chairman of the General Committee, Dr. Lazarus Barlow (of Middlesex Hospital), Chairman of the Medical Committee, and Mr. W. H. Cross (late of St. Bartholomew's Hospital), Chairman of the Building Committee. The competitors were nominees of the sub-committee and were selected, so it was understood, on account of their experience in hospital planning. The inclusion in the committee of an architect of some standing inspired confidence that the interests of the competitors would not lack a champion. It is but fair to assume that the medical view has outbalanced the architectural one, and once again is proved the futility of a form of assessing which contains, as one of its elements, the lay opinion. The following are the names of the competitors and the numbers with which their designs were distinguished:—1100, Messrs. Russell & Cooper; 1101, Messrs. Young & Hall; 1102, Mr. E. B. I'Anson; 1103, Mr. A. O. Collard; 1104, Messrs. Yetts, Sturdy & Usher. Design No. 1102 is the selected one, and No. 1101 is placed second. The site is a rectangular one measuring about 368ft. from west to east, and 240ft. from north to south. A road exists on the western boundary, and it is proposed to make another on the eastern boundary. The conditions required a cottage hospital of twenty beds, ten for males, eight for females, and two for isolation cases; sleeping accommodation for the staff; an operating room with north and west lights and top light; ante-room, committee room, matron's sitting-room, nurses' dining and sitting room, box-room, surgery and dispensary, and mortuary. The cost was given at £4,500, to include building, fittings, fencing and gates. The selected design is a bewildering arrangement of wards and rooms suggesting, in the block, a country house with numerous wings which have been added from time to time according to the whims of its owners. The building is badly placed as regards aspect, and the accesses to the isolation wards and future extension are most unsatisfactory. The elevations are as bewildering as the plan. The design placed second shows decided evidence of a knowledge of hospital planning, and the award of twenty guineas obtained by its authors, in compliance with the conditions, as being the second best design, is fully justified. By far the best scheme, however, is No. 1,100, and why it has been relegated to oblivion is one of those mysteries to which reference has been made. The entrance is approached direct from the existing road. The wards, administrative departments, &c., are symmetrically placed on either side of a central covered way. The general scheme is designed to render the present portion complete in itself and to permit of the extension being executed without disturbance. The administrative block faces the existing road, and the ward blocks have their long axes north and south so that they may receive the maximum of sunlight on all sides. The ward offices and ablution room are placed in two blocks at the end of each ward, where they do not interfere with light or air; they are cut off from the wards and cross-ventilated. These are arranged in such a manner that a spacious verandah occupies the intervening space at the end of the wards, through which patients can obtain access to the grounds. The administrative offices and the operating room are all conveniently placed, and the bedrooms upon the first floor of the administrative block are comfortably arranged. The buildings are designed in a simple domestic type with Georgian feeling emphasising the institutional nature of the building, but retaining at the same time the character of a cottage hospital. The three plans commented upon are here illustrated in outline blocks with sufficient information marked on them to render comparison easy. A letter of protest against the award has been written by a competitor to the hon. secretary of the Hospital Committee, to which the following reply has been received: "In reply to yours of to-day's date, I beg to remind you that you accepted the conditions of the competition."



FINCHLEY COTTAGE HOSPITAL COMPETITION.

Correspondence.

Norwich Shirehouse Competition.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I note in your last issue that the tenders for the above work correspond very closely to the "architect's estimate," but this latter is a very different figure from that submitted by the same architect when his plans were sent in! How do the Norwich ratepayers feel about such an absolute fulfilment of the prophecy in your issue for January 17th? —Yours truly,

"JUSTICE."

Stone Preservation.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—On p. 314 of your issue for June 13th there is a paragraph under the heading of "Stone Preservation" which has reference to Mr. Alexander Muir's report upon the treatment of the Glasgow municipal buildings with "Szerelmey stone liquid." The wording of the second part of the paragraph, "although some stones are showing decay since they were treated, yet Mr. Muir considers they should have been cut out and replaced by new masonry," may, we think, convey an erroneous impression of the actual facts. It should be made clear that these stones were of inferior quality, and should not have been placed in the building. Mr. Alexander Muir's opinion as to the treatment is expressed in the concluding remark in his report, namely, "Looking over the whole building I see nothing even to suggest that the treatment is likely to prove anything but a thorough success."—Yours truly,

N. C. SZERELMEY & Co.

LONDON.

Professional Assessors.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—It is really refreshing to find a man who has had so much to do with competitions as Mr. Bonner letting himself go in print as he does in your issue for June 20th, and it is an interesting coincidence that Mr. Gammell should be tilting at the same windmill at the same moment within the sacred walls of No. 9, Conduit Street itself.

That the conduct of competitions will be a subject for acrimonious discussion so long as there are successful and disappointed architects is, I think, certain, but it is a hopeful sign when attacks on the system and its development on the lines laid down by the Institute come from the inside of that body.

I am entirely in sympathy with both Mr. Gammell and Mr. Bonner, but I think it is probably a mistake to assume that there are more Martin Chuzzlewits than Pecksniffs in the world. That the former do exist, with some years' more training than Pecksniff seems to have had, is obvious, but the class is not numerous. That there are many of the latter, however, no man of experience in the profession will deny. I know one notorious member of the family whom both Mr. Bonner and I have served in the past. He was a F.R.I.B.A. and once figured in your series of "Men who Build." I believe I am safe in saying that during the whole course of his professional career (he joined the majority some time since) he never made a single design, although he enjoyed an income, in my time, of about £3,000 a year from his practice, which was almost entirely the result of competition work gained for him by others.

Does not such an instance form a strong argument for registration, which would give a governing body powers to deal drastically with such men, instead of being, as the Institute is and always has been, an impressive-looking animal with its teeth drawn.

I have not indulged much on my own account in competitions, but when I did my experience of the Institute assessor was discouraging. Here is an instance. A work to cost £5,000 was awarded to a man whose design, cubed at a low figure—4d., I think—worked out at £10,000, and the lowest tender subsequently obtained exceeded that amount. Result: scheme abandoned.

With regard to unlimited competitions, I remember in my personal experience about 450 designs sent in for a small job. Result: most commonplace design accepted, to the accompaniment of howls of indignation from all the building journals.

I believe registration—or, in other words, a close profession—is the only cure for the ills from which we suffer, both from unsatisfactory competitions and adventurers of the Pecksniff order, as in the first place it would give the public a respect for the architect which at present it does not feel, and would consolidate the profession so that in matters of competitions it could enforce that respect, while in the other case it would strike off the rolls men who traded upon other men's brains and were guilty of dishonourable practices.

Though, for my part, I doubt if a finer design could have been obtained than that which Sir Aston Webb has produced for the Victoria Memorial, still I do not think it can be denied that for a national memorial the principle of the open competition is the right one; but that all competitions should be unlimited is, I think, an absurdity, and likely to be productive of most undesirable results.

Is it too much to hope that the Institute will drop its dog-in-the-manger attitude towards registration and, for the sake of the profession it claims to represent, put its back into the work and get the necessary Bill through Parliament? I trust not—Yours truly,
R. W. SAMPSON.

SIDMOUTH.

The A.A. Evening Studio.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—My attention has been called to the comment on the above in your issue for last week. In a letter received by me on April 4th last, the A.A. Council write: "It has been definitely decided to amalgamate the evening studio with the evening school, as it is evident that the evening studio can never be self-supporting now the day school is so firmly and successfully established. While there is an increased attendance at the day school, it follows naturally that the entries for the evening studio must decrease. The Council has therefore come to the conclusion that this change must be made after the close of the current session."

From this I understand that the evening studio has ceased to exist, and students would be asked to join the evening continuation school, which was established to carry on the work of the day school. I therefore hope you will see your way to inserting this letter in your next issue, as I think that the statement I made was a perfectly fair inference from the Council's letter: the fact that students of the evening studio are now invited to join the evening continuation school only emphasizes the accuracy of my conclusion.

I invited the hon. secretaries to attend the last meeting and state what provision would be made for students to carry on their work. Had this been done the matter would have been clear.—Yours truly,
WILLIAM G. B. LEWIS.

LONDON, N.E.

TWO NEWCASTLE BUILDINGS.

ON his visit to Newcastle-on-Tyne next week His Majesty the King will formally open two important new buildings just completed there. These are the new infirmary and the Armstrong College extension. The architect of

The New Infirmary

is Mr. H. Percy Adams, F.R.I.B.A., with whom is associated Mr. W. Lister Newcombe, F.R.I.B.A., of Newcastle. The general scheme comprises an administration building centrally placed, with eight ward pavilions grouped on either side, and the usual other buildings disposed about the site. The main front faces the Leazes Park. The ward pavilions are two storeys high and are arranged with the surgical wards (and operating theatres) on the ground floor and the medical wards on the first floor. The central hall of the administration block is panelled throughout with teak and leather, with plaster enriched ceiling and emblazoned arms on the windows. On the highest part of the site is the nurses' home, a fine block providing eighty bedrooms for nurses and six for housemaids. The ward pavilions are not less than 80ft. apart, and being axially north and south secure a maximum of sunlight and air. All the large pavilions are similar in detail, being designed for twenty-four beds each. Next to the entrance of the ward on one side is the ward kitchen and on the other the sister's room; a day room with bay window is provided to each ward, also two single-bed wards, examination room, linen-room, small larder, and a room for patients' clothes.

The ward walls are lined with pale blue tiles to a height of 5ft., cemented above and finished with enamel paint. Floors are laid with teak blocks, wax polished, and all angles and corners rounded. The windows have double-hung sashes with a low deep rail so as to ventilate at the meeting rail, with a hopper above having glass sides. At the end of the wards on one side are the bathrooms and on the other side sink rooms and w.c.'s, these annexes being cut off by cross-ventilated lobbies. Each large ward is 102ft. by 27ft. by 13ft. high, containing 35,802 cub. ft., or 1,500 cub. ft. per bed. The wall-space is 8ft. from centre to centre of the beds. The children's wards are only 24ft. wide, and the walls are lined with tile pictures. The wards are heated by open stoves and hot-water radiators; exhaust flues are arranged next the ceiling, each ward having independent flues.

The large operating theatre is octagonal in shape and has a marble gallery for students entered from the main first-floor corridor; underneath is a lecture theatre accommodating 100 students.

Perhaps the most successful part of the whole scheme is the chapel with its dome lined with gold mosaic. The library is also admirably designed.

A special series of thirty full-page illustrations of the new infirmary will be included in THE ARCHITECTURAL REVIEW for July, ready on Monday next.

The Armstrong College.

The other building to be opened by His Majesty is the extension of the Armstrong College, between the Leazes Common and Barras Bridge. This extension comprises the principal front, 300ft. in length, with the Sir Lowthian Bell Tower (120ft. high) and the examination hall. The buildings are four storeys high. The examination hall, 70ft. by 50ft., is on the ground floor, while on the first floor are the library (60ft. by 45ft.) and various classrooms, with other classrooms and laboratories on the floors above. Mr. W. H. Knowles, F.S.A., of Newcastle, is the architect for the work, and Mr. T. Lumsden the builder, the contract amounting to more than £50,000. The first portion of the college was opened in 1888, comprising the north-east wing; the south-east and south-west wings having been opened in 1894. The north-east wing contains the Herschel physical laboratory, the Johnstone chemical laboratory, the Armstrong electrical laboratory, &c.; the south-east wing includes the Royal Jubilee Exhibition tower; and the north-east wing accommodates the George Stephenson engineering laboratory.

ARCHITECTS IN RUTS.

THERE is always a big difficulty in trying to get life into anything technical, but somehow or other the Americans seem to "get there" very often. Here is an example of the latest we have come across, from a paper which we have never heard of before—the "New York Commercial":—

Architects certainly run in ruts, but then who does not? A certain form of plan of a house, and well suited for a certain locality, happens to strike the fancy of a man. He likes it and tells his architect so, and that gentleman is going to work that plan for the remainder of his days. He is going to work it in the country, in the city; he is going to try to make a church out of it, or a bowling alley. There seems to be little resourcefulness in the composition of the average practitioner. He runs in ruts, and besides that is inconsistent in little things and in big things. If he happens to see some glass effects, for instance, that please him, he goes daft on glass effects, and puts some particular glass decorator upon every one of his clients, and the result is that you will see a lot of buildings literally plastered over externally and internally with glass mosaic, stained glass, glass everything. Or it will be iron, and then you will have grilles and wonderful interlacings of iron, and in the most unforeseen and extraordinary places.

The Little Inconsistencies.

Not only is there lack of real taste in this thing, but gross inconsistency. For instance, how many houses will you see in the city with front windows, even the basement ones, beautiful expanses of plate glass, absolutely unprotected? Then, right alongside of them will be the doorway, with perhaps two dimunitive windows lighting the hall flanking that doorway. The glass in the door and in the windows, yes, even in the transom over the door, will be most artistically protected with bristling, spiked and riveted and strongly welded iron or bronze gratings. Some think it pretty, but the natural purpose of all this protection would seem to be to keep out burglars and uninvited guests. What keeps them out of the other windows?

Architects on Hire.

The profession has made great strides, but a lot of its practitioners certainly are behind the times, with scant resourcefulness. And this has its effects upon the people. They are not satisfied. They study and observe and are getting into the notion of trying to find out for themselves what they do want and what is the proper thing, and the result is that many a man or woman makes his or her own plans and "hires an architect to design a front."

It is only a question of time when he will be dispensed with for even that. There was a time, and still is occasionally, when an architect is high lord executioner and everything else on a building, but in probably one-half the big building projects to-day the owner deals very directly with prominent construction companies and has an architect to do a portion of the technical work and visit the building as more or less of a formality: and it would also seem to be but a question of time when such companies will employ their own specialists, designers, &c., and the architect as an independent practitioner will be a matter of bygones, a sort of Anno Domini affair. It really behoves the the profession to wake up.

NEW LONDON BUILDINGS.

AT yesterday's meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics* :—

Extension of the periods within which the erection of detached houses on the east side of Mycenæ Road, Westcombe Park Road, Greenwich, was required to be commenced, on the application of Crickmay & Heath. (*Consent.*)

Wood and glass conservatory over the entrance porch at No. 1, College Terrace, Fitzjohn's Avenue, Hampstead, without the walls under such conservatory being thickened, on the application of R. Smith & Son, on behalf of Dr. H. Roger Smith. (*Consent.*)

Two-storey building in front of No. 2, Loampit Vale, Lewisham, on the application of Stocker & Roberts, on behalf of A. C. Coates. (*Consent.*)

Wooden porch in front of No. 50, St. German's Road, Forest Hill, on the application of S. C. Haine, on behalf of J. Taylor. (*Consent.*)

Deviation from the plan approved on 17 October, 1905, for the erection of a projection stone porch and balcony at No. 51, Upper Brook Street, St. George, Hanover Square, so far as relates to the erection of glass screens at the sides and iron gates in front of the porch, on the application of R. G. Hammond, on behalf of J. Garlick. (*Consent.*)

Porches in front of houses in Stapleton Road, Wheatlands Road and Tooting Bec Road, Wandsworth, on the application of W. C. Poole, on behalf of F. Eaton. (*Consent.*)

Retention of a showcase in front of No. 18, Beauchamp Place, Brompton Road, Kensington, on the application of Pauline & Co. (*Consent.*)

Additions to No. 24, Cottesmore Gardens, Kensington, to abut upon Stanford Road, on the application of F. E. Williams, on behalf of F. Arnold Baker. (*Consent.*)

Retention of a conservatory addition at the rear of No. 179, Hither Green Lane, Lewisham, to abut upon Ennersdale Road, on the application of F. N. Shillingford. (*Consent.*)

Bakehouse at the rear of No. 1, Central Market, Stanstead Road, Catford, to abut upon Fermor Road, on the application of Norfolk & Prior, on behalf of E. W. Hodge. (*Consent.*)

Oriel window at No. 60, Fenchurch Street, City, to abut upon Fenchurch Street and London Street, on the application of J. S. Gibson, on behalf of J. Carmichael. (*Refusal.*)

Two storey building with stable at rear on the southwestern side of Moyser Road, Streatham, with the flanks in advance of the line of buildings in Nimrod Road, on the application of H. R. Thorp. (*Refusal.*)

One-storey shop in front of No. 2, High Street, Kensington, on the application of A. Mitchell-Husbands, on behalf of F. W. Bateman. (*Refusal.*)

Projecting shelter at the Hammersmith District Railway Station, The Broadway, Hammersmith, on the application of J. Carter, on behalf of the Metropolitan District Railway Co. (*Refusal.*)

Retention of four one-storey shops in front of Nos. 65, 67, 69 and 71, Westcote Road, Streatham, on the application of J. Harding. (*Refusal.*)

Open wooden porch at "The Lymes," Dulwich Wood Park, Dulwich, on the application of W. Griffiths, on behalf of J. Bowyer & Co. (*Consent.*)

Clock tower in the centre of St. George's Circus, Southwark, on the application of J. F. Groll, on behalf of W. B. & F. Faulkner. (*Consent.*)

Three oriel windows to Nos. 13, 13A, 14 and 15, York Buildings, Adelphi, on the application of Thompson & Walford, on behalf of the Clinical Research Association, Ltd. (*Consent.*)

New out-patients' department and nurses' home at the West London Hospital, Hammersmith Road, with the external walls at less than the prescribed distance from the centre of the roadway of Elm Grove, on the further application of W. Harvey, on behalf of the Committee of the West London Hospital. (*Refusal.*)

New street for carriage traffic to lead from Chatsworth Road to Idmiston Road, Norwood, on the application of C. J. Bentley, on behalf of himself and the trustees of the late Charles Blake. (*Consent.*)

New street for carriage traffic to lead from Idmiston Road to Lancaster Road, Norwood, on the application of C. J. Bentley, on behalf of himself and the trustees of the late Charles Blake. (*Consent.*)

Modification of the provisions of that section with regard to open spaces about buildings, so far as relates to the proposed erection of Nos. 12 and 14, Manwood Road, Brockley, with irregular open spaces at the rear, on the application of H. Lillywhite. (*Consent*)

Buildings abutting upon a proposed street for foot traffic only, to lead from Southampton Road to Vernon Place, Holborn, the said buildings to exceed in height the width of such proposed street, on the application of R. J. Worley, on behalf of the Selected London Properties Co. (*Consent.*)

The Theatres and Music Halls Committee also reported the following :—

Drawings submitted by E. Monson & Sons, showing certain proposed alterations and additions to the St. Clement's Parish Hall, Fulham Palace Road. (*Consent.*)

Drawings, submitted by W. D. Caroe, of the Working Men's College in Crowndale Road, St. Pancras. (*Consent.*)

At last week's meeting of the Council the following applications were reported :—

Retention of a photographer's showcase erected on the forecourt of No. 154, Holland Park Avenue, Kensington, on the application of A. Langfier. (*Consent.*)

Bay window, balconies and porch at No. 1, Albert Terrace, Regent's Park, on the application of S. G. Castleman, on behalf of Sir William Collins, M.P. (*Consent.*)

Buildings on the western side of Thrale Road, Streatham, southward of Clairview Road, on the application of W. Bartholomew, on behalf of Antill & Squires. (*Consent.*)

Retention of a projecting illuminated sign at the "Red Cow" public-house, Hammersmith Road, Hammersmith, on the application of Bull & Bull. (*Consent.*)

Retention of an iron and glass shelter at the Adelphi Hotel, John Street, Adelphi, on the application of Jeffries & Co., on behalf of Flower & Sons, Ltd. (*Consent.*)

Four houses on the eastern side of Garrad's Road, Wandsworth, between Tooting Bec Road and Prentis Road, on the application of J. S. Gibson, on behalf of J. Carmichael. (*Refusal.*)

Shop front in the passage-way leading to the railway arches (Nos. 33x and 34x) on the western side of Brixton Road, Brixton, and the roofing over of a portion of such passage-way, on the application of H. Tanner, jnr., on behalf of S. Sanders & Co. (*Refusal.*)

Shop front in front of the railway abutment between Nos. 456 and 462, Brixton Road, Brixton, on the application of H. Tanner, jnr., on behalf of Sanders & Co. (*Refusal.*)

One storey motor-house and an iron and glass covered way at No. 20, St. John's Wood Road, St. Marylebone, to abut upon Grove Road, on the application of A. W. G. Harding. (*Refusal.*)

Addition at No. 3, Acacia Road, St. John's Wood, on the application of W. R. Phillips, on behalf of J. M. Swan, R.A. (*Refusal.*)

Covered way in front of No. 36, Abercorn Place, St. John's Wood, on the application of J. Danson, on behalf of A. Wood. (*Refusal*)

Retention of four one-storey shops in front of Nos. 65, 67, 69 and 71, Westcote Road, Streatham, on the application of J. Harding. (*Refusal.*)

Retention of the forecourt fence-wall in the front of three houses on the southern side of Bolton Gardens, South Kensington, at less than the prescribed distance from the centre of the roadway of such street, on the application of Cooper & Bake, on behalf of F. G. Minter. (*Consent.*)

Boundary fence at the "Hatcham" school for physically defective children, Canterbury Road, Old Kent Road, at less than the prescribed distance from the centre of the roadway of Wagner Street, on the application of T. J. Bailey, on behalf of the Education Committee of the Council. (*Consent.*)

Further deviation from the plan approved on July 11, 1905, for consent to the erection of a two-storey building on land at the rear of Nos. 20, 22, 24 and 26, St. John's Road, Battersea, with external walls at less than the prescribed distance from the centre of a roadway leading out of the south side of St. John's Hill, so far as relates to an alteration in the height of such two-storey building, and of the addition to such building, approved on March 27, 1906, on the application of E. S. Barr. (*Consent.*)

Working-class dwellings at the rear of No. 184, Camberwell Grove, Dulwich, to abut upon Stories Road, with external walls at less than the prescribed distance from the centre of the roadway of Stories Road, on the application of A. Laycock. (*Refusal.*)

Urinal in Cambridge Mews, Southwick Street, Paddington, at the rear of the "Marquis of Clanricarde" public-house, on the application of W. H. Collins, on behalf of the City of London Brewery Co., Ltd. (*Consent.*)

Retention of an oriel window in front of No. 7, Wood Street, City, at less than the prescribed distance from the centre of the roadway of such street, on the application of W. H. Waterman. (*Consent.*)

Nine houses with shops on the western side of Askew Road, Hammersmith, northward of "The Sun" public house, on the application of F. J. Brewer, on behalf of A. Gard. (*Consent.*)

Retention of an iron sign erected on the forecourt of Nos. 139A and 139B, Finchley Road, Hampstead, on the application of E. T. Morriss & Co. (*Consent.*)

Projecting balconies in front of a proposed building between Nos. 10 and 12, Bosworth Road, Kensington, on the application of Chapman & Shepherd, on behalf of the Bosworth Temperance Club. (*Consent.*)

Open porches in front of Nos. 1 to 23 (odd numbers only) inclusive, Kingsbridge Road, St. Quintin Estate, Kensington, on the application of Trant Brown & Humphreys, on behalf of Daley & Franklin. (*Consent.*)

Projecting bays with gables over, and porches to Nos. 19 to 65 (odd numbers only) inclusive, and Nos. 22 to 44 and Nos. 48 to 70 (even numbers only) inclusive, High Lever Road, St. Quintin Estate, Kensington, on the application of Trant Brown & Humphreys, on behalf of Daley & Franklin. (*Consent.*)

Retention of a greenhouse in the garden of "Hyndford House," Inglemere Road, Forest Hill, Lewisham, abutting upon Bampton Road, on the application of G. Hayward & Co. (*Consent.*)

Houses with shops on the western side of Norwood Road, and dwelling houses on the northern side of Trinity Road, Norwood, on the application of T. L. Fearon. (*Consent.*)

Retention of a projecting iron and glass shelter at the entrance to No. 152, Victoria Street, Westminster, extending beyond the general line of buildings in the street, on the application of G. Odone. (*Consent.*)

Retention of the bases to five projecting pilasters on the Piccadilly frontage and to five projecting pilasters on the Old Bond Street frontage of buildings upon the site of Nos. 44, 45 and 46, Old Bond Street, and Nos. 57, 58, 59 and 60, Piccadilly, on the application of Callard, Stewart & Watt, Ltd. (*Consent.*)

Obituary.

Mr. John Wills, architect, of Derby, died recently, aged 61.

Sir Wyke Bayliss, president of the Royal Society of British Architects, who died on April 5th, left estate which has been proved at £2,640.

Mr. Stanford White, partner in the well-known firm of McKim, Mead & White, architects, was shot in New York on Monday last week.

The late Mr. Joseph Gornall, builder and contractor, of Bolton, who died on September 23rd last, left property which has been valued at £20,000.

Notes and News.

The Palais de Justice, Paris, is to be enlarged.

Messrs. Measures Brothers, Ltd., constructional engineers, of London and Croydon, are paying an interim dividend at the rate of 5 per cent. per annum.

Restoration at Heidelberg.—Protests are being made against the proposals of the Baden Government to renovate the ancient castle of Heidelberg. The suggestion is that a roof shall be put over the ruined building of Otto Heinrich (1556), the finest portion of the edifice, and it is urged that the magnificent façade should be pulled down and rebuilt in detail, but on renewed foundations.

Work Abroad.—The July circular of the Emigrants' Information Office, 31, Broadway, Westminster, states that in New Zealand, at Auckland, the building trades absorb all efficient workmen, but no more are wanted. In Cape Colony the supply of labour is in excess of the demand, and the same applies to Natal. Workmen are warned, too, against going to the Transvaal at the present time in search of work.

Workmen's Compensation.—In the City of London Court last Thursday a bricklayer named Leman claimed £340 from Messrs. Patman & Fotheringham, Ltd., builders, for injuries caused through a brick falling upon him while in their employ on a building in Cheapside. Leman was having his dinner with his fellow workmen when the brick suddenly fell upon him from a board 35ft. above. He was awarded £150 compensation.

South-Western Polytechnic, Chelsea.—The lectures on architectural history given by Mr. Banister Fletcher, F.R.I.B.A., and arranged under the auspices of the University of London Extension Board, held during the past session, have been very successful. The total number of students who entered for the course was sixty. For the next session, which opens on October 1st, a series of visits to important buildings and museums around London is being arranged.

End of the Vienna Building Strike.—The lock-out in the Vienna building trade has been ended, after seven weeks. It affected about 60,000 men and women—women being largely employed in Austria as bricklayers' assistants. Although the employers' ring has successfully resisted the bricklayers' demand for a minimum daily wage of five kronen (approximately 4s. 2d.), it has been obliged to concede 4·66 kronen (3s. 10½d.) for the rest of the current year and the first four months of next year, and to promise a wage of 5·4 kronen (4s. 2½d.) for the remainder of 1907 and the whole of 1908. The highest previous wage was four kronen (3s. 4½d.).

A new Roman Catholic Church at Godalming, dedicated to St. Edmund, has just been completed.

Bruce House, now being completed in Kemble Street, near Drury Lane Theatre, is a kind of "Rowton House," built by the London County Council. It is five storeys in height, excluding the basement, and is built of red brick relieved with Portland stone dressings. Accommodation is provided for 699 working men.

The Queen's Sanatorium.—Plans for this building, to be built at Davos, have now been definitely adopted, the architects being a Zurich firm. The building will provide about sixty beds, with public rooms and offices adapted for eighty or more in addition. The total estimated cost of building and furnishing is £22,000, towards which £17,500 has still to be collected. It is hoped to begin building next spring.

Westminster Abbey: Reparation of Stonework.—Repairs to the outside stonework of Westminster Abbey have just been commenced, and will take about five years to complete. A start has been made on the clearstory of the north transept, where extensive scaffolding is being erected. The decayed Bath stone is to be replaced by Portland stone. Mr. Micklethwaite is the architect in charge.

Architectural Models.—We have received from the London Drawing and Tracing Office, 98, Gray's Inn Road, W.C., a handy little booklet on models of buildings, &c. Mr. John B. Thorp, who makes a speciality of these, has prepared a large number of models for architects, especially of models in connection with light and air cases. His work is carried out in a most careful way, and as the use of models is now becoming so common we have no doubt that many readers will be glad to know where they can get them prepared.

Dry-rot: The Legal Aspect. — In the "Law Times" for June 23rd is an article dealing with the removal of dry-rot, in its legal aspect. A summary of cases affecting the question is given. It is often a delicate point to decide as to who shall bear the expense of remedying dry-rot when it has been discovered, and the cases suggest that the task of getting the Courts to sanction the expenditure of capital for the purpose is not by any means an easy one, except where the work can be brought within the ambit of "alterations" to facilitate letting, or within the limits of the indulgence extended to cases of rebuilding a mansion-house.

Rebuilding of St. George's Hospital.—At a meeting of the governors last week the question of the removal or the rebuilding of St. George's Hospital at Hyde Park Corner was discussed. Mr. A. W. West, one of the treasurers, stated that there were three alternative schemes—(1) To remain where they were, carrying on their work as well as they could, which would cost £37,700; (2) to buy up the leasehold interest of the houses at Knightsbridge, which would cost £120,000; and (3) to rebuild the hospital on the present site, which would cost £350,000. This last has been adopted. Mr. H. Percy Adams, F.R.I.B.A., is the architect for the rebuilding.

OUR PLATES.

Two West-End Houses.

The two West-End houses illustrated in this issue have recently been built on the Howard de Walden estate, for private clients, from the designs of Mr. W. Henry White, F.R.I.B.A., of No. 14A, Cavendish Place, W. No. 27, Harley Street was built by Mr. George R. Shaw, of No. 8, Wigmore Street, W., and No. 25, Queen Anne Street, by Mr. D. Prosser of No. 23, Charlotte Street, W., and in each case the work has been extremely well done. The perspective views are hung in this year's Royal Academy exhibition.

GARGOYLES.

RELATIVELY unimportant compared with many other features of Gothic, the gargoyle has always appealed to popular fancy. It is a detail than can scarcely be overlooked, owing to its position and the grotesque forms it has been made to assume.

There is something fascinating in the appearance of a cathedral church during a rainstorm, when the whole building is alive with little jets of water issuing from the jaws of dragons and wyverns, goblin birds and writhing cobolds.

The number and variety of roofs on Gothic churches of large extent, and the need of draining even much smaller surfaces than are found on the actual roofs, are supposed to furnish the reason for the many spouts that end in gargoyles, or have gargoyles associated with them as a decorative feature. As the Gothic developed, gargoyles increased with the greater care expended on decorations and the protection of the stonework.

But it is not necessary to speak of gargoyles in the past tense, for they are commonly introduced on modern churches, and occasionally are still in demand for secular buildings. It is true that modern construction for the relief of roofs from water, combined with modern drainage, no longer exacts the decorated waterspout as a working feature. They need be "practical" no longer. But for three centuries the gargoyle remained so fixed a feature of Gothic architecture that a decent feeling for consistency demands its presence in modern examples, just as the hat retains its band and the coat its lapels, though band and lapel are no longer working parts. The once useful feature has become an integral part and holds its own as a decoration.

It would be difficult to say when the gargoyle first made its appearance; perhaps in opposition to the view of Viollet-le-Duc it was coincident with elaborate stone structures, and in a less striking form belonged to the Romanesque before it blossomed in the Gothic.

Nowhere more clearly than in the gargoyles of Gothic churches does one perceive that a wooden prototype has been repeated in stone. It is plain that a log bored or channelled lengthwise to form a waterspout has been finished in some eccentric shape—a chimæra, a harpy, a nondescript beast—and when required for a structure all in stone has been transferred to that material.

At the same time it is worth noting that we have no certain records of gargoyles until after the Crusades, and that fact leads us to the Orient for the fashion in gargoyles that meets us in the thirteenth century. Greek and Roman architecture are not without examples. But it is in the extreme Orient that we find exact parallels—in Ceylon, rainy Burmah and Siam.

Taken by themselves, divorced from their subordinate positions, gargoyles strike us a trifle coarse with the grotesquery of their distorted masks and muzzles. But seen in connection with the figures of divine beings and saints as they stand on their pedestals under their canopies, the whole combining to make a façade such as that of Rouen or Chartres appear like an intricate field of lacework, the gargoyles form a contrast at once pleasing and in harmony with good sense; they are minor parts of a great intricate whole, and should not be thought of separate from the other sculpture.

Enquiries Answered.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

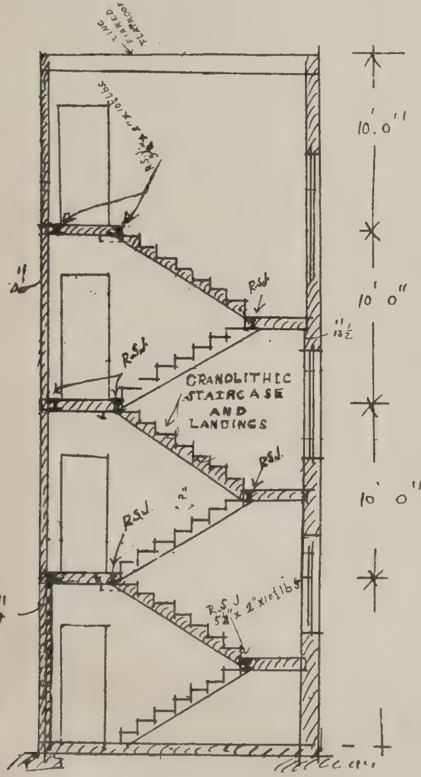
Underpinning Old High Wall on Bad Ground.

N. C. writes: "Which is the most economical and safest manner in which to underpin two brick walls of an old building? The brickwork is bad. The walls in question are about 6oft. in height, but are not carrying any floors or roof. They stand on a clay and soft sandy soil. The purpose for the underpinning is to place new concrete foundation under the walls."

This is a case in which advice can only be given after a personal examination of the walls and site. HENRY ADAMS.

Stability of Staircase Walls.

London.—Old Reader writes: "Please give a simple method for calculating the weight of a granolithic and concrete staircase constructed as shown by accompanying sketch. (2) Would the internal 4½in. walls be sufficiently strong enough for the purpose?"



A half-brick wall 1oft. high without any load on it is bad enough, but in this case it is proposed to carry half-brick walls 3oft. high to support a granolithic staircase with a rolled joist at each landing. The weight of the steps and landings may be taken at 126 lbs. per ft. cube, and the live load upon them 84 lbs. per ft. super. If a pier to take the ends of the rolled joists is bonded to and built out from the walls, either in front or behind, of such section that the total load upon it at any level does not exceed 3 tons per ft. super., the structure may then be regarded as safe. HENRY ADAMS.

Soundproofing.

Noiseless writes: "Which is the more effective method of making a soundproof wooden floor—(1) laying hair bitumen felt between the joists and floor boards; (2) laying 1½in. layer of slag wool on rough boards between joists?"

You should do both, *i.e.*, put felt (it need not be tarred) under the joists, and use slag-wool pugging between. Another, and very effective method, would be to use Cabot's deafening quilt, supplied by Messrs. Arthur L. Gibson & Co., 19-21, Tower Street, Upper St. Martin's Lane, London, W.C.

Strixton Church.

Northants.—Cymro writes: "Is the east end of Strixton Church, Northants, suitable for measuring as a testimony of study for the R.I.B.A. intermediate examination?"

The east end of Strixton Church is a very suitable subject to measure for a testimony of study for the R.I.B.A. intermediate examination. It is very simple in character; but it is an exceedingly fine example of Early English work dating from 1220 A.D. There is much fine detail to be studied in this church. H. Y. M.

Architects' Charges.

S. H. S. S. writes: "A building has been erected from my plans, specification and quantities, but during the erection certain structural modifications were made, necessitating alterations to the plans and details, and the measuring-up of the whole of the works. These alterations were ordered by the clients, and in no way is it suggested that I was responsible for them. There are numerous extras, but these were ordered and approved by my clients, who are perfectly satisfied, and the total cost (between £3,000 and £4,000) comes well within my original estimate. Can I reasonably charge (1) a lump sum for altering plans, &c.; (2) a percentage for the second bill of quantities? If so, what would be a fair charge? My own idea is 25 guineas for the former and 2 per cent. for the latter."

The Royal Institute of British Architects has sanctioned a scale of fees, and it has been generally accepted and has been in force since 1872. I advise you to procure a copy. You are only entitled to charge percentage for one bill of quantities, and that should be the "bill" for the work actually executed. You are, however, entitled to charge a fee for special work and for measuring and adjusting extras and omissions. Your charges appear to be fair ones, but 2½ per cent. is more usual than the 2 per cent. you mention. F. S. I.

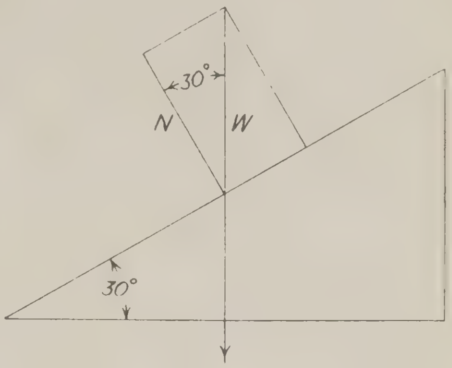
Painting and Papering Clauses in Lease.

Portsmouth. — Mecca writes: "(1) In some hotel premises most of the woodwork has been grained and varnished (much of it quite recently) and is in a generally good condition. Under terms of expiring lease lessor can require painting two coats in last year of period. Can he also require regraining and varnishing? (2) Papering is not specifically mentioned, but some of it is bad, including some papers now varnished. In repapering, must new papers be varnished where present ones are?"

(1) I am of opinion that if graining is not specifically mentioned in the lease, it cannot be insisted upon (on quitting) under an ordinary painting clause. If the lessee is liable for repainting it is customary either to paint the grained work (if much defaced) as the other work, or to touch up and re-varnish it if in good enough condition. (2) Papering has to a large extent been regarded as merely "decorative" work, and a lessee's liability under this head is not a heavy one. If there is no special mention of repapering it is somewhat doubtful whether such work can be required at all. It was laid down in the case of *Proudfoot* v. *Hart* in 1890 (L.R. 25 Q.B.D., 42) that "if repapering is necessary, tenant need not put on a paper of equal value to the old; his paper need not be of a richer character than would satisfy a reasonable man within the definition." I am of opinion, therefore, that the "varnishing" cannot be insisted upon. F. S. I.

A Problem in Mechanics.

London.—Subscriber writes: "A body of mass 10 lbs. is placed on a rough plane whose coefficient of friction is $\frac{1}{\sqrt{3}}$ and whose inclination to the horizon is 30 degs. If the length of the plane be 4ft. and the body be acted on by a force parallel to the plane, equal to 15 lbs. weight, find the time that elapses before it reaches the top of the plane."



There appears to be a little doubt as to the terms of the question. A mass of 10 lbs. is resting on the plane, and a force of 15 lbs. weight is drawing it up the plane. Assuming that mass and weight are used synonymously, I should work as follows: $-N = W \cos 30$, $\mu = \frac{1}{\sqrt{3}}$. Retarding force $= W \cos 30 \times \frac{1}{\sqrt{3}} = 10 \times \frac{\sqrt{3}}{2} \times \frac{1}{\sqrt{3}} = 5$ lbs. Force free to act $= 15 - 5 = 10$ lbs. $a = \frac{f}{M} = \frac{10}{10} = 1$ft. per sec. $s = \frac{at^2}{2}$. Therefore $t = \sqrt{\frac{2s}{a}} = \sqrt{\frac{2 \times 4}{1}} = \sqrt{8} = 2{\cdot}828$ secs.

HENRY ADAMS.

Lead Waste for Lavatories.

New Wandsworth.—H. F. writes: "Would you recommend lead waste pipe for lavatories and sink where hot water is used on six floors? If so, what size and weight of pipe, and how fixed? What weight for 2in. (internal diameter) lead waste pipe per foot run? Sketch sent (not reproduced)."

The vertical main down-pipe on the wall had better be of cast-iron, as the great weight of lead for the 70ft. or so of height will be difficult to hold up, and the downward drag tends to open the joints. If lead be used the thickest and strongest should be at the top, and it should be lessened at every floor and a half, or at most every two floors, as it goes down. The weights may be 20, 15 and 10 lbs., or the nearest obtainable in your district, for the top, middle and bottom lengths; the tacks or clasps to the wall may be at 3ft., 4ft. and 5ft. centres respectively. Bends of a good size in the pipe from basin to main will take all the expansion due to hot water. O. W.

American Partition Slabs.

Clapham Common.—A. H. A. writes: "Kindly give me some information respecting various American fire-resisting partition slabs (fireclay or terra-cotta), with the names and addresses of the British agents for same."

We can only recollect one American block partition that has been put on the English market. That is a terra-cotta one supplied by the National Fireproofing Co., whose address is 27, Chancery Lane, London, W.C.

Measurement in Canada and the States.

COATBRIDGE.—C. L. writes: "Is there any particular 'mode' of measurement in Canada or U.S.A.—whether for a slump sum or measurement after erection, or whether the tradesmen measure the work themselves?"

The contractors almost invariably take out their own quantities.

Paint for Roof.

MARKET RASEN.—R. F. G. writes: "Which is the best paint or other material to use for the preservation of a corrugated iron church roof which has not been painted previously?"

There are several rustproof paints on the market which we could recommend. One of the best is Messrs. Wailes, Dove & Co.'s "Bitumastic" enamel and solution.

Books on Physics and Mechanics.

WIGAN. — A STUDENT writes: "What books on physics and mechanics are most suitable for the R.I.B.A. preliminary examination?"

"Lessons in Elementary Physics," by Balfour Stewart, and "Elements of Mechanics," by Mansfield Merriman (price 4s. 6d. each post free from our offices).

Building Trade in Canada.

COATBRIDGE.—A. G. writes: "I am an architectural draughtsman. Can you advise any particular town in which building trade is good in Canada?"

There is plenty doing all over Canada. You would find it useful to apply to the Canadian Emigration Office in Whitehall for information. We should not advise the older towns in the east, but would suggest striking out west, say, to Regina, the capital of Saskatchewan, or Edmonton, the capital of Alberta.

Position in County Architect's Office.

DARLINGTON.—H. B. writes: "I am desirous of obtaining a junior position in one of the county council architectural offices, in Yorkshire or Durham if possible, preferably for school work, of which, however, I have no practical experience. I am twenty-three years of age, and have been mostly engaged on domestic and alteration work to country hotel and inns. (1) Do you advise me to try for such a post? (2) How is admission gained? (3) To whom should I apply in the counties of Yorkshire or Durham?"

(1) Yes, by all means. (2) By applying in answer to advertisements, writing or calling to show examples of your work in view of possible openings. (3) The surveyor to the East Riding County Council, Beverley; the surveyor to the North Riding County Council, Northallerton; the County Architect to the West Riding County Council, Wakefield; the surveyor to the Durham County Council, Durham.

Knotting in Paintwork.

PIETERMARITZBURG. — NATAL writes: "Why is it that knotting (or is it the resin from the knots?) works through paintwork a few months after completion? This has happened in many instances in local work, and painters attribute it to the climate and say it cannot be prevented. In some instances it has happened where the knotting appears to have been properly executed. Would it be the fault of the knotting or the method of application?"

The trouble is due to the hot climate, which overcomes the resistance of the shellac varnish to keep in the resin. Large knots or those running with resin should be cut out and replaced by sound wood, but with small knots resort may be had to tinfoil, which should be stuck over the knots with shellac varnish before painting.

Park Pavilions.

ASSISTANT writes: "What are the general requirements for a pavilion or shelter, with caretaker's house, in a small public park? Have designs for the above appeared in any of your back numbers?"

We have only published photographs, without plans, of park pavilions. It is not always advisable to combine the park keeper's house with the pavilion. If the site necessitates it, the house should be at the back of the shelter, so that the residents may not be overlooked. The lodge if separate will prevent this, and yet enable the park keeper to survey the park to some extent, and so see if his services are needed. The pavilion may be simply a shelter, or may have refreshment-rooms, waiting-rooms and conveniences. It all depends upon local circumstances.

Rough-cast.

PLYMOUTH.—ROUGH-CAST writes: "What are the best materials and proportions for rough-cast on hollow brick walls to finish white?"

Walls constructed with a single thickness of hollow brick blocks would be better coated with Portland cement rough-cast than with the usual lime rough-cast, although the latter offers considerable resistance to damp if well done. We suggest a rough-cast made of 2 Portland cement, 1 gravel, 2 of white limestone dust and $\frac{1}{10}$th powdered whiting or ground chalk. There is no necessity to apply in two coats (as is advisable with lime rough-cast) if only the hollow-blocks are keyed or grooved on the surface, or brick-joints are raked out, and the surface is clean and thoroughly wetted.

Efflorescence on Brickwork.

LEE.—SUBSCRIBER writes: "What is the cause of the white substance appearing on the face of red brickwork?"

This is known as efflorescence, and is variable in composition. It may be due to salt, gypsum or magnesia, singly or together. These are all soluble and crystallize on the face. In time, of course, the efflorescence will disappear.

Buildings to Study near Darlington.

DARLINGTON.—A STRANGER writes: "I am staying in Darlington for a short holiday and would like to measure some buildings of architectural interest in or within a short walk of the town. Please mention some."

After Durham Cathedral, St. Cuthbert's Church, Darlington, is one of the finest and most spacious ecclesiastical buildings in England and is of special interest to architects as exhibiting very clearly the transition from the Norman to the Early English style. The tower was built above the roof ridge and the spire added in 1350-1375; the weight caused the piers below to give way, which led to the walling up of the two windows in the south transept and to the erection of a massive rood-loft to give strength to the piers. The lepers' window, the bold and massive carved choir stalls and the "Easter Sculpture" should be specially noticed. The church of Haughton-le-Skerne contains some Norman work. The balustraded seventeenth-century piers, the tower and fragments of wonderful Saxon crosses at Aycliffe Church are worth noting. The quadruple shafts and foliated caps (restored) of the nave arcading of Sedgefield Church, which place is about 10 miles by rail from Darlington, are worth studying. This church also contains some good Decorated and Elizabethan work. Heighington Church has some Norman windows in its towers and a fine Norman arch to the chancel decorated with a billet label. There is also a fine pre-Reformation pulpit here. High Coniscliffe Church is chiefly of the Early English period with a good spire and some beautiful carved choir stalls. Gainsford contains a church dating from about 1200 A.D. Croft Church is chiefly Decorated in style, with some good sculpture in the chancel. Portions of the church are of Norman date. The fine Decorated sedilia and piscina are well worth measuring or sketching. H. Y. M.

Architectural Tours.

NORTHERN writes: "I should be glad if you could suggest subjects of study for a ten days' architectural tour in the vicinity of (1) Norwich and (2) Gloucester, it being intended to use one of these places as a centre of operations."

Norwich cathedral contains work of the Norman and all the Gothic periods. Norwich Castle is a very fine example of Norman fortified work. The council chamber of the Guildhall contains the fittings of a "Court of Justice," which remain almost exactly as in the days of Henry VIII., having carved panels, stained glass and an open timber roof. St. Andrew's Hall, formerly the nave of a Dominican convent church, is a fine example of late Perpendicular work. The three portals, known as the Erpingham Gate, St. Cuthbert's Gate and the Bishop's Gate, are well worth studying. The Bishop's Palace contains work of the Norman, Early English and Decorated periods. The grammar school is worth a visit. Norwich contains more churches than any other cathedral city in England, there being thirty-five in all, which are for the most part Perpendicular in style, ranging in date from 1350 to 1500; many of them possess lofty towers. The most interesting of these churches are St. Peter's Mancroft and St. Andrew's, but most of the others are worth studying. Carrow, a suburb of Norwich, contains the remains of a fine Benedictine Priory. Magnificent coloured and carved wood screens are to be found at Ranworth and Fritton churches. Fine churches are also to be found at Acle, Winterton, East Dereham, Ludham, Yarmouth, Oulton, Lowestoft, Beccles and Wickhampton. Haddiscoe Church possesses one of the finest round towers in the country. At Gloucester there are the cathedral, the deanery, the palace, and three fine churches. The cathedral contains work of the Norman and the three Gothic styles. The Norman chapel of the deanery is well worth studying. The palace is chiefly of the fifteenth century, and contains a fine Decorated room known as the Abbot's Hall. The church of St. Mary de Crypt is chiefly of Perpendicular date with Early English and Decorated portions. The only remains of St. Mary de Lode are the tower, the chancel, and a curious wooden pulpit. The church of St. Nicholas contains work of the Norman, Early English and Perpendicular periods. The priory of St. Oswald is interesting, being of an Early French character with an apsidal chapel. Round about the church of St. Mary are remains of the Grey and Black friars. Under the Fleece Inn is a crypt of the twelfth century. A Perpendicular vault is to be found under the Saracen's Head Inn. New Inn in Northgate Street contains some fine chestnut timber work of the thirteenth century with some curious antique carving. At Deerhurst is a good example of a Saxon church. Bridgeworth Church is a fine example of work of the Decorated period. Norman and Perpendicular work are to be found at Barnwood Church. A church built in the reign of Edward III., containing an example of a Norman font, is to be seen at Leckhampton. A graceful Decorated spire is to be found at Standish Church. Hempstead Court, which is of fifteenth-century date, contains some fine art treasures. Hempstead Church possesses a Perpendicular tower of rather peculiar construction and a good Decorated chancel. Matson House is an example of Elizabethan architecture. Brimpsfield Church is worth a visit. If the Gloucester district is chosen for your tour, a visit should be arranged to Tewkesbury Abbey. H. Y. M.

MILAN EXHIBITION.

ON this page we give a photograph of the "Pavilion of the Simplon," which forms the chief entrance to the exhibition now open at Milan. This is, of course, quite of the exuberant exhibition class of architecture, but in these buildings there are none of the sobering influences which control buildings for serious life. The general effect of this entrance block is rather happy, though some of the detail is far from pleasing—as, for example, on the capitals of the piers; but here and there about the façade there are a great many *motifs* treated in a fresh manner. Sculpture has been brought into play considerably, the Rodinesque feeling predominating, but the figure of wingèd Mercury seems too classic for juxtaposition with the works of the latest Italian school. The majority of the other buildings of the exhibition, judging by the photographs we have seen, are purely rampant.

MANCHESTER NOTES.

(*By our own Correspondent.*)

THE Platt Hall Estate at Rusholme, Manchester, the finest open space so near the city, has been offered for sale and withdrawn at £46,300. The history of the estate dates back eight centuries. The present hall was built 142 years ago. The total area is seventy-seven acres, with a considerable frontage to Wilmslow Road, one of the finest roads out of Manchester. Mr. C. W. Previs, the auctioneer, stated that the sale was the most important since the Trafford Park estate was offered.

Mr. John Ely, F.R.I.B.A., of Manchester, has prepared plans for the new Hospital for Women and Children to be erected at the corner of Oxford Street and High Steeet, Manchester. The hospital is to accommodate 84 women and 27 children.

Mr. Hamo Thorneycroft, R.A., has reported to the committee of the Manchester War Memorial that the group, which is already in plaster, will be completed in six months. Mr. Thorneycroft's description of the memorial is as follows: "It consists of a group of two soldiers as in the midst of a hand-to-hand fight; one of them down on the ground wounded, resting on one hand, while with the other he hands his last cartridge to his brave and stalwart companion, who stands above with firmly planted feet and tightly gripped rifle in the action of defence. The figures are larger than life—what is known as 'heroic' size, about 6ft. 8ins.—and are placed on a rocky plinth about 2ft. 6ins. deep; so the whole group is about 9ft. in height. This will be placed on a granite pedestal, which will be enriched with panels inscribed with the names of the men of the Manchester Regiments who fell in the late war."

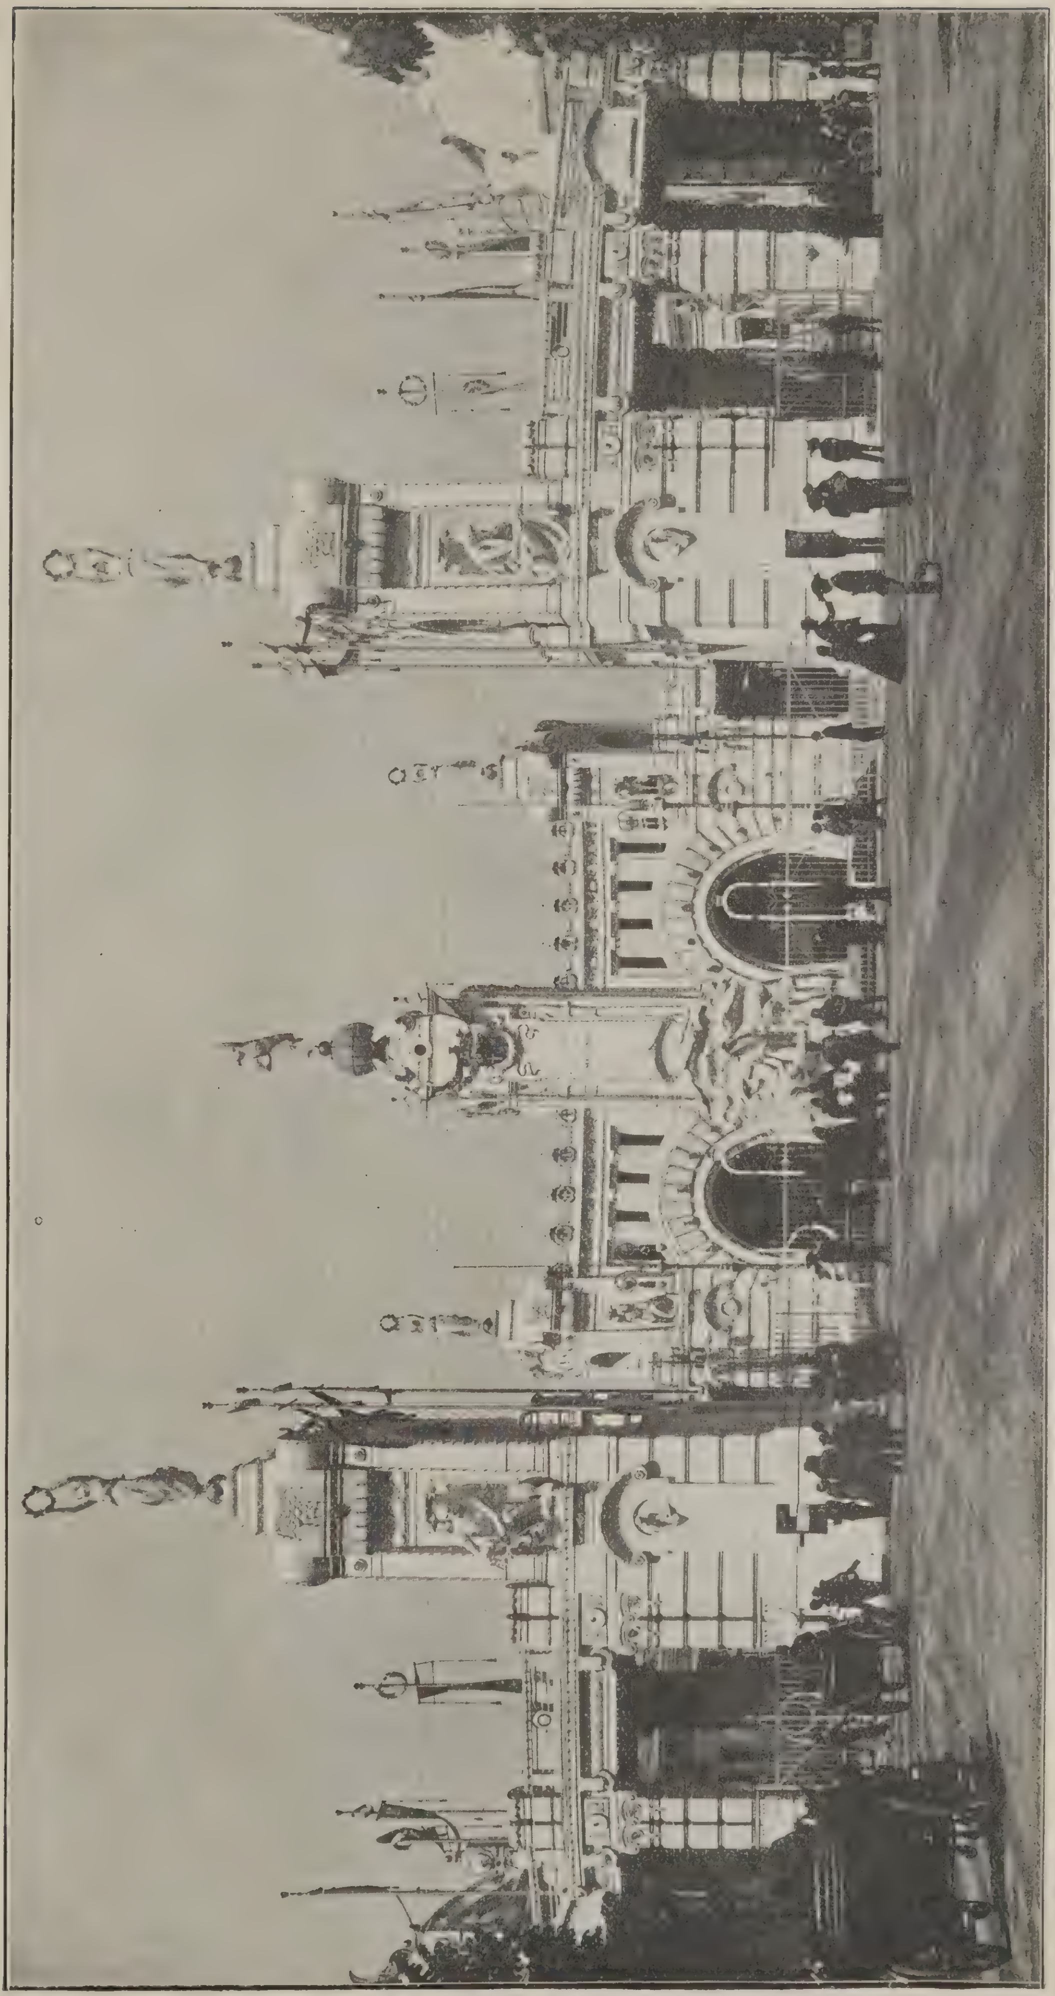


Photo: Romieux.

MILAN EXHIBITION: THE PAVILION OF THE SIMPLON.

Complete List of Contracts Open.

WITH a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

July 5. Beverley.—*Additions and alterations* to the Council School at Hemingbrough. Persons desirous of tendering for the work may see the drawings, specification and obtain forms of tender on application to the Building Surveyor, County Hall, Beverley, or at the above school during the usual hours. Tenders, endorsed "Hemingbrough School," to John Bickersteth, clerk to the East Riding Education Authority, County Hall, Beverley, not later than July 5.

July 5. Devonport.—*Erection of a new administrative building* at the Infectious Diseases Hospital, near North Prospect. Plans specifications, and conditions may be seen and forms of tender and quantities obtained on application to the Borough Surveyor, 29, Ker Street, Devonport, to whom tenders must be delivered, properly endorsed, on or before 10 a.m. on July 5. The sum of £1 1s. will be required as a deposit. Fair wages clause.

July 5. Bingley.—*Erection of a washhouse* at Bingley. Plans can be seen and quantities obtained at the offices of Samual Jackson & Son, Tanfield Chambers, Bradfield, from June 30 to July 5.

July 5. Dewsbury.—*Erecting about 217 yds. of brick walling* at the workhouse at Staincliffe. Specification and particulars to be obtained from the master of the Workhouse. Tenders to be delivered to Joseph Peace, clerk to the Guardians, Union Offices, Wellington Street Dewsbury, not later than July 5.

July 5. Belfast.—*Erection of workmen's cottages* on the Mill Town Road, Purdysburn. Plans and specifications can be seen at the offices of Young & Mackenzie, architects, Scottish Provident Buildings. Sealed tenders, endorsed "Tender for Cottages," to be lodged in the Town Clerk's Office, before 11 a.m. on July 5.

July 5. Cardiff.—*Erection of shops and premises* according to the plans of E. H. Bruton, F.R.I.B.A., Cardiff, for G. A. Spencer, The Square, Senghenydd, where plans and specification may be seen on June 27, and to whom tenders are to be sent not later than July 5.

July 5. London.—*Erection of* seven coal offices at Finchley Road, London, for the Midland Railway Co. Plans and specifications may be seen, quantities and particulars obtained on application at the Engineer's Office Derby Station. Sealed tenders to be forwarded by post to the Secretary of the Way and Works Committee, Midland Railway, Derby, not later than 9 a.m. on July 5.

July 5. Gosport. — *Erection of a new school* in Clarence Square, Gosport, to accommodate 330 boys. Plans and specifications may be seen at the offices of the architect, H. Frost, surveyor to the District Council, Gosport, and quantities and forms of tender obtained on payment of a deposit of £5. Sealed tenders, endorsed "Clarence Square School," should be delivered to George R. Walker, secty., Education Offices, High Street, Gosport, not later than noon on July 5.

July 5. St. Keverne.—*Erection and completion of proposed residence* at St. Keverne, for Dr. E. Leverton-Spry, according to plans and specification, which may be seen by appointment at the proprietor's residence or at the office of Sampson Hill, architect, Green Lane, Redruth, from whom all particulars relating to the work may be obtained. Sealed endorsed tenders are to be sent to the proprietor, St. Kevern, R.S.O., on or before July 5.

July 5. Devonport.—*Erection of* a new administrative building at the Infectious Diseases Hospital, near North Prospect. Plans, specifications and conditions may be seen and forms of tender and quantities obtained on application to the Borough Surveyor, 29, Ker Street, Devonport, to whom tenders must be delivered, properly endorsed, on or before 10 a.m. on July 5. The sum of £1 1s. will be required as a deposit, which amount will be returned on receipt of a *bona-fide* tender.

July 6. Dublin.—*Erection of* vestry and heating arrangements to mortuary chapel in Deans Grange Cemetery. Plans and specifications can be seen at the Cemetery (Registrar's Office) during office hours, 8.30 till 4 o'clock. Tenders to be delivered at Deans Grange Cemetery on or before July 6.

July 6. Newton Abbot.—*Erection of a six-stall stable* at Newton Abbot, for the Great Western Railway Co. Plans and specification may be seen and forms of tender and bills of quantities obtained at the office of the Engineer at Plymouth Station, between 10 and 4. Tenders, addressed to G. K. Mills, secty., Paddington Station, London, and marked outside, "Tender for Stable, Newton Abbot," will be received on or before July 3.

July 7. Stafford.—*Alterations and improvements to Stretton Council School*, near Burton. Builders desiring to tender for the work should apply to Graham Balfour, Director of Education. Quantities will be supplied, for which a deposit of £1 1s. will be charged. The drawings and specification can be seen at the offices of the Education Committee at Stafford.

July 7. Eccles.—*Erection of the Carnegie Public Library* in Church Street. A copy of the bill of quantities, general conditions and form of tender may be obtained at the Town Clerk's Offices on depositing the sum of £2 2s. The plans may be inspected and further particulars obtained at the office of the architects, Potts, Son & Hennings, 34, Victoria Buildings, Victoria Street, Manchester. Tenders, endorsed "Tender for Carnegie Library," to be delivered to Edwin Parkes, town clerk, Town Hall, Eccles, not later than noon on July 7.

July 7. Truro.—*Alterations and additions* to the Bella Vista College, Truro, according to plans and specifications which may be seen at the County Education Office, Truro, or by appointment at the office of Sampson Hill, architect to the Committee, Green Lane, Redruth, from whom all particulars relating to the work may be obtained. Sealed endorsed tenders, on official forms, which may be had from the Secretary or the Architect, are to be sent to F. R. Pascoe, secty., Education Office, Truro, on or before July 7. The alterations to the building are to be completed before September 29 next.

July 7. Eastwood.—*Erection of a new school* at Eastwood, near Southend-on-Sea, to accommodate 160 children, and also for certain alterations and additions to the existing school. Contractors desirous of tendering are required to communicate with S. I. Adams, M R.S.I., architect and surveyor, Weston Chambers, Weston Road, Southend-on-Sea, not later than noon on June 21, enclosing cheque for £2 2s. Plans and specification may be seen at the offices of the Architect between 10 a.m. and 4 p.m. (Saturdays 10 a.m. to 12 noon) after June 30. Tender, sealed and endorsed "Tender for Eastwood School," are to be sent to J. F. Ingram, secty., Bank Chambers, Weston Road, Southend-on-Sea, by 10 a.m. on July 7.

July 7. Cwmduad. — *Renovation* of Cwmduad Baptist Chapel, in the parish of Conwil. Plans and specifications may be seen at Cilarddu, Conwil. Tenders, sealed and endorsed, to be sent to the Secretary, Baptist Chapel, Cwmduad, on or before July 7.

July 7. Swansea. — *Conversion* of Old Bethany Chapel, Edward Street, Swansea, into a warehouse. Plans and specifications may be seen and quantities obtained at the offices of the architect, Charles T. Ruthen, Bank Chambers, Heathfield Street, Swansea, upon payment of £1 1s. Tenders to be sent, addressed to Spillers & Bakers, Ltd., millers, Cardiff (Engineering Department), endorsed "Tender for Warehouse, Swansea," on or before July 7.

July 7. Old Trafford.—*Work and materials* required in the erection of a caretaker's house at the Council Offices, Old Trafford, for the Stratford U.D.C. The work is an instalment of a larger scheme of office extension ; and the drawings may be seen and specification, with schedule of quantities and form of tender, obtained on application to Ernest Worrall, the Council's surveyor, any day during office hours on payment of a deposit by cheque of £2 2s. Sealed tenders, on the form supplied, endorsed "Caretakers' House," and addressed to the Chairman, are due at the Council Offices by July 7.

July 7. Killay. -*New schoolroom* in connection with Siloam Baptist Chapel. Plans and specifications can be seen and all particulars obtained of Charles S. Thomas, architect and surveyor, Wind Street, Swansea. Sealed and endorsed tenders to be sent to Evan Williams, Goitre Fawr, Killay, on or before July 7.

July 7. Llanfihangel-y-Creuddin.—*Alterations, repairs and erection of boundary walling, gates, &c.*, at the school. Plan and specification, or copies of the same, can be seen at the school building in charge of the headmaster or at the office of G. Dickens-Lewis, M.S.A., county architect, 12, Terrace Road, Aberystwyth. Tenders, sealed and endorsed "Llanfihangel y-Creuddin School Estimate," are to be delivered not later than midday on July 7 at the office of R. J. Roberts, District Education Committee, Cambrian Chambers, Aberystwyth.

July 7. Cofadail.—*Alterations, additions and repairs* to the school and master's house adjoining. Plans and specification, or copies of the same, can be seen at the school building in charge of the headmaster, or at the office of G. Dickens-Lewis, M.S.A., county architect, 12, Terrace Road, Aberystwyth. Tenders, sealed and endorsed "Cofadail School Estimate," are to be delivered not later than midday on July 7 at the office of R. J. Roberts, clerk to the District Education Committee, Cambrian Chambers, Aberystwyth.

July 7. Brynherbert.—*Alterations and repairs* to the school building. Plans and specification or copies of the same can be seen at the school building in charge of the headmistress, or at the office of G. Dickens-Lewis, M.S.A., county architect, 12, Terrace Road, Aberystwyth. Tenders, sealed and endorsed "Brynherbert School Estimate," are to be delivered not later than midday on July 7 at the office of R. J. Roberts, clerk to the District Education Committee, Cambrian Chambers, Aberystwyth.

July 7. Cardigan.—*Alterations* to the offices and drains and the fixing of automatic flushing latrines at the school. Plan and specification, or copies of the same, can be seen at the school building in charge of the headmaster, or at the office of G. Dickens-Lewis, M.S.A., county architect, 12, Terrace Road, Aberystwyth. Tenders, sealed and endorsed "Cardigan School Estimate," are to be delivered not later than midday on July 7 at the office of Ivor Evans clerk to the District Education Committee, Cardigan.

July 7. Donacloney.—*Erection of* new manse. Plans and specifications may be seen at the office of W. W. Larmor, architect, Banbridge, or Howard Lyttle, Ballymenally, Donacloney. Tenders to be sent to Howard Lyttle, Donacloney, on or before July 7.

July 7. Bangour.—*Construction of* a timber meat larder at Bangour Village Asylum. Schedules may be obtained on application to the architect, Hippolyte J. Blanc, R.S.A., 25, Rutland Square, Edinburgh, where the drawings, specification and general conditions of contract will be exhibited. Schedules to be priced and extended and lodged with James Kyd, clerk and treasurer, Edinburgh District Lunacy Board, Castle Terrace, Edinburgh, not later than July 7.

July 9. Edinburgh.—*Brick, joiner, plumber and slater work* for the erection of new firewood factory buildings, Craigleith Poorhouse, Comely Bank, Edinburgh, for the Parish Council. The plans can be seen and schedules of quantities obtained on application to R. M. Cameron, architect to the Council, 53, Great King Street, Edinburgh. Sealed tenders are requested to be addressed, delivered and endorsed, to the Clerk, Parish Council Offices, Castle Terrace, not later than 10 a.m. on July 9.

July 9. Newark.—*Alterations and additions* at the Union Infirmary, Bowbridge Road, Newark, for the Guardians. Persons desirous of tendering for the alterations and additions thereto are requested to forward their names and addresses and a cheque for £2 2s. as a deposit to A. J. Franks, clerk to the board, Union Offices, Newark, on receipt of which form of tender and bills of quantities will be forwarded. Plans and specifications may be inspected at the office of the architect, Arthur Marshall, A.R.I.B.A., King Street, Nottingham. The deposit will be returned upon receipt of a bona fide tender upon the form to be supplied. Sealed tenders endorsed "Alterations at Infirmary," must be sent in to the Clerk not later than July 9.

July 9. Birmingham.—*Reconstruction of a portion of the tramway depot* in Kyott's Lake Road. Applications for forms of tender and bills of quantities may be made on or before June 28, at the office of the quantity surveyor, Anthony Rowse, King's Court, Colmore Row, Birmingham. Before obtaining the bills of quantities, it will be necessary to deposit a sum of £3 3s. for which a receipt will be given. The drawings may be seen on and after the same date at the office of the architect, Frank Barlow Osborn, F.R.I.B.A., 13, Bennett's Hill, Birmingham. Fair wages clause. Tenders must be delivered not later than noon on July 9 in sealed envelopes, addressed to the Chairman of the Tramways Committee, Council House, Birmingham, endorsed "Tender for Tramway Depot."

July 9. Limerick.—*Erection of twelve farmhouses* at Mount Shannon, near Limerick for the Irish Estate Commissioners. Plans and specifications can be obtained from the secty., Estates Commissioners, on receipt of £1. Tenders should be enclosed in a sealed envelope, marked "Tender" in left hand corner, and addressed to The Secty., Estates Commissioners, 26, Upper Merrion Street, Dublin. The latest date for the receipt of tenders will be noon on July 9.

July 9. Hastings.—*Alterations and additions to the existing grammar school buildings* and for the erection of a workshop. Plans and specification may be seen and quantities obtained at the offices of the architects, A. W. Jeffery & Son, 5, Havelock Road, Hastings, on payment of a fee of £1 1s. Sealed tenders, endorsed "Grammar School Tender," to be addressed to "The Clerk, Education Committee," 18, Wellington Square, Hastings, not later than noon on July 9.

July 9. Southampton.—*Works* of external and internal repairs, gravelling, lavatory accommodation, rebuilding, lighting, ventilation and new offices to Grately School. Tenderers may see plans and conditions of contract, and obtain specification at the office of W. J. Taylor, county surveyor, The Castle, Winchester. Plans and conditions of contract may also be seen at the school. A deposit of £1 1s. will be required for a copy of the specication. Deposits must be made by cheque payable to Hants County Council, and crossed Bank of England, or particulars will not be sent. Tenders, endorsed "Proposed work, Grately Council Schools." are to be delivered to H. Barber, clerk to the County Council, The Castle, Winchester, on or before July 9.

July 9. Penarth.—*Private street improvement works* in Harbour View Road and Lane, Salisbury Avenue Lane, and Clinton Lane, for the U.D.C. Plans and specification may be seen and bills of quantities obtained from Edgar J. Evans, A.M.I.C.E., surveyor, Council Offices, Penarth. Sealed tenders, endorsed "Tender for Street Works," must be delivered not later than noon on July 9.

July 9. Kiffig.—*Repairing the tower and interior* of Kiffig Church, near Whitland. Plans and specification to be seen with D. Raymond, Waun Farm, Kiffig, Whitland. Endorsed tenders to be sent in not later than July 9.

July 10. Pontgarreg.—*Alterations and repairs* to the school. Plan and specification or copies of the same can be seen at the school building in charge of the headmaster, or at the office of G. Dickens-Lewis, M.S.A., county architect, 12, Terrace Road, Aberystwyth. Tenders, sealed and endorsed "Pontgarreg School Estimate," are to be delivered not later than midday on July 10 at the office of T. Thomas, clerk to the District Education Committee, Llandyssul.

July 10. Pontshan.—*Repairs and the erection of a new classroom and cloakrooms* at the school. Plan and specification or copies of the same can be seen at the school building in charge of the headmaster, or at the office of G. Dickens Lewis, M.S.A., county architect, 12, Terrace Road, Aberystwyth. Tenders, sealed and endorsed "Pontshan School Estimate," are to be delivered not later than midday on July 10 at the office of T. Thomas, clerk to the District Education Committee, Llandyssul.

July 10. Exeter.—*Alterations and additions* to Nos. 4 and 8, Higher Summerlands, Exeter, for the Guardians. Plans and specifications may be seen, and bills and quantities, together with form of tender, obtained at the offices of the architect and surveyor to the Guardians, R. M. Challice, 14, Bedford Circus, Exeter, upon payment of £1 1s. Sealed and endorsed tenders on the above form must be sent to Arthur Snell, clerk, New Buildings, Castle Street, Exeter, on or before July 10.

July 10. Isle of Wight.—*Repairs* to the Havenstreet School. Plans and specifications may be seen at the County Education Offices, Newport, I.W., or at the offices of the County Surveyor, St. Thomas's Street, Ryde, I.W. Sealed tenders, endorsed "Havenstreet School," should reach F. G. Flux, secty., County Educational Offices, Newport, I.W. not later than July 10.

July 10. Croydon.—*Erection of a school* for 1,200 children, proposed to be built in Davison Road, Croydon, in accordance with the drawings prepared by H. Carter, Pegg, F.R.I.B.A., of Thornton Heath. Bills of quantities and forms of tender can be obtained at the Committee's Office, upon payment of £1 1s. Applications should reach James Smyth, clerk to the Committee, Education Office, Katharine Street, Croydon, not later than June 20, and tenders must be delivered not later than noon on July 10, Tenders will only be received subject to the plans, specification and the terms of the draft contract, which will be deposited at the Committee's office and may be inspected during office hours.

July 10. London, S.W.—*Erection of two public elementary schools*, one to accommodate 836 children on the Lawn Lane site, South Lambeth Road, S.W., and the other to accommodate 804 children on the Franciscan Road site, Tooting Graveney, S.W., for the L.C.C. Persons desiring to submit tenders may inspect the drawings and specification and obtain the bills of quantities, forms of tender, and other particulars, at the Education Offices (Architect's Department), Victoria Embankment, W.C., upon payment to the Cashier of the sum of £5 in each case. Fair wages clause. Each tender must be enclosed in the envelope provided and delivered at the Education Offices, Victoria Embankment, W.C. (Room No. 119), not later than 11 a.m. on July 10, after which hour no tender will be received. Any tender which does not comply with the printed instructions for tender may be rejected.

July 10. Trewen.—*Improvements and repairs* to the school building. Plan and specification, or copies of same, can be seen at the school building in charge of the headmaster, or at the office of G. Dickens-Lewis, M.S.A., 12, Terrace Road, Aberystwyth. Tenders, sealed and endorsed "Trewen School Repairs," are to be delivered not later than midday on July 10 at the office of T. Thomas, clerk to the District Education Committee, Llandyssul.

July 11. Glamorgan.—*Erection* of (1) new mixed and infants' school at Kingsbridge, Gorseinon, near Swansea; (2) new offices and heating chamber, and converting existing privies into waterclosets, laying drains, &c., at Panteg Council School, near Ystalyfera; (3) building new cloak-rooms and heating chamber, and various alterations at Dunvant Council School, near Swansea; (4) building a new heating chamber at Gendros Infants' School, Swansea; (5) heating the following Council schools with low-pressure hot-water system:—Port Talbot Central, Panteg, Gendros (infants'), Coedfranc (girls), Glais (near Clydach), Tynewydd (Ogmore Vale and Miskin Village; (6) cleaning and painting various Council schools. Plans or documents for all the works may also be seen or obtained from T. Mansel Franklen, clerk of the Glamorgan County Council, Glamorgan County Offices, Westgate Street, Cardiff, to whom tenders must be delivered by July 11.

July 11. London, S.W.—*Alterations* in connection with two wards at the South-Western Fever Hospital, Landor Road, Stockwell S.W., for the Metropolitan Asylums Board. A copy of the specification, conditions of contract, bills of quantities, and form of tender can be obtained at the Office of the Board, Embankment, E.C., on payment of a deposit of £1. The drawings can be seen by intending contractors at the office of T. W. Aldwinkle & Son, architects, 20, Denman Street, London Bridge, S,E., on production of the specification or form of tender. Tenders, endorsed in accordance with the instructions on the form of tender, must be delivered at the Office of the Board by 10 a.m. on July 11.

July 11. Wolverhampton.—*Structural alterations* at two manual instruction centres and the erection of new centres at the rear of the Higher Grade School, New Hampton Road, Wolverhampton. Particulars and conditions may be obtained on application to T. H. Fleeming, architect to the Education Committee, 10, Queen Square, Wolverhampton. Tenders, addressed to "The Chairman, Sites Buildings and General Purposes Sub-Committee, Education Offices, Town Hall, Wolverhampton," must be received not later than noon on July 11. A deposit of £1 1s. must be forwarded with the application for bills of quantities and form of tender for which a receipt will be given. Fair wages clauses.

July 11. Newcastle-on-Tyne.—*Remodelling and extending* the Mason Dinnington (Mixed) Council School, situate near Newcastle-on-Tyne, also for the erection of a new infant Council school to accommodate 150 scholars, to be erected immediately adjoining the existing mixed school buildings, for the County Council Education Committee. Contractors will be required to tender for both works, and those desirous of tendering should forward their name and address to the undersigned not later than June 28, together with a deposit of £2 2s. Plans of both works may be inspected at the Committee's offices, and sealed tenders, endorsed "Tenders for Dinnington New School and Improvements," must be forwarded to C. Williams, secretary to the Education Committee, Pearl Buildings, Newcastle-on-Tyne, not later than 10 a.m. on July 11.

July 12. London, S.E.—*Repointing and external painting* at Melvin Road School, Penge, S.E. The specification may be seen and forms of tender obtained on payment of £1 1s. at the offices of the surveyor to the Committee, H. W. Longdin, Town Hall, Anerley, S.E. Sealed tenders, endorsed "Tender for Repointing ar Painting Melvin Road School," to be sent to C. Gordon Liddle, clerk to the Committee, the Court House, Anerley, S.E., by noon on July 12.

July 12. Wareham.—*Repairs and alterations* at the Workhouse. Specifications and particulars can be seen at the offices of W. W. Fookes, architect and surveyor, Wareham. Sealed tenders, endorsed "Tenders for Workhouse Repairs," to be sent to E. S. Clark, clerk, Union Offices, Wareham, not later than 10 a.m. on July 12.

July 12. Llanerchymedd.—*Additions and alterations* to the Council school, together with new infants' school, out-offices, boundary walls, &c. Plans and specifications may be inspected at the Llanerchymedd Council School, and at the office of J. Owen, F.R.I.B A., county architect, Menai Bridge. Tenders, endorsed "Llanerchymedd School," (on forms which will be supplied by the Architect), to be delivered to R. H. Williams, secretary of education, Education Offices, Llangefni, not later than 10 a.m. on July 12.

July 12. Dewsbury.—*Erection of a new head post-office* at Dewsbury. Drawings, specification and a copy of the conditions and form of contract may be seen on application to the Postmaster between 10 a.m. and 5 p.m. Bills of quantities and forms of tender may be obtained at the Office of Works on payment of £1 1s. Tenders must be delivered before noon on July 12, addressed to the Secretary, H.M. Office of Works, &c., Storey's Gate, London, S.W., and endorsed "Tender for Dewsbury Post-office."

July 13. Norwich.—*Enlargement* of Great Dunham School. Builders desirous of tendering should send in their names to the Secretary, Norfolk Education Committee, 57, London Street, Norwich, at which office plans and specifications can be inspected and bills of quantities obtained on and after July 6. A deposit of £1 1s. will be required. Tenders must be delivered by noon on July 13, addressed to "The Secretary," at the above address, and endorsed "Tender for Great Dunham School."

July 13. New Mills.—*Erection of a new boardroom* at the Workhouse, New Mills. Bills of quantities can be obtained, and plans and specifications inspected at the office of A. Walker, clerk to the Guardians of the Hayfield Union, Spring Bank, New Mills, to whom tenders must be delivered by July 13.

July 14. Manchester.—*Erection of* a manager's house at the Withington Sewage Works, Chorlton-cum-Hardy. Drawings may be inspected and bills of quantities and tender forms may be obtained on application to the Secretary of the Rivers Department, Town Hall, Manchester. Tenders must be enclosed in the official envelope provided expressly for the purpose (otherwise the tender will not be considered), and delivered at the above office not later than 10 a.m. on July 14.

July 14. Blackpool.—*For the whole of the work in the erection of a lecture-hall* at Claremont Congregational Church, Blackpool; also separate tenders for the various trades. Bills of quantities and other particulars may be obtained and plans inspected at the offices of the joint architects, Walter Wade, Bank Chambers, St. Anne s-on-Sea, and William Fielding, 12, Birley Street, Blackpool. Tenders, sealed, and endorsed "Tender for New Lecture Hall," must be addressed to the chairman, Rev. A. H. Boyden, B.A., B.Sc., 22, Clevedon Road, Blackpool, and delivered not later than July 14.

July 16. London, W.—*Erection of* new school, Drayton Green, West Ealing. The drawings and specification may be seen, and forms of tender, together with bills of quantities and other particulars, may be obtained from Charles Jones, M.I.C.E,, borough engineer, Town Hall, Ealing, W., any day during office hours, upon payment of a deposit of £5 5s. Sealed tenders, in the envelopes provided, endorsed "Tender for New School, Drayton Green," must be delivered at the office of J. B. Johnson, secty., Education Office, Town Hall, Ealing, W., not later than noon on July 16.

July 16. Beckenham.—*Erection of* extensions to and the modernization of the existing boys', girls' and infants' departments of the public elementary schools, Bromley Road, Beckenham, for the U.D.C. Drawings may be seen and bills of quantities, and forms of tender obtained on application to John A. Angell, surveyor, on the production of a receipt from the collector (who attends his office daily from 9 to 10 only, except on Tuesdays, when his hours are from 9 to 1) for a deposit of £5. Fair wages clause. Tenders, duly sealed and endorsed "Tenders for Bromley Road Schools," to reach F. Stevens, clerk of the Council, Beckenham, not later than 4 p.m. on July 16.

July 16. Cleckheaton.—*Four-storey mill and offices* at Prospect Mill, Cleckheaton, for Critchley, Sharp & Tetlow, Ltd. Plans may be seen and bills of quantities obtained at the offices of Howorth & Howorth, architects, Old Bank Chambers, Cleckheaton. Sealed and endorsed tenders to be sent to the office of the architects not later than noon on July 16.

July 16. London, W.—*Erection of* new school, Drayton Green, West Ealing. The drawings and specification may be seen and forms of tender, together with bill of quantities and other particulars, may be obtained from Charles Jones, M.I.C.E., borough engineer, Town Hall, Ealing, W., any day during office hours, upon payment of a deposit of £5 5s. Sealed tenders, in the envelopes provided, endorsed "Tender for New School, Drayton Green," must be delivered at the office of J. B. Johnson, secty., Education Office, Town Hall, Ealing, W., not later than noon on July 16.

July 16. Brithdir.—*Construction of roads and surface-water drains and the erection of ninety-nine* (*or less*) *houses*, in four blocks, at Brithdir, for the Cefn Brithdir Building Co., Ltd. Drawings and specification and bill of quantities of the roads, may be obtained at the offices of J. Llewellyn Smith, architect and surveyor, Merthyr and Aberdare. Sealed endorsed tenders to be sent to the secretary, H. Seymour Berry, 30, Victoria Street, Merthyr Tydfil, on or before 4 p.m. on July 16.

July 17. Rochester.—*Pulling down and removal* of certain houses in High Street, Strood Intra. Particulars and conditions of contract and form of tender can be obtained of William Banks, A.M.I.C.E., city surveyor, Rochester. Tenders are to be delivered at the Town Clerk's Office before 4 p.m. on July 17.

July 17. Edmonton.—*Alterations and additions* to the Brettenham Road School, together with the annual cleansing and repairs at their Brettenham Road and Croyland Road Schools. Persons desirous of tendering should send their names to the architect, Henry W. Dobb, Town Hall, Lower Edmonton, on or before Monday, July 2, when specifications, plans and form of tender will be forwarded. Fair wages clause. Tenders must be delivered to John Moule, secty., Education Offices, Brettenham Road, Upper Edmonton, on or before noon on July 17.

July 17. Llancadle.—*Re-seating, &c.*, Penmark Calvinistic Methodist Chapel, for the trustees. Plans and specifications may be seen with the Rev. D. Wynne Rees, Llancadle. Sealed and endorsed tenders to be sent to the Rev. D. Wynne Rees, The Manse, Llancadle, near Cardiff, on or before 5 p.m. on July 17.

July 17. Llancadle.—*Re-seating, &c.*, St. Athan Calvinistic Methodist Chapel, for the trustees. Plans and specifications may be seen with the Rev. D. Wynne Rees, Llancadle. Sealed and endorsed tenders to be delivered to the Rev. D Wynne Rees, The Manse, Llancadle, near Cardiff, on or before 5 p.m. on July 17.

July 19. Cultra.—*Erection of* a dwelling-house near Cultra Railway Station. Plans and specification may be seen and copies of the bill of quantities obtained at the office of Graeme-Watt & Tulloch, architects, 77A, Victoria Street, Belfast, on payment of a deposit of £1 1s., which will be returned to those contractors who submit a *bona-fide* tender. Sealed and endorsed tenders to be delivered at the above office not later than 10 a.m. on July 19.

July 24. Douglas (Isle of Man).—*Alterations and additions* to the Tynwald Street Schools (Girls Department). For plans and specifications apply to G. & W. R. Kay, architects, Athol Street, Douglas. Fair wages clause. Full particulars as to the time of the commencement and completion of the work and conditions upon which tenders will be received may be had from the Clerk of the School Board or the Architects. Sealed tenders, endorsed "Tenders for Alterations to Tynwald Street School," to be delivered at the Office of the Board on or before July 24.

July 25. Honiton.—*Taking down and removal* of the old brick arch and parapets, re-building the present abutments to a new line, and supplying and fixing an iron bridge. The plans, specification and form of contract can be seen at the office of the County Council at the Castle of Exeter, where tenders are to be sent on or before July 25.

July 25. Birmingham.—*Erection of six homes for epileptics and other works* on the Monyhull Hall Estate, near King's Heath, Birmingham, according to plans and specifications prepared by C. Whitwell and Son, architects to the Joint Committee. Builders desirous of tendering must apply to R. J. Curtis, clerk to the Joint Committee, Guildhall Buildings, Birmingham, in writing, and deposit the sum of £25 on or before June 30. Bills of quantities will then be forwarded, together with instructions as to the inspection of plans and drawings. The amount of the deposit will be returned by the Joint Committee's cheque to those who deliver a bona fide tender to me on or before July 25. No tender will be definitely accepted until the Local Government Board has finally approved the plans and estimates.

July 26. London, N.E.—*Erection of a central library building* in Mare Street, Hackney. Plans and specifications may be seen and bills of quantities, with conditions, form of tender and form of contract may be obtained at the offices of the architect, H. A. Crouch, A.R.I.B.A., 12, Gray's Inn Square, W.C., on and after July 6, on payment of £1 1s. Tenders, sealed and endorsed "Tenders for Central Library Buildings," to be deposited with W. A. Williams, town clerk, Town Hall, Hackney, not later than 5 p.m on July 26.

August 16. Antwerp.—*Reconstruction of* the Government Bonded Warehouses, known as the "Nord-Ancien and Nord-Nouveau." The specification ("*Cahier des charges*," No. 1,144) relating to the contract may be obtained from the Hôtel de Ville, Antwerp, at a cost of 2 francs. All tenders should be sent in sealed registered envelopes, addressed "A Monsieur le Bourgmestre en l'Hôtel-de-Ville d'Anvers," and should reach the Hôtel de Ville not later than August 16. A deposit of £1,000 is required to qualify any tender. A copy of the specification may be seen at the offices of the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street London, E.C.

No date. Starnthwaite.—*Erection of* a laundry a the Training Home for Epileptic Children. Plans and specifications can be seen and other information obtained by applying at the offices of John Stalker, M.S.A., architect, Kendal.

No date. Hyde.—*Alterations* to galleries, &c., and new rostrum, for the Wesleyan Chapel, Norfolk Street, Hyde. Plans and specifications can be seen and quantities obtained on receipt of half-a-guinea (which amount will be returned when *bona-fide* tender is received) to Joseph Lindley, architect and surveyor, Town Hall Chambers, Hyde.

No date. Shenfield.—*Erection of a pair of cottages* adjoining the "Eagle and Child" at Shenfield, Essex. To inspect plans, &c., apply to R. Burgess, Red House, Shenfield.

THE RESULT OF MERIT.

JAPONIKA

THE PERFECTED ENAMEL PAINT,

Has succeeded in a remarkable manner. Architects are now specifying it, discriminating decorators who have used it are unanimous in their agreement with us that:

1. It is cheaper than any first-class enamel obtainable.
2. It is not excelled in quality by the highest price enamel on the market.
3. The excellent spreading power possessed by **Japonika** (1 gallon will cover 70 to 90 square yards) renders it a very cheap material apart from its cost per gallon.

To DECORATORS.

You will doubtless be called upon during the coming season to carry out many jobs in which enamel will be required. Make yourself acquainted with the merits of **JAPONIKA now. Its use will enable you to maintain your reputation for high-class work, and at the same time save money.**

We shall at all times be pleased to correspond with decorators, and to give our advice as to special treatment which may be necessary when **Japonika** is used.

HALL'S SANITARY WASHABLE DISTEMPER

The Modern Wall Covering.

The most popular wall covering of to-day is Hall's Sanitary Washable Distemper. It works easily, sets hard and dries with a uniform surface, equal to flatted oil paint.

It is made in 73 colours, including rich dark as well as light shades.

One cwt. of Hall's Distemper mixed with water to the consistency of cream, will cover double the surface of one cwt. of pure White Lead Paint and save 40 per cent. of the cost of labour.

"**Sisco" White Japan** is the correct material for painting Doors, Picture Rails, and all Woodwork of rooms decorated with Hall's Distemper. "Sisco" Japan is a pure white decorators' enamel, which dries with a hard, smooth lustrous surface. It lasts for many years with beauty unimpaired.

Samples and full particulars on application to
SISSONS BROTHERS & Co., Ltd.,
HULL,
Manufacturers of Colours, Varnishes, Paints and all materials for Decorators' use.

CONTRACT LIST (*continued from p.* 13).

ENGINEERING.

July 6. Wallasey.—*Extension of refuse destructor* (not buildings), for the U.D.C., the specification of which and further particulars may be obtained on application to W. H. Travers, engineer and surveyor, Public Offices, Egremont, Cheshire. A charge of £3 will be made. Tenders, enclosed in sealed envelopes, endorsed "Tender—Refuse Destructor," and addressed to H. W. Cook, clerk and solicitor, Public Offices, Egremont, Cheshire, to be forwarded per post not later than July 6.

July 6. Warwick.—*Construction of covered service reservoir* (capacity about 500,000 gallons), and the provision, laying and jointing of about 500 yds. of 12in. and 8in. cast-iron pipes, together with all special castings and valves required; also for the erection of engine-house and gas-producer house, and other works in connection therewith, in accordance with the plans, sections, detail drawings and specification prepared by the Engineers. Plans and specification may be seen and form of tender and bills of quantities obtained at the offices of the engineers, Wilcox & Raikes, 63, Temple Row, Birmingham, on payment of a deposit of £3 3s. The tenders must be sent in under seal in envelopes supplied, endorsed "Warwick Water Supply, Contract No. 4," to Brabazon Campbell, town clerk, Warwick, not later than noon on July 6.

July 7. Teignmouth.—*Laying and jointing of about* 17,110 *lineal yds. of 9in., about* 1,120 *lineal yds. of 6in., and about* 5,850 *lineal yds. of 4in. British Mannesman steel pipes*, including haulage of pipes from various railway stations (a separate contract having been entered into for the supply of the pipes), together with the erection of a meter-house and the provision of all necessary sluice, air and other valves, washouts, meters, chambers and incidental works, including the crossing of the tidal river Teign, about one-fourth of a mile in width. Plans may be seen and copies of the general conditions, specification, bills of quantities and form of tender obtained on application at the office of C. F. Gettings, engineer, Town Hall, Teignmouth, on payment of a deposit of £5. Sealed tenders, upon the form supplied, addressed to A. Percival Dell, clerk to the Council, Town Hall, Teignmouth, Devon, and endorsed "Teignmouth Water Scheme, Contract No. 2," must be delivered on or before July 7. Fair wages clause.

July 9. New Zealand.—*Tunnel.* Alternative tenders will be received at the Office of the High Commissioner for New Zealand, Westminster Chambers, 13, Victoria Street, London, S.W., for the construction of a tunnel 5 miles 24½ chains in length at Arthur's Pass, through the dividing range between Canterbury and Westland, on the route of the New Zealand Midland Railway. They are to be addressed to the High Commissioner for New Zelaand, 13, Victoria Street, Westminster, S.W., and marked on the outside "Tender for Arthur's Pass Tunnel—60 months" (or "48 months"). Tenders will be received up till noon on July 9. Specifications, conditions, tender forms and other information may be obtained on application to the High Commissioner upon payment of a deposit of £10. Plans can also be inspected at the High Commissioner's Office.

July 9. Dublin.—*Electric works* at the Royal Irish Academy House, Dawson Street, and at the Science and Art Buildings, and Leinster House, Kildare Street, Dublin. The plans and specification can be seen at the Office of Public Works, where also forms of tender may be obtained. The envelope containing the tenders must be endorsed; and tenders must be sent in to the Office of Public Works not later than 10 a.m. on July 9.

July 9. Dublin.—*Supply of sub-station switchboards and accessories, transformer pillars.* Specifications, with general conditions and form of tender, can be obtained from the City Electrical Engineer, Fleet Street, Dublin, on payment of £1 1s, for each specification. Tenders, addressed "Chairman of the Lighting Committee, 3, Cork Hill, Dublin," and marked "Tender for Sub-Station Switchboards, Transformer Pillars, &c.," to be delivered not later than July 9.

July 10. London, W.C.—*Laying of* about 3,000 yds. of water-main from Plumstead Common to Woolwich Common Reservoir, in the Kent District, for the Metropolitan Water Board. Forms of tender, with schedule and conditions of contract, may be obtained on application to the District Engineer at the Board's Offices, Bookmill Road, Deptford, S.E. Such application must be made between 10 and 4 (except on Saturdays). Tenders, enclosed in sealed envelopes addressed to the Clerk of the Board, and endorsed "Tender for Pipelaying, Kent District," must be delivered at the Offices of the Board not later than 10 a.m. on July 10.

July 11. London, S.W.—*Work and materials* required in the construction of the permanent way (for electric traction), bridge work, road widenings, &c., for Contract No. 17, for the Middlesex County Council. Railway No. 1 (Order 1903). A line of double track (with crossovers, contingent works, &c.) to be laid along Green Lanes, in the districts of Wood Green and Southgate, in the county of Middlesex, to a length of 3 miles 0 furlongs, 4 chains, or thereabouts. The plans, conditions of contract, specification of works, &c., for this contract may be seen and schedule of quantities obtained by intending contractors, on payment of £10, on application to H. T. Wakelam, M.I.C.E., county engineer, Middlesex Guildhall, Westminster, S.W. Tenders, properly sealed and endorsed "Tender for Light Railway No. 1," to be delivered to Sir Richard Nicholson, clerk of the County Council, Middlesex Guildhall, Westminster, S.W., not later than noon on July 11.

July 12. Ciney (Belgium).—*Installation of new pumping apparatus* for the water-supply works. Particulars may be obtained from the Secretariat Communal, Ciney Namu. Tenders to be sent in by July 12.

July 12. Bolton.—*Supply, delivery and erection of condensing apparatus.* Specification and form of tender may be had on application to Arthur A. Day, A.M.I.C.E., M.I.E.E., borough electrical engineer and tramways general manager, Spa Road, Bolton. Tenders, endorsed "Condensing Apparatus," to be addressed to the Chairman of the Electricity Committee, Town Clerk's Office, Town Hall, Bolton, and must be delivered not later than noon on July 12.

July 14. Madrid.—*Erection of a cement or "biton" bridge* over the Ebro River at Saragossa. For particulars apply to Direccion General de Obras Publicas, Madrid. Tenders to be sent in by July 14.

July 16. Wallasey.—*Supply and delivery of alternating current transformers* required during the next two years, for the U.D,C. Copies of the specification may by obtained on application to the engineer, J. A. Crowther, at his office, Seaview Road, Liscard. A charge of £1 1s. will be made for each copy of the specification. Sealed tenders on the form provided for the purpose, endorsed "Tender for Transformers," to be delivered to H. W. Cook, clerk and solicitor, Public Offices, Egremont, Cheshire, on or before July 16.

July 17. Birmingham.—*Widening* the Viaduct, &c., between Great Charles Street and Hockley Station, Birmingham, for the G.W.R. Plans and specification may be seen and forms of tender and bills of quantities obtained at the office of the New Works Engineer at Paddington Station, between 10 a.m. and 4 p.m. Tenders, addressed to G. K. Mills, secty., Paddington Station, London, and marked outside "Tender for Widening Viaduct, &c., Birmingham," will be received on or before July 17.

July 20. Leeds.—*Construction of* four filter beds, clear-water tank, meter house, the making of roads, laying of pipes and drains, &c., in connection therewith, at the site of the new filter beds, Otley Road, Headingley, Leeds. Plans may be seen and the specification, bill of quantities, and form of tender obtained at the office of C. G. Henzell, M.I.C.E., waterworks engineer, Municipal Buildings, Leeds, on payment of a deposit of £5. Tenders, endorsed "Tender for New Filter Beds, &c., at Headingley," must be addressed to the Chairman of the Waterworks Committee, and delivered in a sealed cover at the Town Clerk's Offices, Town Hall, Leeds, not later than 10 a.m. on July 20.

July 20. Birmingham.—*Construction of a covered filtered water reservoir and connections* at the Frankley Waterworks, Northfield, near Birmingham. The drawings may be seen and specifications and bills of quantities obtained at the offices, 44, Broad Street, Birmingham, on and after July 2, on the deposit of the sum of £5. The site at Frankley may be inspected by appointment from July 2 to July 6 inclusive. Early application for particulars is necessary, as only a limited number will be given out, and none after July 6. Fair wages clause. Sealed tenders, endorsed "Tender for Works at Frankley," are to be delivered to E. Antony Lees, secty., 44, Broad Street, Birmingham, at or before noon on July 20.

July 24. Thornaby.—*Renewal of the superstructure of the bridge* carrying the passenger lines over the River Tees near Thornaby, Stockton, and the construction and erection of new steel bridge of five spans, of a total length of about 340 feet, including about 360 tons of steel-work for the North-Eastern Railway. The contract will also include the removal and rebuilding of part of the piers in masonry. Plans may be seen, and specification, detailed quantities, and form of tender obtained on personal application at the office of W. J. Cudworth, the company's engineer, at York. Sealed tenders marked "Tenders for the renewal of Tees bridge, Thornaby" must be sent to the secty. at York, before noon on July 24.

July 26. Rhondda.—*Steelwork* of a road bridge of 52ft. span and 40ft. in width, erected complete (to contractor's own design) at Llwynypia, Rhondda Valley, for the U.D.C. Designs and tenders must be received not later than July 26. Plans and sections of the abutments and site and all particulars may be obtained on application to W. Jones, engineer and surveyor, Council Offices, Pentre, Rhondda, on deposit of £1 1s.

August 7. Lancaster.—*Reconstructing and improving the steam-heating arrangements and hot-water service* of the County Lunatic Asylum. The committee is prepared to consider tenders from engineers or firms who are willing to make a survey, free of cost to the committee, and to report on what improvement they would propose to make in the present system. Further information, if required, may be obtained on application to the medical superintendent. Tenders will be received up to the morning of August 7.

Aug. 31. Rio de Janeiro.—*Supply of* 34 *metallic superstructures* for bridges on the Central Railway. A deposit of 5,000 milreis is required. For particulars apply to Intendencia da Estrado de Ferro Central do Brazil, Rio de Janeiro. Tenders to be sent in by Aug. 31.

Oct. 1. Bangkok (Siam).—*Construction of a bridge*, 260 metres long, over the Meram River. For particulars apply to the Siamese State Railways, Bangkok. Tenders to be in by Oct. 1.

Oct. 1. Siam.—*Iron bridge* across the Menam River, Siam, for the Royal Siamese State Railways. Drawings and conditions may be obtained for a payment of 10s. from W. A. Evans, acting financial agent, Siamese Legation, 23, Ashburn Place, S.W. Sealed tenders must be forwarded to L. Weiler, Director-General, Railway Department, Bangkok, Siam, in whose office they will be publicly opened on Oct. 1.

IRON AND STEEL.

July 5. Gravesend.—*Supply and fixing of about* 110 *yds. of wrought-iron fencing.* Plans and specification may be seen at the Borough Surveyor's Office, Town Hall, and tenders, marked "Tender for Iron Fencing," must reach H. H. Brown, town clerk, not later than July 5.

PAINTING AND PLUMBING.

July 6. Manchester.—*Painting various bridges* over the Bridgewater and Rochdale canals and the River Medlock. Specification and form of tender may be obtained on application at the City Surveyor's Office, Town Hall, Manchester, on payment to the City Treasurer of £1 1s. FIRE SUPPLEMENT (MONTHLY).

MILAN FIRE CONGRESS.

WE have referred to the International Fire Service Congress of Milan in our previous issue, as we were able to obtain some particulars just before going to press.

The conference was, however, of such an important character that we must add further particulars. In the first place this conference was organized under the auspices of the International Fire Service Council, and at the invitation of the Italian Government and the Italian Fire Service Association. It had for its patron the King of Italy, and was opened on the King's behalf by H.R.H. the Prince of Turin. It had for its president and vice-presidents the Ministers of State, whose departments are interested in matters of fire-protection, and it had among its Congress members men of such eminence as Monsieur Lepine, the great Paris Police Chief, whilst practically everybody was present who could speak authoritatively on fire service and fire-preventive matters.

It is, however, curious to observe how gradually these conferences give greater attention to fire-preventive questions, and we find for instance that of nine resolutions passed, no less than four specifically dealt with questions of building construction, as against two which referred to fire-brigade questions proper and three that referred to general questions of fire protective organization. The architectural and engineering element is very much on the increase in the ield of fire-protection, and the modern fire-brigade officer seems to be generally either an architect, a surveyor, a civil engineer or a royal engineer by profession. The work of the modern fire-brigade officer is turning more and more in the direction of the supervision of buildings from the fire-preventive point of view, including a primary examination of plans and the inspection of the mechanical equipment. A thorough knowedge of building and building construction eems to be required, also a knowledge of electricity, mechanical engineering, and other echnical specialities.

On the other hand, architects and surveyors are practically being compelled to ake a greater interest in matters of fire-proection than heretofore, and upon approachng the subject of fire-resisting materials ind, as a rule, that the first thing they must do is to try and get rid of theoretical preconceived notions and to realize the latest esults of investigation with materials and he conditions of fire due to the highly nflammable nature and bulk of goods nowadays stacked in buildings. In other words, he teaching of ten years ago has to be nlearnt by the architect and engineer of to-day if he wishes to keep pace with modern evelopments in fire-resisting construction, nd there is no place where the ordinary ractitioner can more rapidly realize how ittle his older teachings apply than by ssociating with the specialist architect, the modern fire chief, and the modern fire-insurance surveyor whom he meets at conferences, such as the Milan Fire Congress.

The first step towards bringing together those interested in building construction, fire service and fire-insurance requirements was attained in 1903 by the British Fire-Prevention Committee when they convened the first Fire Prevention Congress as distinct from the Fire Service Congress. Since that date, both at Buda Pesth and at Milan, the fire congresses of old have practically become Fire Prevention Congresses.

Some of the principal papers at Milan dealt with the protection of windows, with questions appertaining to reinforced concrete, with means of escape from public buildings, with motor garages and other structural problems; and had it not been for two very good papers by the chief of the Vienna Fire Brigade and the chief of the Berlin Fire Brigade, both regarding motor fire appliances, the consideration of the constructional questions would have predominated to too great an extent.

We have published in one of our previous issues the paper by Mr. Ellis Marsland, district surveyor for Camberwell. In the current issue we give the paper by Mr. Percy Collins, F.S.S., on motor garages, one of the latest constructive problems.

In due course we shall present other papers.

In the meantime we would give publicity to some of the resolutions passed at this Congress that have reference to building construction, and we should at once mention that the resolution on reinforced concrete is probably one that will have the most far-reaching effect. How great the interest was in questions of reinforced concrete may be gathered from the fact that the paper read by Mr. James Sheppard, surveyor to the North British Insurance Co., was the best attended paper at the Congress, and probably the best received.

The resolutions are as follows:—

THE RESOLUTIONS.

Resolution I.—External openings to Buildings.

That the Congress considers—

(*a*) That greater attention be accorded to the protection of vertical external openings to buildings than heretofore.

(*b*) That some approved means of protection be compulsory for all opposite windows having less than 8ft. intervening, and for opposite windows in enclosed courts having less than 15ft. intervening.

Resolution II.—Public Buildings.

That the Congress considers that it is necessary to accord greater attention than heretofore to safety from fire in large public buildings, such as churches, museums, hospitals, colleges, &c.

Resolution III.—Reinforced Concrete.

(*a*) That the Congress considers that no reinforced concrete construction should be permissible in buildings intended to be fire-resisting unless the aggregate be most carefully selected and applied in such a manner as to give substantial protection to all metal parts.

That it is advisable where reinforced concrete is intended to be fire-resisting that every portion of the metal rods or bars contained therein be covered by not less that 2ins. of concrete, the aggregate of which must be able to pass through a sieve of not more than 1in. diameter, and that Portland cement of great fineness only be used.

(*b*) That where feasible all external angles should be rounded.

(*c*) Any angle iron needed for mechanical protection should be held in position independently of the concrete.

Resolution IV.—Motor Garages.

That the Congress considers—

(*a*) That the accommodation for motor-cars (motor garages) should not be allowed under dwellings.

(*b*) That special measures for isolating motor garages from adjacent dwellings be adopted.

(*c*) That special measures be taken to avoid the possible access of benzine or petrol into the cellarage, drains or sewerage system of buildings.

(*d*) That for the storage of small quantities of petrol or benzine the cans should be kept below ground level, but where a greater quantity be kept than can be easily removed by hand a proper underground metal receptacle should be employed from which the liquid could be extracted without the pressure of air.

Resolution V.—International relations and the International Fire Service Council.

That the Congress considers the primary object of the International Fire Service Council to be:—

I.—The encouragement of international social relations:—

(*a*) With the arrangements of facilities for written intercourse between the leaders of the fire-fighting and fire-preventing services of all countries.

(*b*) With the arrangements of the exchange of visits between fire-brigade officers and men of different countries.

II.—The organization of internal congress and congresses and conferences on important technical fire-preventive and fire-service subjects at given intervals:—

(*a*) With the arrangement of a proper sequence of the subjects to be considered without repetition.

(*b*) With the arrangement of their discussion by leading authorities.

(*c*) With their publication on uniform lines in three languages.

III.—The maintenance of a well managed enquiry office:—

(*a*) At which particulars as to sources of information can be easily and rapidly obtained.

(*b*) Technical questions can be replied to with authority

(*c*) Statistical and general information is issued at regular intervals.

Resolution VI.—International Statistics.

(*a*) That the Congress considers that reliable international statistical information as to fires and fire losses is essential.

(*b*) That the Congress hereby requests the International Council to prepare international statistics as to fires, obtaining the necessary data wherever possible from the respective Government departments or other authorities and societies concerned.

SOME DANGERS OF THE MOTOR CAR INDUSTRY.*

By **Percy Collins, F.S.S.**

I INTEND to confine my remarks to risks attending the manufacture and stabling of petrol-driven motor cars. I am not going to treat with cars driven by electricity, except in so far as any remarks which I may make with regard to manufacture generally may be applied, because that subject would have to deal with the dangers of electricity, and that is one which principally concerns an electrical expert.

By the term "motor cars" I mean vehicles of any description whose motive power is petrol, and by the term "petrol" I mean any product of like nature used as a motive power.

Converted Buildings and Factories.

Owing to the popularity which motor-propelled vehicles have now gained with the general public of all countries, motor car industries are cropping up in very many places, and consequently buildings which were designed and built for other manufacturing and business purposes are now being frequently converted into motor car factories and garages. In my opinion there is always a certain additional risk of danger to life when manufacturing premises are converted to a process of manufacture other than that for which they were originally built, and therefore, when so altered, special preventive measures should be adopted accordingly. To take one example. The various metal parts forming the chassis are made in different shops and are then brought to the assembling or chassis shop to be put together before the body is placed in position to complete the car. Proper lifting or running gear should be provided and free passageway maintained between these different departments. The work should be so arranged that the manufacture of the different parts and the assembling and fixing of them should, so to speak, proceed automatically in such a way that the raw material should come in at one end and be delivered in its manufactured state at the other, a system which I maintain lessens the risk of life as well as the risk of fire and consequent danger of life. Of course all the machinery should be properly fenced and guarded, a rule which applies alike to all manufacturing premises. These are, however, dangers which apply not only to the manufacture of motor cars but to manufacturing risks generally, and are points which should be borne in mind by all manufacturers having any concern for the safety of their employees. Again, a building converted to the use of a garage should, where necessary, be so altered and to such a specification that ensures the minimum risk of danger to life through fire as well as through other causes.

Petrol.

Now the special danger in motor car risks is the use of petrol, and the dangers of petrol are twofold. They are fire and asphyxiation. Therefore the points to be specially considered are how to minimize the risk of fire and the way to guard against asphyxiation.

What is petrol? Petrol is the first product obtained through the refining of crude petroleum; it is the most volatile portion of it. It has a very low flash-point indeed, and consequently requires even more than usual careful handling. I asked a petroleum refiner what was the flash-point of petrol, and his reply was, "There is no limit, it will flash at anything." Although not exactly correct, this reply was a characteristic one, and shows the absolute necessity of providing preventive measures against fire. Adequate arrangements also must be made for the vapour to escape into the open air.

There are only two departments in a factory where it is essential to have any petrol. They are the motor-testing shop and the petrol store. But generally there is some petrol as well in the reservoirs of the cars in the running shed or garage and the repair shop.

Testing Motors.

With regard to the testing of motors, this should always be carried on in a separate building entirely distinct and cut off or detached from the main works. The process of motor-testing is as follows:—After the various portions of the motor itself have been manufactured and put together it is tested (that is, it is set running) to ascertain that it is in order and running properly before being fitted into the chassis. This building should be built of fire-resisting material and should be well-ventilated top and bottom. The floor should be of concrete, and, if possible, sloping to an outside wall, and it should be drained so that any liquid should run out at the lower side of the floor, but preferably not into any system of main drainage. The motors during the process of testing should be placed on metal supports or brackets. The supply tanks containing the petrol (which, however, should not hold more than is sufficient for one day's consumption) should preferably be placed outside the building, the petrol being supplied to the motors by gravitation through metal pipes along a duct in the floor, and these pipes should be connected direct to the motors. If, however, these supply tanks cannot be so arranged outside and must be inside the building, they should be filled each morning out in the open, but should still be connected with the motors by metal piping. This building again should have no artificial heat, and should be artificially lit only by electric light, the conductors being enclosed in metal tubing, and the cut-outs and switches placed outside the building. Incandescent electric lights are preferable, but an approved type of arc lamp with double globes could be used. The duct referred to in the floor could be used also for the water pipes, water of course being necessary to keep the motor cool. A good plan is to have a water tank on the roof, and have a connection from it to supply a hydrant in the building. A good supply of buckets of sand and wet blankets should be kept in convenient places for instant use in the event of fire. Means should also be provided to immediately cut off the supply of petrol into the building in a like event when the reservoirs are fitted outside, as I have suggested.

The Petrol Store.

The petrol store should be detached and right away from any other building, and should also be built entirely of non-combustible material, having neither artificial light nor heat. The floor should be of concrete, and sunk to such a depth that it would contain below the ground level all the petrol that is likely to be in the store. Bulk should be broken in the store only, and the necessary supply for the motor-testing shop and reservoirs in the cars should be carried to its destination in metal cans to the open.

Lighting.

In the repair shop and garage, which should be separate buildings and distinct from the remainder of the works, there is generally, as I have said, petrol in the reservoirs of the cars, and for this reason these buildings should be lit by electric light. Any lights necessary to see to work underneath the cars should be portable electric lights. Oil lamps should never be used in buildings of this description. The reservoirs of the cars should never under any circumstances whatever be opened inside any building. Both operations of drawing off or filling should be carried on in the open. As strangers are admitted into these buildings, extra strict precautions should be observed against smoking. Of course, a good supply of usual fire-extinguishing appliances and buckets of sand should always be provided.

The other portions of a motor-car factory are similar to many other classes of manufactories. There are the metal machine shops, the sawmill, the body-making, paint and upholstering shops. These, however, do not call for any special remarks in this paper.

Petrol should be kept in Cans.

As I have said, petrol should be confined to the petrol store and motor testing shop, and in the repair shop and garage, but only when in the reservoirs of the cars. I have come across motor factories where, so as to thoroughly clean the different metal parts of the motor before fixing them together, they have been washed in open petrol baths inside the buildings, and these buildings have been lit by incandescent gas. An accident did not occur, but that was I am convinced only by a wonderful intervention of Providence. Needless to say that when this process has to be carried on it should be done outside in the open air.

Again, I have come across a factory where the machinery in the sawmill and car body building shop was driven by a petrol motor, the motor as well as the reservoir containing the supply of petrol for it, being in the same building, the reservoir being filled by hand from a can inside during working hours. This shop was also lit by gas. The same Providence in this case seemed to have a kindly eye also.

So much for factories.

Garages and Petrols.

Now with regard to garages and stables. Care should be taken here also never to open the petrol-reservoir of the car inside a building, but again this operation should always be carried on in the open. The garage itself—that is, the building in which the cars are stabled—should be built of non-combustible material, and should always be well ventilated top and bottom, and it is as well to have the roof ridged and open underneath at two sides so as to get a thorough draught of air continually through. Ventilation should always be provided for at the bottom as well as the top of the building, and, in fact, it is preferable to have one side of the building quite open. The repair shop, which is a necessary portion of all large garages, should be a separate and distinct building. The petrol store should be below ground, in the open, away from any buildings, and the reservoirs of the cars should be emptied into this store before the cars go into the garage. When next required they should be brought alongside the store in the open and refilled. This is advisable from another point of view, *i.e.*, to test the daily consumption of petrol in each motor. (There is always enough vapour left in the reservoir to take the car in and out of the garage.) When carbide lamps are used the store for the carbide of calcium should be built of non-combustible material and very good ventilation provided. Care should be taken to stop any damp coming into this store. The lamps should be filled in the open only, and both this operation of filling the lamps and the store itself should be kept well away from any other buildings or from the cars.

In ordinary stables the necessary small supply of petrol and carbide of calcium should be kept in the stable yard, the farthest possible away from any buildings.

A Fire in a Garage.

I have in mind one fire that occurred in a large garage. This garage was open on two sides and the roof was of iron and glass. An omnibus was brought into the garage after its day's run, and the chauffeur was drawing off what was left of the petrol. For the purpose of light he placed an oil lamp at least 12ft. away from the omnibus. It was but a very short time indeed after he opened the reservoir of the car that the vapour travelling towards the lamp caught fire, and, of course, instantly the flames ran back to the omnibus which was soon well alight. The chauffeur himself was injured, and it was only by extreme presence of mind on the part of another man, that the fire was extinguished and damage confined to this particular vehicle. The roof, however, was severely damaged and the skylights badly cracked. Had the fire not been dealt with so promptly, and had the garage been crowded, which was not the case at the time, a quantity of the glass roof would undoubtedly have fallen, and serious injury might have resulted from that and other causes.

---

* A paper read before the International Fire Congress at Milan, 1906.

Another Example.

Another case in my personal knowledge was that of a small narrow brick built stable, which just admitted one car and there was barely room for the chauffeur to pass round The car was in the stable, its bonnet facing the doors, which were shut. The chauffeur was at the back of the car doing some small repair and had an oil lamp. There happened to be a leakage of petrol vapour, and very soon the front of the car was in flames. The chauffeur was almost in a death trap, but he had the presence of mind to put his back against the back wall of the stable, and push the car forward with all his might. This had the effect of forcing open the doors of the stable, and he was then able to push the car out into the open and get out himself.

These are two of the accidents which have occurred within my own knowledge, but they are only typical of many more that have happened and will unfortunately happen in the future through carelessness.

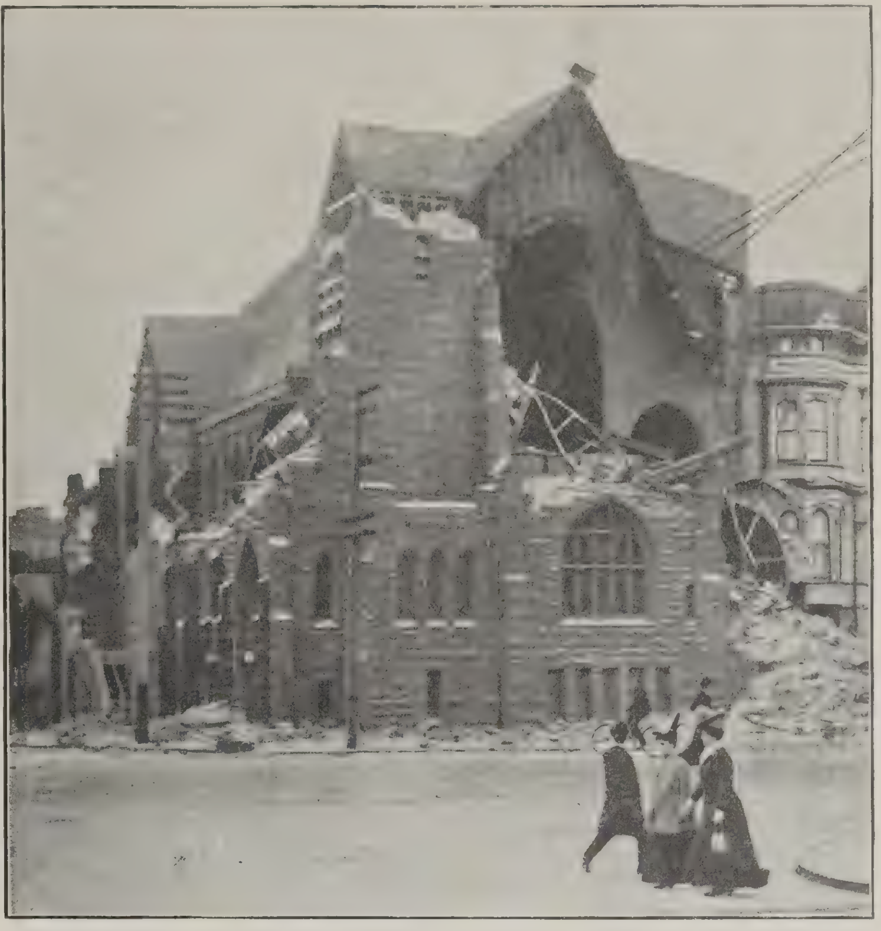

FIG. 1.—ST. LUKE'S EPISCOPAL CHURCH, VAN NESS AVENUE, SAN FRANCISCO.

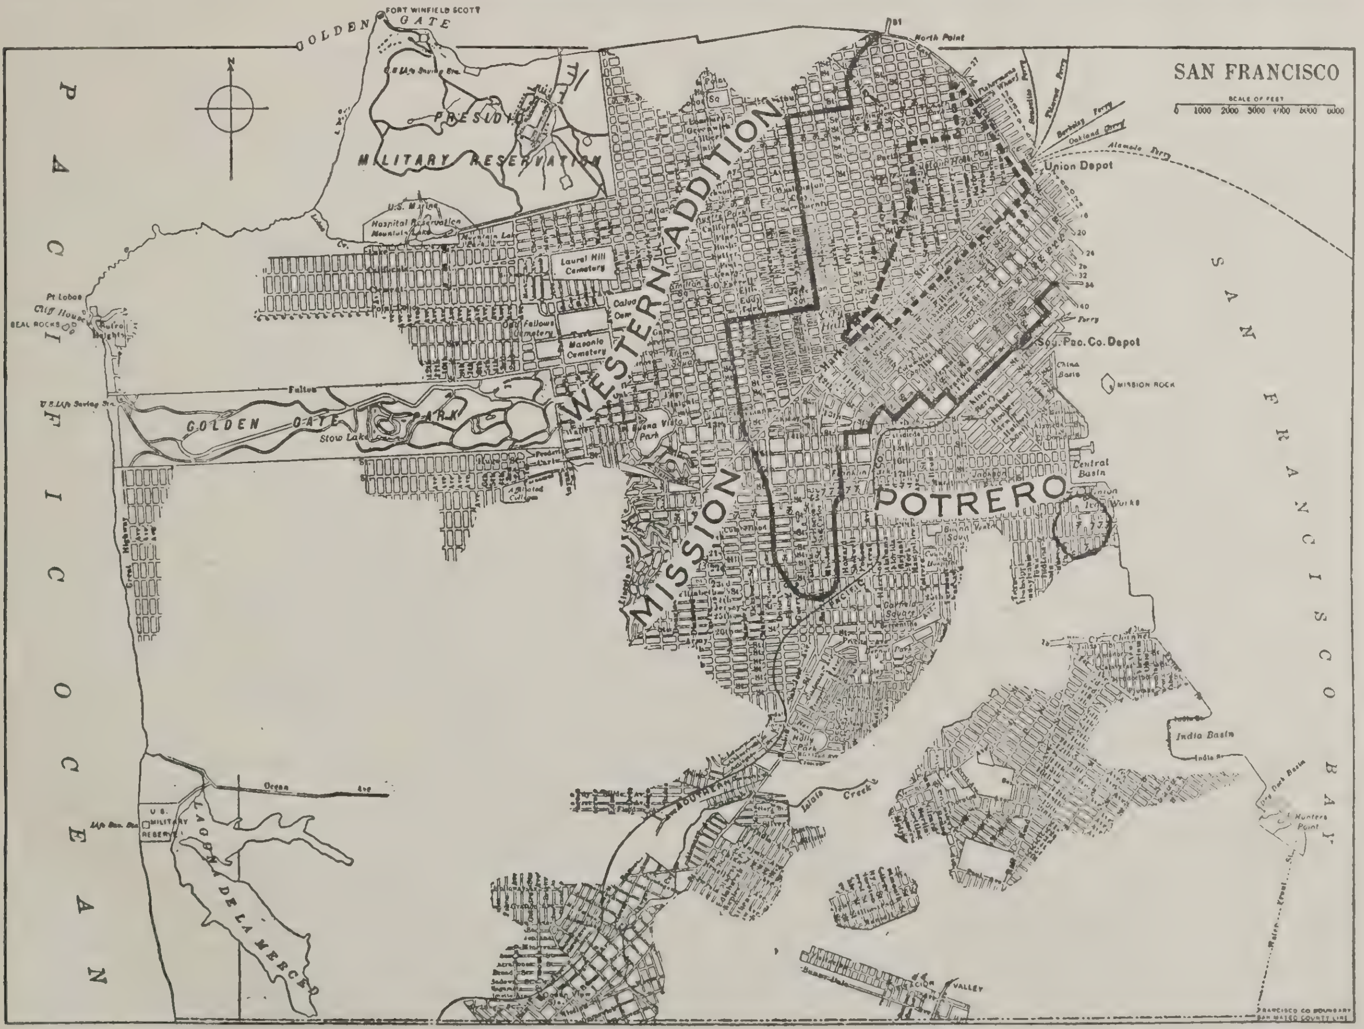

FIG. 2.—GENERAL MAP OF SAN FRANCISCO AND VICINITY.

The solid heavy line indicates the approximate boundaries of the area burned by the conflagration of April 18th, 1906. The broken heavy line shows the portion of the burned area that was composed of brick buildings, or superior structures; practically all the buildings outside of the broken line were of wood.

FIG. 3.—CITY HALL, SAN FRANCISCO, AS WRECKED BY EARTHQUAKE: FRONTAGE TO MARKET STREET, SHOWING DOME SUSTAINED BY SKELETON CONSTRUCTION.

THE SAN FRANCISCO CONFLAGRATION.

IMMEDIATELY after the conflagration at San Francisco we published in our issue of May 9th details as to the general fire hazard of this city, as also a general view of San Francisco before the fire and a detailed plan.

Two months have elapsed since these particulars were presented, and one would have thought it possible by this time to have put before our readers reliable information as to what actually occurred and how the various materials and systems of construction behaved on this occasion. We are, however, only able to do this at present in quite general terms, for owing to the havoc wrought at San Francisco and the general upset of all business and correspondence arrangements, it is extremely difficult to obtain useful information at all, and such information as reaches us is, we regret to say, for the most part of an *ex-parte* character, transmitted by the various constructional firms interested in describing their works as having resisted fire in the most glowing language.

Fake Photographs.

Some of these *ex parte* particulars that reach us are accompanied by photographs, but even these photographs do not tell a true tale, for as we have been warned by several correspondents it has become the unfortunate practice of various specialist firms in America to prepare what would be commonly termed "faked" photographs, and we have actually cases in mind where buildings in outlying suburbs, scarcely affected by the fire, or at the most merely scorched, have been particularly prepared for the purposes of photography with a fine collection of débris specially arranged at suitable points, the copies of such photographs afterwards being used for trade purposes. The example for this kind of thing was probably started after the Baltimore conflagration, when the energetic salesmen of a well known local firm simply took the photograph of a building that had practically been entirely destroyed by fire with the exception of its back wall, placing his camera so that only this one back wall could be seen.

Concrete and Reinforced Concrete.

But we have received sufficient general data to be able to state quite definitely that concrete in floors and concrete as a protection to steel frame has withstood extraordinarily well both the action of the earthquake shock and the fire. Further, that the few examples of reinforced concrete construction in the form of floors made a most perfect showing, and that, speaking in general terms, concrete and reinforced concrete have proved themselves so efficient under the very trying circumstances of the San Francisco catastrophe that it may be safely assumed that concrete and reinforced concrete will be the order of the day for a great deal of the rebuilding of this great Californian centre.

It is unfortunate that there was apparently not a single entire reinforced concrete building in the San Francisco fire area, but one or two buildings of reinforced concrete frame construction, with brick external walls, were in course of erection, and these made a good showing. It is also regrettable that as far as these reinforced concrete examples were concerned there was no instance where they were actually subjected to any great severity of fire.

Thus, San Francisco does not afford that example we had hoped for of a reinforced concrete building successfully withstanding actual conflagration conditions any more than this was the case at Baltimore.

Months will probably elapse until we can present useful technical details as to the lessons to be learnt from the San Francisco fire. We must await the official reports—the reports of the fire underwriters and also the reports of the technical institutions.

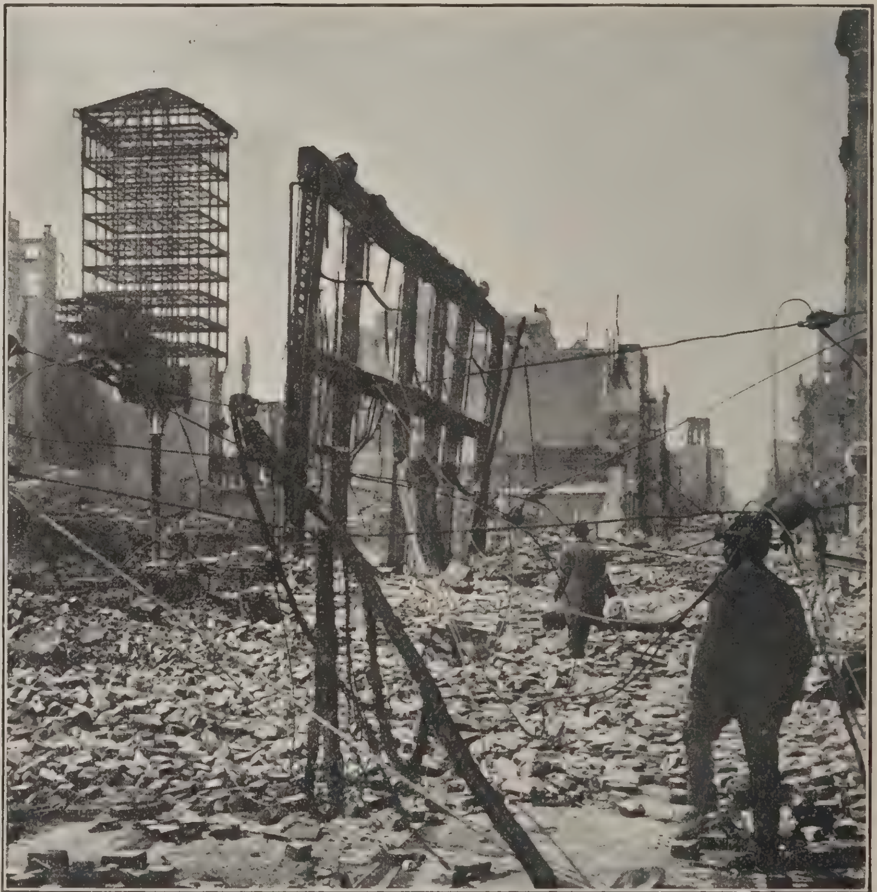

Photo: White Co.

FIG. 4.—POST STREET SAN FRANCISCO, ONCE A BUSY SHOPPING CENTRE.

But apart from the success of concrete and reinforced concrete, there can also be no doubt that a well-framed steel building having its steelwork properly protected by brick or porous terra-cotta embedded in Portland cement makes a good fire-stop, which is, however, also the case with a really substantially built structure on the older and more expensive lines of the monumental works of earlier days, where solid wall construction and brick arched flooring have been used.

Our Illustrations.

In the current issue we show a plan indicating the extent of the area affected by the fire, also a small general view. Next we show the following:—Fig. 1, St. Luke's Church, Van Ness Avenue (this shows the effect of the earthquake shock on a stone structure; the church was afterwards completely destroyed by fire); Fig. 2, a general map of the area destroyed by fire; Fig. 3, the City Hall (this is another example of the want of resistance to earthquake shock displayed by stone or brick structures; the dome sustained by the steel skeleton affords an important comparison of the two systems of construction); Fig. 4 shows part of the area of brick and stone structures destroyed by fire (the steel-frame building on the left is apparently in course of erection); Fig. 5, the Call Building (showing that a properly constructed skyscraper of steel skeleton frame construction will resist both earthquake and fire); Fig. 6 is another example of a steel frame still standing, although the construction was not fire-resisting; and Fig. 7, the well-known Fairmount Hotel.

These photographs are characteristic, but we do not wish to say that they are particularly instructive at the present stage and without technical details; and again referring to the difficulty of obtaining reliable details it must be remembered that the student will have to discriminate as to the amount of damage done to a building by shock before the question of fire-resistance arises.

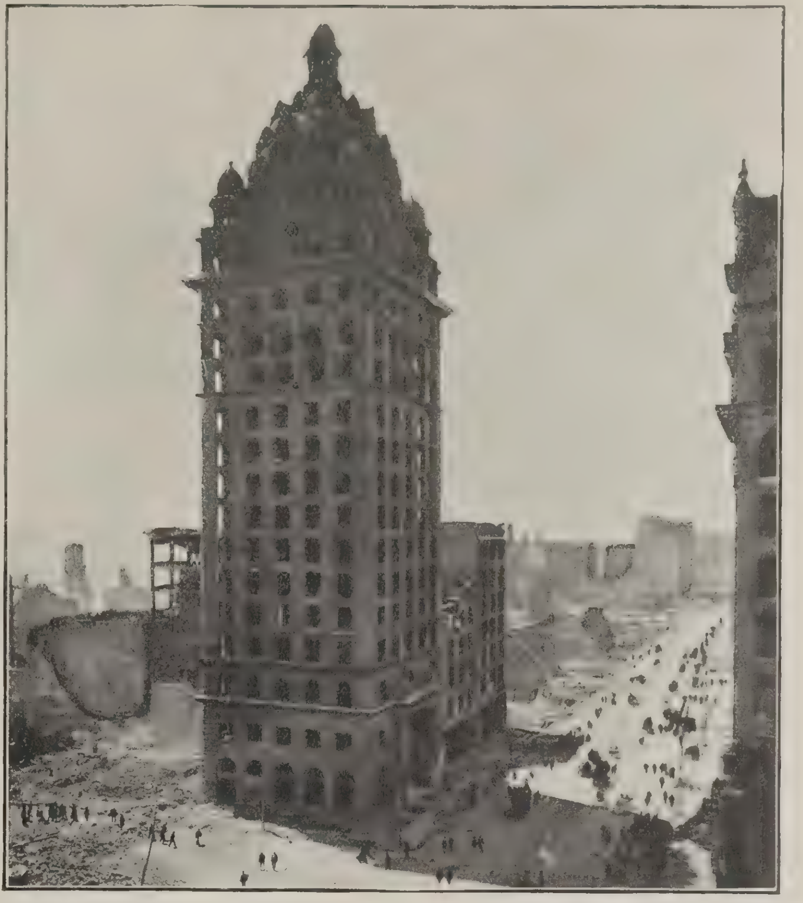

Photo: White Co.

FIG. 5.—THE CALL BUILDING, SAN FRANCISCO.

A steel-frame structure that stood both earthquake and fire, as seen from the eighth floor of the wrecked "Chronicle" Building. The burned mission district is shown in the distance.

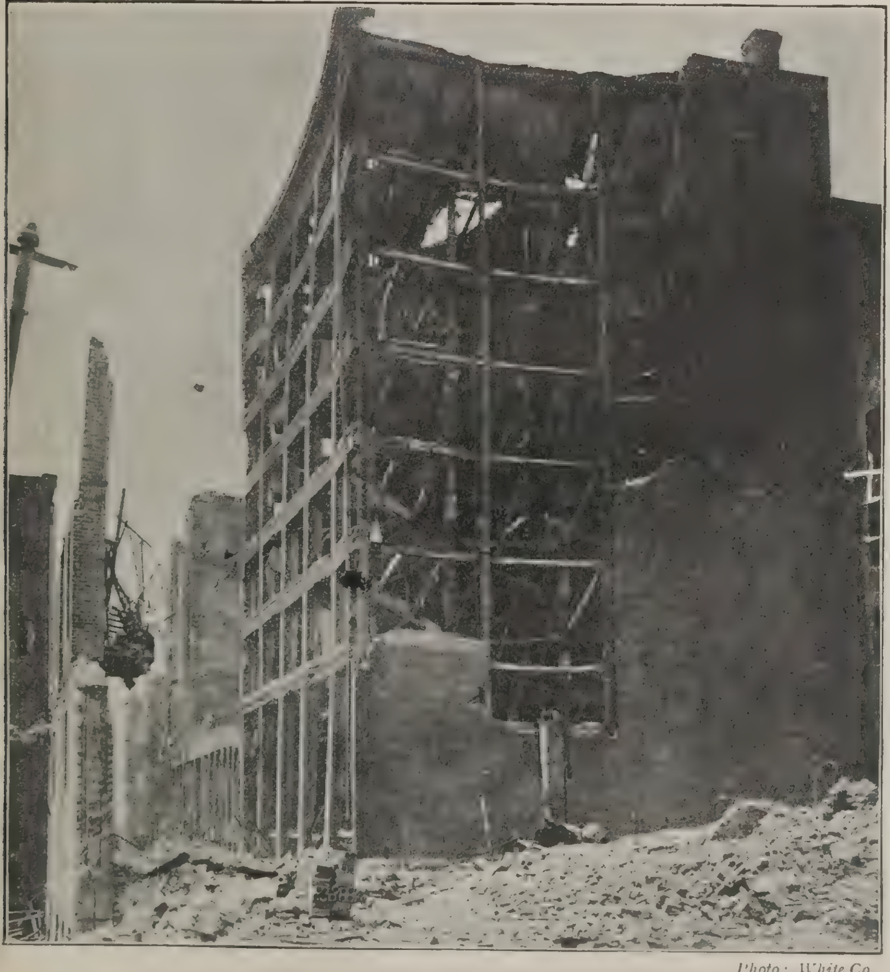

Photo: White Co.

FIG. 6.—THE KAMM BUILDING SAN FRANCISCO.

As to the cause of the great conflagration, its direct cause must be attributed to the earthquake having started numerous fires and at the same time having disorganized the water-supply, the result being that the fire brigade found too many fires on hand to cope with, and had not the necessary extinguishing element—namely, water—at their disposal.

THE LAMBETH FIRE.

We do not illustrate the Lambeth fire, as a careful examination of the ruins did not show us anything that was really of an instructive character, *i.e.*, there were no structural lessons to learn—there was only the general lesson, obvious to all, that property of this description is a serious danger in the midst of a thickly-populated neighbourhood, and that given such circumstances as a heavy gale of wind, a fire commencing in a timber store and joinery workshop could easily some day result in a large conflagration. But London, as a rule, has the good fortune not to have serious fires started during a gale of wind.

Regarding the cause of the Lambeth fire, the suggestion has been put forward on very high authority that it was due to a timber baulk entering into a chimney flue.

The Birmingham Watch Committee's Report should be interesting to the architect and builder, for it tells us that out of 719 fires 120—or about 1 in 6—were fires caused through timber used in the construction of the building being too near the fireplace. This has often been the cause of fires, and special attention needs to be given to it.

NEW FRENCH REGULATIONS

As to Means of Escape from Fire in Shops, Factories and Workshops.

THE following model by-laws have been issued in France for factories, shops and workshops, and should be of interest to architects and local surveyors in this country.

(a) Exits.

The doors of workshops, shops or offices should open outwardly, whether they open on to courts, vestibules, staircases or interior passages, or whether they give access to the open air. In the latter case this is not obligatory unless it has been judged necessary in the interests of safety.

If the doors open on to a passage or staircase, they must be fixed in such a manner as not to project into the passage or staircase when open.

The exits must be sufficiently numerous to allow of rapid egress from the premises; they must always be free and never blocked up with merchandize, stocks or other objects. In large buildings signs, placed in very conspicuous positions, should be fixed indicating the quickest and nearest way out.

In workshops, shops or offices where inflammable materials are handled, if the windows are protected by wirework or gratings, these should be so fixed as to open up outwardly, so that in case of need the windows may form additional means of exit.

(b) Staircases.

Staircases in offices or other buildings serving as places for work shall be constructed in incombustible materials, or shall be walled-in fully in plaster.

The number of these staircases shall be in proportion to the number of persons employed and exits provided from the different floors of a building containing offices or workshops.

A decision of the Ministry of Commerce, taken on the opinion of the Consultative Committee of Arts and Manufacturers, can always, if safety demands it, prescribe a minimum of two staircases.

Each staircase must be able to serve for the simultaneous exit of twenty persons at most, and must have a minimum breadth of 3ft. 3ins.; this breadth must be increased by 6ins. for each new group of fifty employees (or under) using it.

The passages leading into the rooms, also the landings leading on to the staircases, must be of equal width, and must be free from all encumbrance, such as furniture, merchandize or material.

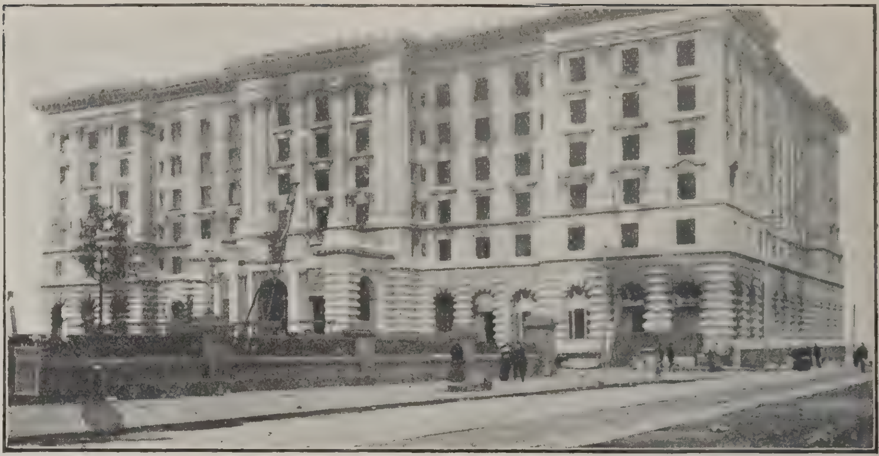

FIG. 7.—FAIRMOUNT HOTEL, NOB HILL, SAN FRANCISCO, SLIGHTLY DAMAGED BY FIRE.

(c) Lighting and Heating.

It is prohibited to use any liquid emitting inflammable vapours inflammable under 35 degs. C. for the purpose of lighting or heating unless the apparatus containing the liquid is solidly closed during work, that part of the apparatus containing the liquid being so closed as to avoid any oozing out of the liquid.

During working hours the refilling of the apparatuses for lighting or heating, for liquid combustion, be it in the workrooms, in the passages, or on the staircases used for the exit of the staff, can only take place by daylight, and on condition that no stoves are alight.

The pipes conducting the gas to the lighting and heating apparatuses must be of metal or covered in metal.

The flames in the lighting apparatuses or portable stoves must be at least 1 millimetre distant vertically and 30 centimetres horizontally (laterally) from all inflammable construction, furniture, stock; lesser distances may be permitted if necessary, as far as walls or ceilings are concerned, if a fire-screen of incombustible material be used which does not touch the wall to be protected.

The portable lighting apparatuses to have a stable and solid base.

Portable or fixed lighting apparatuses must, if the necessity be recognized, be provided by glass, by a globe or wirework, o such other protective covering to prevent th flame entering into contact with inflammabl material.

All inflammable liquids, also material impregnated with such substance or fatt substances, must be kept in metal receptacle closed and air-tight.

These receptacles, as also the gasometer and the receptacles for oil lamp petrol, mus be kept in isolated places and never in th neighbourhood of passages or staircases.

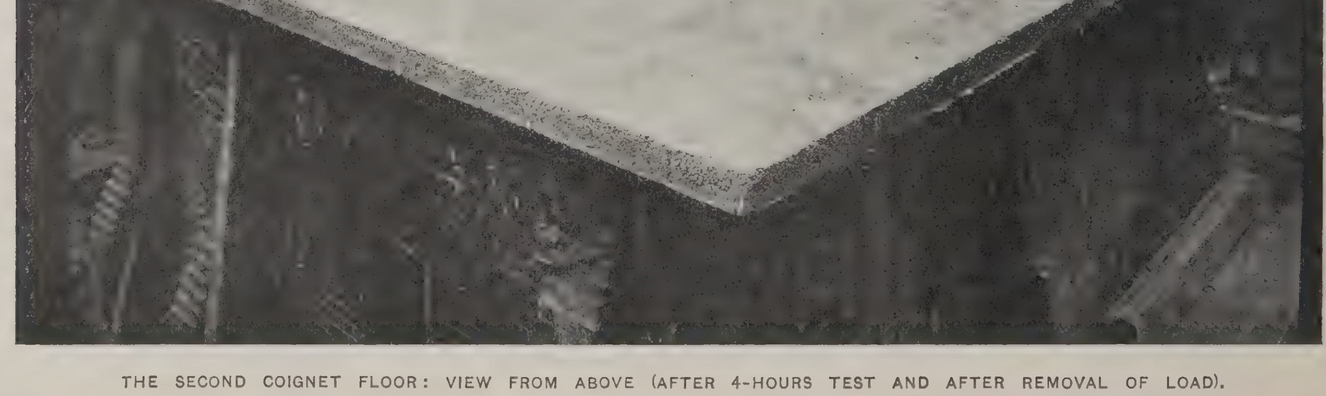
(d) Instructions in case of Fire.

The principals of the establishment shal take the necessary precautions that at th very outbreak the fire may be rapidly an effectively combated.

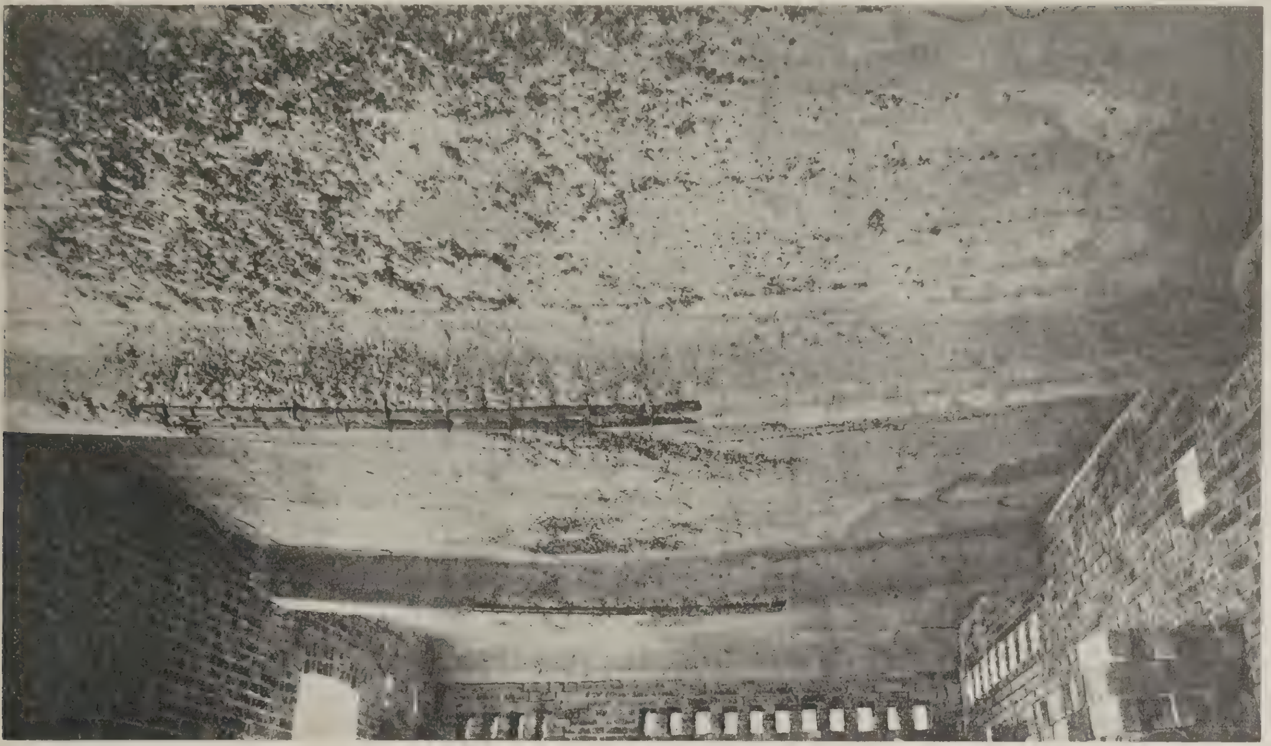
Instructions shall be put up in every par of the building where workpeople ar assembled indicating the means of extinction and of saving which are available, an the procedure to be adopted in case of fire with the names of those responsible for th proper carrying-out of these instructions.

These instructions will prescribe periodica drills to assure that all the materials an appliances be in good condition, and tha the staff may be acquainted with thei usage.

These instructions to be communicated t the foreman on the works; the principal o the establishment is responsible for thei execution.



THE SECOND COIGNET FLOOR: VIEW FROM ABOVE (AFTER 4-HOURS TEST AND AFTER REMOVAL OF LOAD).



THE FIRST COIGNET FLOOR: VIEW OF UNDERSIDE (AFTER 3-HOURS TEST, LOOKING NORTH).

FIRE TESTS.

Reinforced Concrete Floors.

Of the series of reinforced concrete tests that are being undertaken by the British Fire Prevention Committee, two, dealing with floors on the Coignet system, are of the highest possible interest, having regard to the fact that the results can be so easily compared.

Here we have two floors constructed on an identical system, covering an identical area, subject to identical conditions as to application of fire and water, and we only have the difference in construction and time to consider.

In the first test, a three-hours test, the area was divided into three bays; in the second test, a four-hours test, it was divided into four. In the first test the floor rested on the set-off of the surrounding walls; in the second it projected over the walls. In the first case the concrete aggregate was a clinker aggregate; in the second case the aggregate was a furnace slag aggregate. In both cases, however, the cement used was identical, namely, "Ferrocrete" cement being employed.

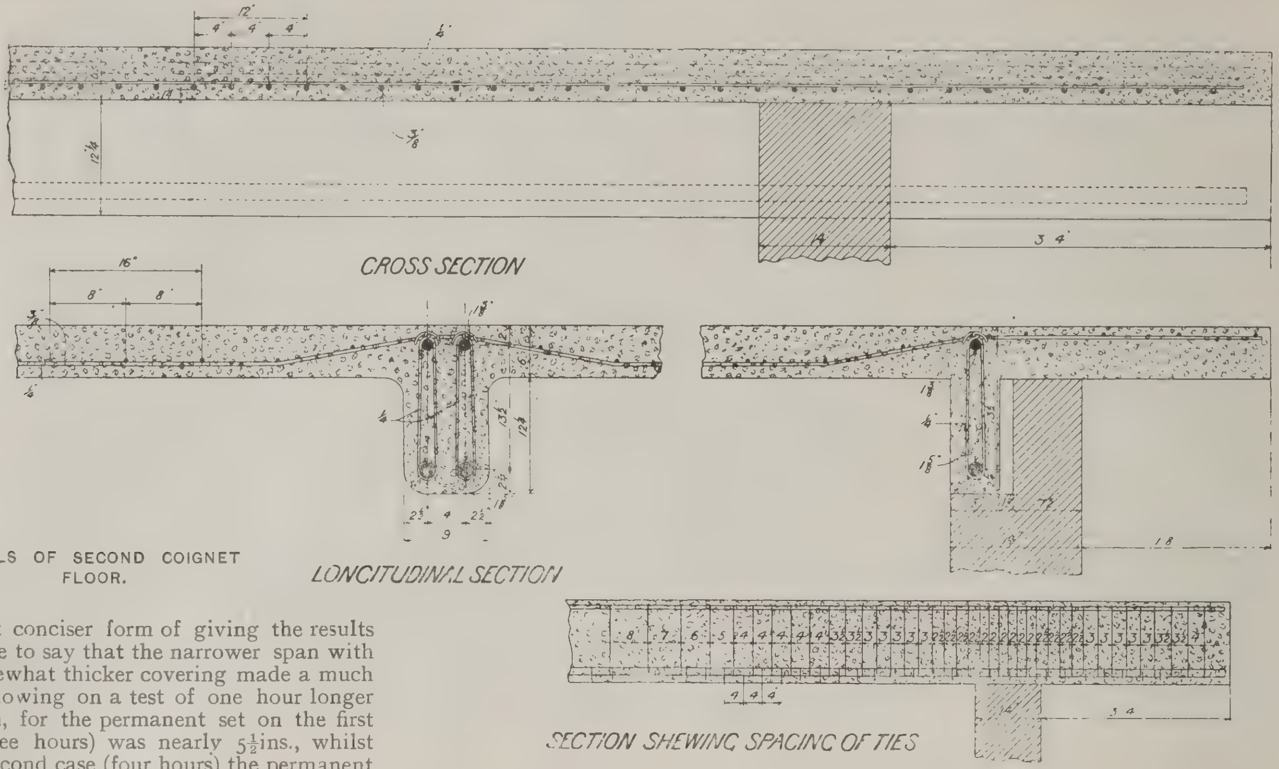
There was also some difference in the thickness of the protective covering to the metalwork in favour of the second test, where the covering was thicker.

Regarding the slag concrete used in the second test, the slag was from an iron foundry at Northampton, and the concrete was made up as follows, namely: $2\frac{1}{3}$ parts of the furnace slag broken small enough to pass a mesh of $\frac{3}{16}$in., 3 parts of furnace slag broken small enough to pass through a 1in. mesh, to 1 part of Portland cement, 13 gallons of water being used to gauge every $3\frac{1}{3}$ cub. ft., and the material being turned over twice dry and once wet.

In the first case the time allowed for drying and setting was forty days, and in the second case thirty-nine days. In each case the centering was struck after fourteen days.

Now the nett result of the two tests are best expressed by presenting the two summaries of the respective reports side by side in tabular form—first the three-hours test and next the four-hours test.

THE SECOND COIGNET FLOOR: VIEW OF UNDERSIDE (AFTER 4-HOURS TEST, LOOKING NORTH).



DETAILS OF SECOND COIGNET FLOOR.

A yet conciser form of giving the results might be to say that the narrower span with the somewhat thicker covering made a much better showing on a test of one hour longer duration, for the permanent set on the first test (three hours) was nearly 5½ins., whilst in the second case (four hours) the permanent set was only 1¾ins.

Again, in the first test, the classification attained ranked as "fully-protective," but only for Class A, owing to the shorter duration of the test; whilst for the second test "fully-protective" classification was attained under the heading "Class B," which comprises the maximum standard classification in Great Britain, practically coinciding with the top standard classification of the United States.

Comparison with other Tests.

We have recorded the tests of the Fire Prevention Committee with other concrete and metal floors, be they termed reinforced concrete, armoured concrete floors or otherwise. Whilst some of the previous floors were not entirely reinforced concrete floors in the true meaning of the word, the beams not being of reinforced concrete, in this instance we have the first example of a leading reinforced concrete system under investigation and passing the universal standards necessary for safe building. Given a slightly thicker protection to the metalwork in a suitable aggregate, the deflection should be nil on the narrower span; and given substantial protection of, say, 2½ins. to 3ins., it should even be nil with the wider spans. The essence of the fire-protective quality appears to lie in obtaining the best possible aggregate that will not fly off, and applying it in a sufficient thickness to keep the metalwork from getting hot. Two inches is what the Fire Offices require in this country; 3ins. is what is required in the United States, and probably (as far as beams and columns are concerned) the medium between these two figures, namely, 2½ins. nett, is what should find general acceptance.

The Thickness of Concrete below.

The resolutions of the recent Fire Congress at Milan speak of a minimum of 2ins., and are careful to point out that no portion of the aggregate should be larger than will pass through a 1in. mesh, but we shall not be surprised as time goes on to find this figure slightly increased and to find building legislation and Fire Office rules figuring 2½ins. for all beams, and probably even slightly more for columns.

The British Fire Prevention Committee's test is eminently instructive. It will be followed, we understand, by further tests on reinforced concrete, with all the important systems hailing from the United States, and as time goes on we may also no doubt anticipate tests with further Continental systems.

There is one point that should not be overlooked, however, in the design of the floors that were under test on the Coignet system. The upper members in the beams were stirruped together with the lower members, and these upper members must play an important *rôle* in reducing the possibility of deflection.

We now present the summaries: —

Fire Tests with "Coignet" Reinforced Concrete Floors.

Section under test, 15ft. by 22ft. 3in. "Universal Standard" conditions. Load, 2½ cwt. per ft. super.

FIRST TEST.	SECOND TEST.
3 *hours of fire* (*to* 1,800 *F.*). 5 *minutes of water.*	4 *hours of fire* (*to* 1,800° *F.*). 5 *minutes of water.*
The time allowed for drying was forty days (autumn).	The time allowed for drying was thirty-nine days (spring).
The centering was struck after fourteen days.	The centering was struck after fourteen days.
Summary of Effect.	*Summary of Effect.*
Within 1 minute after the lighting of the gas the plastering to the soffit of the floor began to fall, and continued to do so until the end of the test. After 15 minutes the floor began to deflect downwards, and continued to do so until the end of the test, when a maximum deflection of 5·60in. (·140 m.) was observed.	At the expiration of 30 minutes the floor began to deflect and continued to do so till the end of the test, when a maximum deflection of 4·30in. (·109 m.) was observed. Simultaneously, the overhanging parts of the floor on the east and west sides began to rise, and continued to do so till the end of the test, when a maximum rise of 3·10in. (·079 m.) was observed.
On the application of water the concrete to the soffit of the beams where struck by the jet was knocked off, exposing the iron rods in the lower part of the beams. The soffit of the floor was also eroded where struck by the jet, exposing in two bays the longitudinal iron rods.	On the application of water the concrete to the soffit of the beams where struck by the jet was knocked off, exposing one rod in the lower part of beam A for about 4in. (·10 m.) and two rods in beam C for about 6ft. (1·829). The soffit of the floor was also eroded where struck by the jets.
On the load being removed it was found that the upper surface of the floor showed transverse cracks in the direction of the beams and diagonal cracks at the corners.	On the load being removed it was found that the upper surface of the floor showed transverse and diagonal cracks.
The permanent set of the floor was average 5 7/16in. (·138 m.). Neither fire, smoke, nor water passed through the floor.	The permanent set of the floor was average 1¾in. (·044 m.). Neither fire, smoke nor water passed through the floor.
	Classification: "Fully-protective (Class B)" was obtained.

SAFETY IN THEATRES.

ON the important question of the fire-resistance of scenery, the London County Council have been making some interesting experiments, which are reported in the Minutes. As a result of their enquiry the Theatres Committee were of the opinion that the degree of fire-resistance obtained by dipping light fabrics in the fire-resisting solutions usually employed is quite satisfactory, and that as regards scenery generally the degree of safety that is obtained by brushing over the back of the canvas is all that could be required. They, however, go on to indicate that there is a doubt as to whether the efficacy of the treatment is impaired when the scenery is in constant use, and thus a further report will be called for some six months hence.

We are very much at one with the London County Council's endeavour to investigate this question of the fire-resistance of scenery, but such investigations are of course quite *ex parte*, inasmuch as they are solely undertaken in the interests of the public authority, and not in the joint interests of the theatre manager and the representatives of the public by some independent third parties, as should be the case.

Further, the question has not only to be considered as to whether the efficacy of the treatment remains, which we agree is doubtful beyond a certain very limited period, but whether such treatment does not affect very seriously the value of the theatre manager's property by dimming the colours, which gradually fade, and further rotting the canvas.

The Special Commission of the British Fire Prevention Committee visited Italy on the occasion of the Milan Congress, returned to London by way of Lucerne, Zurich, Strassbourg and Mulhausen, in each of which cities the Public Authorities accorded the Commission every facility to obtain an insight into the fire-preventive arrangements and fire-service organization; also extending their hospitality to the members of the commission, who comprised Messrs. Edwin O. Sachs, F.R.S.Ed. (chairman), Ellis Marsland (hon. sec.), Max Clarke, F.R.I.B.A., James Sheppard, A.I.E.E., Percy Collins, F.S.S., and F. Farrow, F.R.I.B.A.

SPECIAL SUPPLEMENT.
The Ritz Hotel, Piccadilly, London.

Public Spirit in the East. THE Whitechapel Art Gallery is a notable effort to bring a little culture into the sordid lives of the residents of the East End. There is now open in it, until July 19th, "The Country in Town Exhibition," an attempt, firstly, to educate the public in those little arts and industries which will enable gardens to be created on window-sills and on roofs, and, secondly, to awaken interest and understanding in the plants, birds and animals to be found in our public parks. The exhibition, however, covers a wider ground by showing what has been done in the creation of garden cities such as those at Letchworth, Bournville, and Port Sunlight, and in these sections there are many photographs and drawings of designs for small houses, as also the interesting suggestions of Professor Patrick Geddes for improvements at Dunfermline and Edinburgh, and Mrs. Barnett's proposed Hampstead Garden Suburb. The Metropolitan Public Gardens Association also exhibit plans of the various improvements with which they have been concerned; and particularly interesting is the exhibit of plans, photographs, drawings and publications lent by the Town Council of Dresden, showing the manner in which the growth of cities in Germany is controlled and the precautions that are taken by the drawing up of a thoroughly-thought-out scheme to avoid the problems that arise where there is no appreciation of future developement. The most interesting exhibit, however, is a scheme for the improvement of Mile End Road, Spitalfields and Shadwell districts, drawn up by Mr. Imre Kiralfy, the well-known organiser of Earl's Court and other exhibitions held in London. Mr. Kiralfy has always shown talent for making schemes financially possible which seem too imaginative. We feel, therefore, that although this scheme of his is so ideal, it is not beyond the bounds of possibility. He assures us that it would be financially profitable even to private individuals or financiers as an investment. If that is so, then we do not despair of public authorities taking up the matter. With the Mile End Road, Mr. Kiralfy's task was easy. Waste land exists along the sides, and he feels it only necessary to lay out gardens there. Spitalfields, however, is a crowded district for which there seemed little hope until Mr. Kiralfy showed how an improvement could be effected. His plan shows how to widen the various streets (without the sacrifice of any floor space in buildings) by pulling down low buildings and erecting high ones in their place. The chief point in Mr. Kiralfy's scheme is that he would replace the old houses between Dorset and White Streets with a garden, and the triangle between Commercial Street, Shepherd's Street, and a new street to be made, by another garden. The block of houses including those in Butler Street, Freeman Street, Palmer Street and Tilley and Tenter Streets Mr. Kiralfy would replace by a lofty trades emporium, somewhat on the lines of the French and Belgiam bazaars or the American stores. The treatment, however, for the dreary Shadwell district is the most captivating. The area around Shadwell market, now closed, seems at present like one of those ancient cities of the dead. Mr. Kiralfy would transform the whole area. He would pull down the wretched buildings surrounding the market and erect a series of large buildings, three of them facing a fine recreation ground with a terrace leading down from the hill above, and through one of the large buildings he would construct an arcade leading to another garden. Finally, he proposes pleasure gardens sloping down from High Street in terraces 220ft. wide by 90ft. deep. The pleasure gardens, 250ft. wide by 180ft. deep, would have a bandstand in the centre and imposing buildings on either side. On the Thames front he would arrange a museum and library with a fine verandah and terrace 60ft. wide by 200ft. long, directly facing the Thames, and below these, public swimming baths, assembly halls, gymnasiums, &c. Such a river terrace with public buildings would really be a magnificent improvement for the East End of London, and we can only hope that Mr. Kiralfy's suggestion will receive careful thought by the London County Council and local authorities directly concerned, and that it may lead to action.

Public-Houses. IT is much to be regretted that the majority of public-houses in this country are designed with such a display of tawdriness. This is not so much the fault of the architects, however, as of the public. There are a few architects who have obtained a reputation for public-house work, and who take trouble to produce quiet, respectable buildings; but most brewers and publicans seem to employ the smaller fry of the profession because they feel that they can dictate to them and secure the blatant specimens which we so constantly see—specimens which evidently satisfy the taste, or want of taste, of the owners. In respect of this matter, we notice that some very interesting remarks were made last week by the chairman of the Birmingham Transfer Sessions, Mr. Alexander M. Chance, holding out a promise of better things. Many architects were in court in connection with the various applications for alterations to licensed premises, and the chairman said he wanted to call their special attention to the style of public-house buildings, and, through them, to direct the attention of the brewers they represented to the matter. His colleagues on the Bench, he added, fully concurred in what he was about to say. He was not going to be so foolish as to raise the question of taste, but he wanted to point out that, whilst terra-cotta had its advantages, sometimes it might be of tints which they were not altogether accustomed to associate with that material. He thought that, for the benefit of the city, more variety was needed in the style of public-house architecture. For instance, he could not understand why an architect should not take advantage of some of the beautiful specimens of oak buildings which they saw scattered about the country at Chester, Hereford, Leominster, and other places. Glaring colours should be avoided. He felt sure they would like to improve the general appearance of the Birmingham streets, and to effect this he thought architects should adapt the style of architecture somewhat to the surroundings of the neighbourhood and to the name of the house. With these very moderate remarks we are in sympathy, and it is to be hoped that when the persons in authority express such decided views, some reform may be effected among the publicans and brewers seeking to alter and rebuild their premises. The part which these Birmingham magistrates are playing is allied to the public censorship which has so often been advocated in the matter of architectural design, and if the suggested censorship could be worked as smoothly and as logically as this, we should all wish that it were established immediately.

R.I.B.A. EXAMINATIONS.

Model Answers by A. G. Bond, B.A., A.R.I.B.A.

The Intermediate Examination.

Subject I.—Varieties of Classic Ornament.

[*Time of examination, one hour-and-a-half. Maximum number of marks* 50.]

1. *Give a sketch of any well-known example of a Corinthian capital, the diameter of the column to measure* 1½*ins., stating where it is taken from.*

See sketch below.

2. *Show by sketches to a bold scale the method of projecting the plan and elevation of a Corinthian capital.*

See sketches below.

3. *Illustrate by description and bold line drawing, showing one or more of the methods employed for delineating the Ionic volute.*

See sketches.

4. *Illustrate by description and bold line sketches at least four of the following terms:—Abacus, astragal, caulicolæ, cavetto, dentils, epistyle, guttæ, scotia.*

Abacus: A rectangular member between the capital and entablature. It varied very much both in depth and shape on plan in the various styles and countries. (Fig. 1.)

Astragal: A small bead or circular moulding (a small torus) often occurring between larger mouldings in place of a square fillet. (Fig. 2.)

Caulicolæ, or Caulicoli: The slender stems springing from the caules (Latin, *Caulis*, a stalk), the eight greater stems around a Corinthian capital. (Reference could be made to those shown in the capital in question 1.)

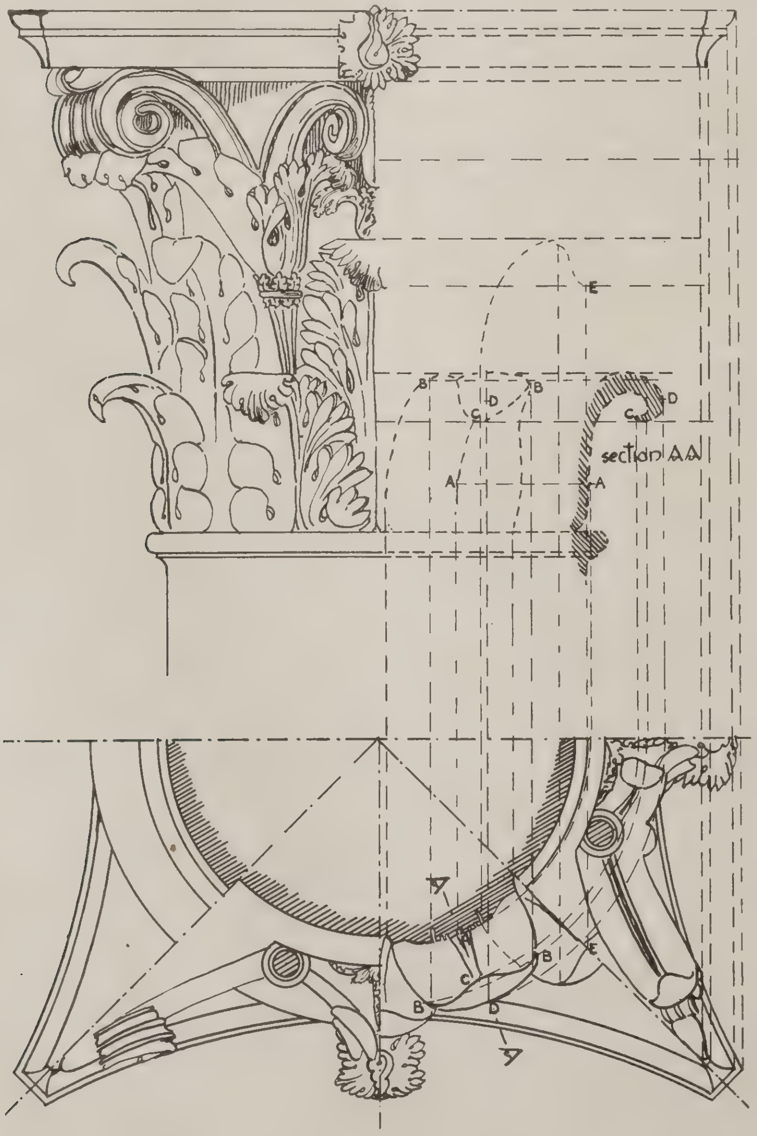
Cavetto: A simple hollow or concave moulding. (Fig. 3.)

Dentils: Tooth-like ornaments occurring first in the Ionic cornice. (Fig. 4.)

Epistyle: (Greek, 'επι στμλος upon a column). Epistylium or architrave, the lowest of the three principal divisions of the entablature of an Order. Fig. 5 shows a Corinthian example.

Guttæ: The small truncated cones or pyramids in the Doric Order used under the triglyphs in the architrave below the tænia and on the underside of the mutules of the cornice. (Fig. 6.)

Scotia: The hollow moulding to the base of the column between the fillet of the torus mouldings. In the Roman it was generally formed by the junction of arcs of different radii, but in the Greek work it was an elliptical curve. (Fig. 7).



SUBJECT I:—ANSWERS TO QUESTIONS I AND II.

Subject II. — The Characteristic Mouldings and Ornaments of each Period of English Architecture from A.D. 1000 to 1550, with their Application.

[*Not more than four questions to be attempted. In all illustrated answers sufficient jointing must be clearly indicated to show construction; but mere repetition, in any form, is not wanted. Time of examination, two hours. Maximum number of marks* 75.]

1. *Write a brief account—illustrated by marginal sketches—of the gradual change in the sectional profile of stone vaulting ribs during three centuries from c. A.D.* 1100 *onwards, the connection of the rib with the vault-filling to be clearly indicated in the sketches.*

The changes in the sectional profile of English stone vaulting ribs may be divided into three phases. First, the tendency was to diminish the dimensions of the ribs; secondly, the visible mouldings were varied, following very much the same changes as the mouldings of other features of the same periods, care being taken that when lierne and other subsidiary ribs were introduced the moulding should be such that it could be subdivided without awkward mitres; and thirdly, constructive changes took place in the section of the rib—thus in the earliest the filling was carried over the rib entirely, but later the rib itself was rebated to take the filling, until at the end of the fourteenth century the rib and filling are worked from one stone, the filling really becoming merely a sunk panel on the face of a solid spherical vault. The three marginal sketches, which are drawn approximately to the same scale, illustrate these several changes (see p. 18).

2. *Illustrate, full-size, in a workmanlike way two typical thirteenth-century capitals to circular stone shafts 4ins. in diameter.*

(1) *Moulded only.* (2) *Foliated.*

See illustrations on p. 18.

3. *Draw, in full-size section, a series of base mouldings (three at least), each of a different century, to stone shafts 4ins. in diameter, assigning to each approximately an appropriate date.*

See sketches on p. 18.

4. *Write a brief account—illustrated by marginal sketches—of the gradual change in the sectional form of main-arcade arches during three centuries from c. A.D.* 1100 *onwards, the relation of the arch-mould to its supporting pier or column to be clearly indicated in the sketches by showing their respective positions on plan one over the other.*

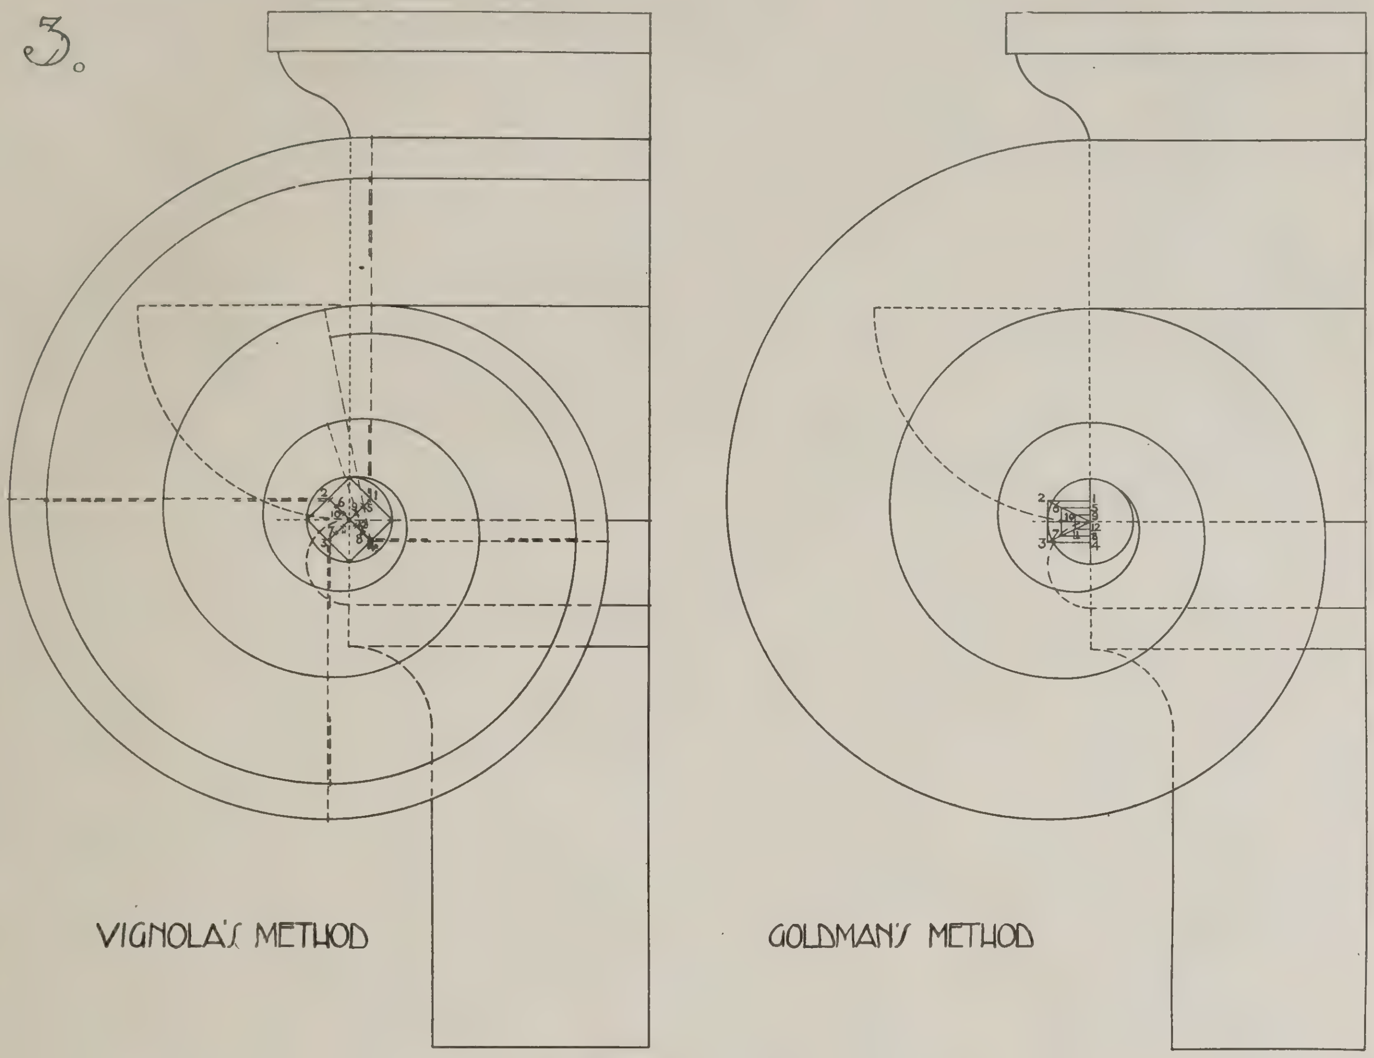
In the twelfth century the nave arcades were usually semi-circular in form and built in receding orders, sometimes plain but often enriched with simple bowtels or zigzag moulding; the piers were massive and either round, square, or built in orders similar to the arch, or with shafts.

The pier and arch were in all cases separated either by a capital or string, and the later shafts occasionally had a band about half-way up.

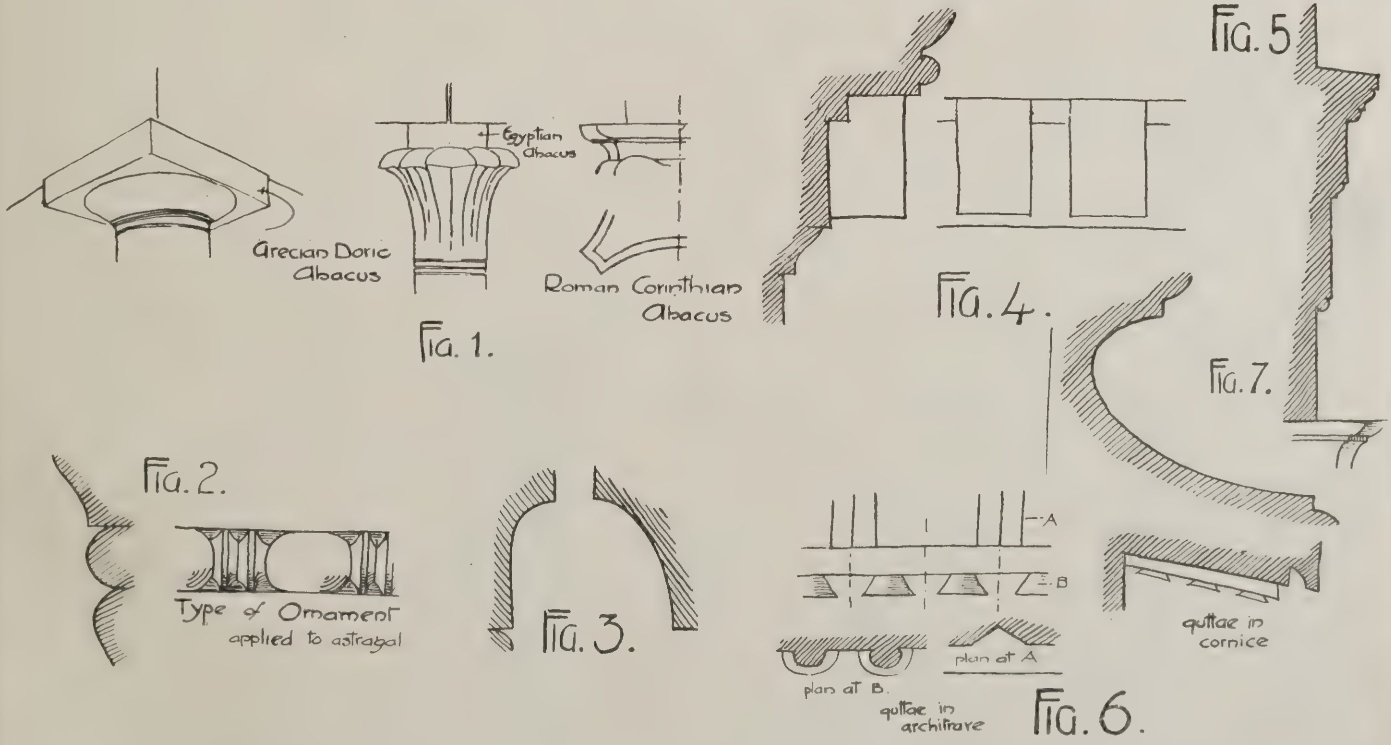
In the thirteenth century the arches were generally pointed, sometimes lancet, very richly moulded and often enriched with dog-tooth ornament. The arch mouldings were intricate and undercut and were often in quite irregular planes.

The piers, generally circular, almost always have bands and surrounding shafts, often detached.

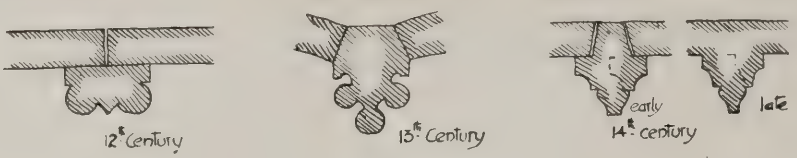
3.



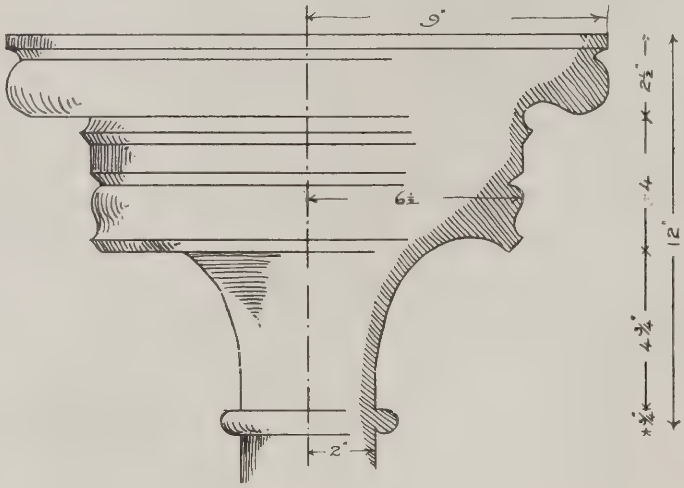
ANSWER TO QUESTION 3.



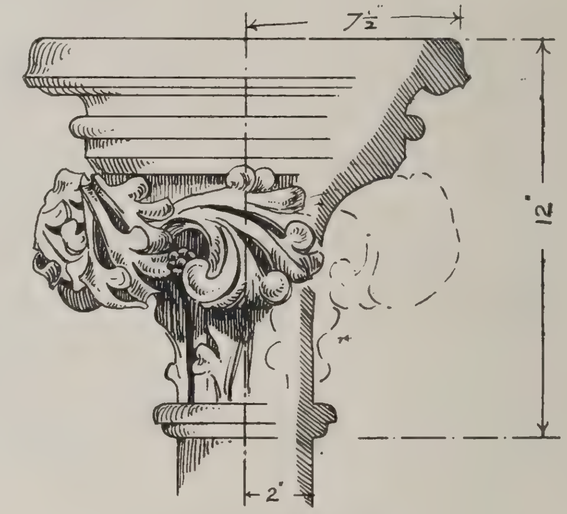
ANSWERS TO QUESTION 4.



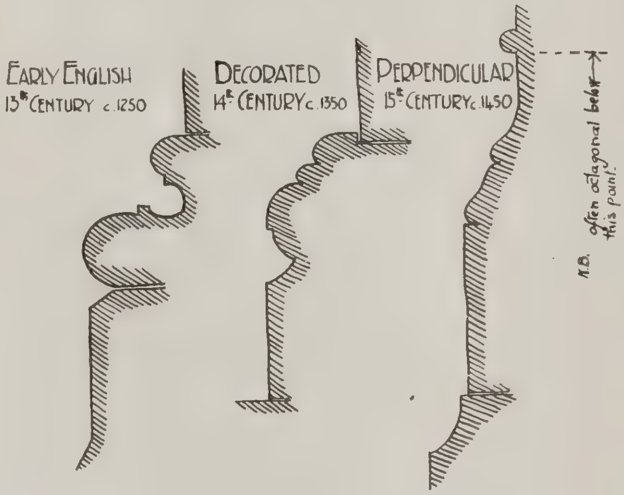
Answer to Question 1.



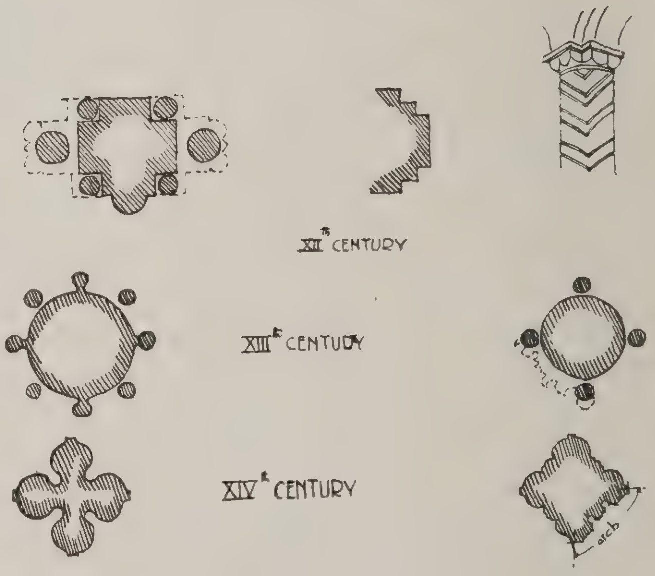
Answer to Question 2 (1).



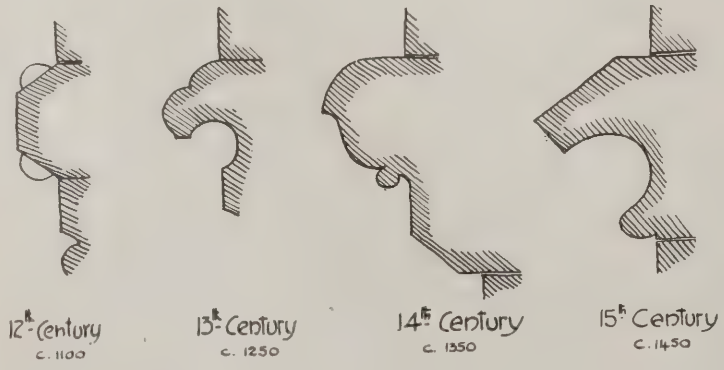
Answer to Question 2 (2).



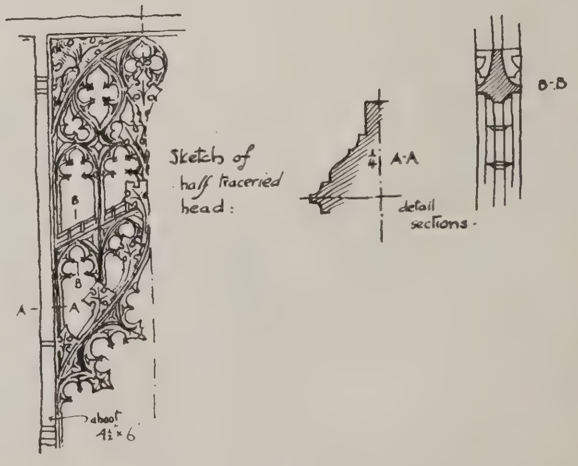
Answer to Question 3.



Answer to Question 4.



Answer to Question 5.



Answer to Question 6.

R.I.B.A. INTERMEDIATE EXAMINATION: SUBJECT II.

In all cases the arch mouldings and piers are separated by capitals and generally the arch overhangs the face of the piers very considerably.

In the fourteenth century the equilateral nave arch was the most common form; in this century some of the arch mouldings were often continued down the pier without being stopped by the capitals; the mouldings are larger but less undercut and are divisible into orders.

The piers are arranged diagonally and the shafts are almost always attached and are often filletted; in the smaller churches octagonal piers are common in this period. Horizontal bands are not used.

The ogee moulding is common and the hollows are often enriched with four-leaved or ball flowers.

5. *Draw, full-size, at least four different sections of hood moulding to stone arches, illustrating variation in the profile of this member from the twelfth to the fifteenth century, and assign approximately to each example an appropriate date.*

See sketches.

6. *A fifteenth-century oak screen is framed into open upper panels, having heads of pierced tracery, moulded and cusped.*

Illustrate one of these heads by a sketch and give to full-size the moulding of one of the main uprights of the screen comprising the tracery-bar and its cusping.

See sketch.

R.A. ARCHITECTURAL SCHOOL.

From October 1st next the Architectural School of the Royal Academy will be open five evenings in the week (Monday, Tuesday, Wednesday, Thursday, Friday), from 6 p.m. to 8 p.m., instead of three as now. Applicants for admission to the school who can produce a certificate of fair proficiency from an institution for architectural education recognised by the Royal Academy will be exempt from the necessity of showing the work required for the admission of probationers. These institutions are:—The Royal College of Art; the Architectural Association; King's College, London; University College, London; Liverpool University; and Manchester University. The list may be added to at the discretion of the president and council. The first date for the admission of probationers under this new system will be Tuesday, July 31st. The certificates, together with the printed form to be previously obtained from the Royal Academy and duly filled in, and the certificate of birth, must be delivered at the Royal Academy on Saturday, July 28th. The examination of the successful applicants for admission as students will be held in October. Any further information can be obtained on application at the Royal Academy, Burlington House, Piccadilly, W.

Obituary.

Mr. W. J. Grant, F.R.I.B.A., of Hastings, died last week, aged 83.

Mr. John Wills, senior partner in the firm of Messrs. John Wills & Sons, architects of Derby and London, died recently. He carried out a great deal of nonconformist church work.

Mr. J. H. Christian, late architect to the Ecclesiastical Commissioners, died in London last week, aged 74. He was the younger brother of the late Mr. Ewan Christian.

Correspondence.

Finchley Cottage Hospital.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Your interesting article on the above inspires me to ask reasons for some of your remarks, as from one seeking instruction who has not seen the exhibited plans. From your rough sketches it would appear that in plan No. 1100—which you extol—all traffic to the future ward would be through the isolation block. Is not this a startling innovation in hospital planning? What is there in the verandahs on the northern side that calls for special commendation on your part, or what in the extreme length of corridor and varying distances from the administrative centre to the several blocks? Your favourable comments re future extension—symmetry, orientation, light and air to wards, convenient placing of administrative department—appear to be equally, if not more, applicable to plan No. 1101. Your kind enlightenment on these points would be gratefully received by, perhaps, others of your readers besides myself.—Yours truly,

ROGER F. BACON, A.R.I.B.A.
LONDON.

[Isolation wards should have no place in a cottage hospital, for infectious cases should be at once removed to an infectious diseases hospital. The wards were marked as isolation upon the competition drawings in compliance with the conditions, but it was the author's intention that they should be used as rooms for paying patients, and this was stated by them in their report. The objection to the access to the future extension is thus removed. As regards the distance of the future extension from the administrative block, this is really not great, especially when compared with similar distances in large hospitals. We are not aware that we specially praised the northern verandahs, or did more than merely mention their existence. It is, unfortunately, difficult to go into further details of the scheme until it is possible to publish the plans themselves. There may be points for criticism in the design in question, but even so, the scheme as a whole, appeared to us to possess greater merits than any of the others which were submitted.—ED. B. J.]

Pecksniff's Defence.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—May I crave a portion of your valuable space to protest against Mr. Sampson's sneers at my immortal relative, the late Mr. Pecksniff. Since a novelist, whose works have ever been dear to the intellect of the middle-classes, held him up to scorn, he has suffered much unmerited obloquy, and such is the force of unreasoning prejudice that I do not recollect a voice being raised in his defence. Is it not a little pathetic to find Mr. Sampson and Mr. Bonner trotting out the hoary fallacy that an architect should of necessity make his own designs? Truly the illusions of youth die hard with some. Do we ask an engineer if his designs are his own, or insist that our accountant personally audits our books? Do we complain if our lawyer admits employing a conveyancer? Are we shocked to find that the successful patentee is rarely an original inventor? An architect is instructed to produce designs for a building suited to a given purpose, and his success is in proportion to their merit. His clients neither ask for nor desire any guarantee that they are the product of his own brains. Why, then, is he immoral if he realises that he can buy or organize better ones than he can himself produce? Mr. Sampson refers to a practitioner, now, alas, deceased, who carried out with great success the principles of my illustrious relative, and he adds he was very successful in his competitions. This tempts one to ask why, if the men who assisted him could have been equally successful without him, they did not embrace the opportunity? The conclusion is forced on one that there was more in this emulation of Pecksniff than they grasped. Do Mr. Sampson and Mr. Bonner really think the glorious genius of the Pecksniffs will be stifled by registration, by a close profession however enacted; or that assessors, however chosen, have any terror for them? No, modern conditions demand skilled organisers, and despite envious depreciation, the Pecksniffs have ever been expert organisers.—Yours truly,

PECKSNIFF MINOR.

Notes and News

The North Transept of Hexham Abbey, which was in a dangerous condition, has been put into a state of thorough repair at an expenditure of nearly £2,000. The present stables, &c., abutting the west wall of the ancient church are to be removed.

A Cottage Hospital at Ramsey is in course of construction from designs by Messrs. Henman & Cooper, of Birmingham. The cost of the building will be about £6,000, and the contractors are Messrs. Callow & Sons, of Ramsey.

St. Muredach's New Diocesan College, Ballina, is approaching completion. The plan embraces a central block and two wings, giving a total frontage of 144ft. The total expenditure will be £16,000. The architect is Mr. W. H. Byrne, of Dublin, and the contractors Messrs. McKee and McNally.

The New High-Level Railway Bridge at Newcastle-on-Tyne, constructed by the Cleveland Bridge & Engineering Co., Ltd., of Darlington, to the designs of Mr. C. A. Harrison, chief engineer of the northern division of the North-Eastern Railway, was opened by His Majesty the King yesterday. The contract ranks as the largest of its kind in this country since the completion of the Forth Bridge. The design comprises four spans of steelwork supported on piers of granite.

University College (London) Architectural School.—At the prize distribution last week the Donaldson silver medals for general excellence were awarded to H. B. T. Morgan and B. M. Goodwin. The college diploma, which exempts from R.I.B.A. intermediate examinations, was, on the recommendation of Mr. John Slater, B.A., awarded to H. B. T. Morgan, B. M. Goodwin, and F. A. Richards. In the evening school, held under a grant from the Worshipful Company of Carpenters, prizes were awarded as follows:—Design Class: *1st Prize,* H. A. Welch; *2nd Prize,* R. S. Bowers; *Hon. Mention,* G. B. Bridgeman, H. B. T. Morgan, T. J. Wills. Elementary Design Class: *1st Prize,* R. J. Hunt; *2nd Prize,* R. Cromie.

THE TIMBER TRADE.

London Market in June.

A SMALL business at improving prices about sums up the record of the timber market for London in June, and perhaps applies with sufficient accuracy to that of the country generally, and to the negotiations for further supplies from the exporting countries also. The deliveries from the docks in June in London have been 600 standards less, and overside 3,600 standards less than in June last year. For the first half of this year they have been 8,400 standards less from the docks and 2,500 standards less overside than for the same period of 1905. Messrs. Churchill & Sim state that while this continues to be the case it is impossible to feel that the situation is entirely healthy, but, in spite of it, prices here and everywhere else have been improving all the time and the general trade of this country has been improving also. If and when an improvement does occur in the demand for wood, it will come upon markets very sensitive to any such influence and dominated by many causes pointing to difficulties of supply from many quarters.

Messrs. Denny, Mott & Dickson, Ltd., report on Baltic and White Sea goods as follows:—

"Contrary to general expectations, the better tone prevailing in May did not extend to June, which month has been characterized by dull trade. Prices, however, have been maintained; but it is becoming increasingly difficult to hold to the advance established in May. The slackness of trade has effectively checked speculation. Transactions therefore are necessarily small, and calculated to cover immediate requirements only. It is already evident that it will require something more than mere rumour as to a prospective shortage if the remaining half of the year is to compensate holders for the poor consumption of the past six months."

The abstract of dock stock, consumption, &c., for June, published by Messrs. Foy, Morgan & Co., is given in the table at the foot of this page.

Dock Stock.

The stock of wood in the public docks on June 30th was:—

	Pieces.
Foreign deals and ends - - -	782,000
Do. battens - - - -	1,129,000
Pine deals and battens - - -	541,000
Spruce do do. - - -	439.000
Boards, rough - - - -	2,488,000
Do. prepared - - -	5,241,000

totalling 10,620,000 pieces, as against 13,012,000 in 1905, 15,437,000 in 1904, and 15,657,000 in 1903.

In other kinds the stock was as follows:—

Foreign wainscot logs - -	409 pieces.
Do. oak timber - -	497 loads.
Do. fir timber - -	2,131 do.
Do. Oregon pine, &c., spars and masts - -	4,310 do.
Colonial oak timber - -	935 loads.
Do. birch timber and planks -	3,676 do.
Do. elm and ash timber -	605 do.
Do. yellow pine - -	307 do.
Do. red pine - - -	32 do.
United States pitch-pine timber	16,889 do.
Do do. deals -	11,000 pieces.
East India teak - - -	7,885 loads.

Deliveries.

The deliveries have been—

	First six months. Pieces.	June. Pieces.
Foreign deals and ends -	1,572,000	194,000
Do. battens - -	2,626,000	330,000
Pine deals and battens -	526,000	82,000
Spruce do. do. -	594,000	91,000
Boards, rough - -	2,558,000	295,000
Do. prepared - -	6,847,000	1,052,000
Total - -	14,723,000	2,044,000

The deliveries from ship to craft have been—

	First six months. P.s.h.	June. P.s.h.
Deals and battens - -	31,662	14,037
Boards - - --	9,214	3,706
Total - -	40,876	17,743

Soft Woods.

Swedish Deals and Battens.—The supply of deals has been normal and prices unchanged. Of battens there has been a deficient supply and rates were perhaps 5s. per standard higher than in May. Of prepared boards the new supply has been a good deal smaller than usual, and for these the demand has been sufficiently active to affect prices favourably throughout the month. Swedish shippers have raised their prices for summer and autumn shipment for flooring and all battens and scantlings during the month and have effected a fair amount of business on the new terms.

Norwegian Boards.—The supply of flooring boards from the Norwegian ports has been a fairly large one, bringing the dock stock up to rather more respectable dimensions. The demand has been satisfactory throughout the month and prices have advanced steadily, the market being supported by the rise in quotations for the autumn shipments from Sweden.

Russian Deals.—The arrivals so far have been small and have consisted chiefly of deals with a much smaller proportion even than usual of battens and scantling. Prices in London have been maintained at recent levels. Shippers have been greatly troubled with labour difficulties, but have overcome them with some measure of success, and shipments are now taking place with fair regularity. For the lower qualities of deals for autumn shipment, quotations have declined some 5s. per standard below those obtained for the open-water exportations.

Finnish Scantlings.—The fresh importations of scantlings to London continue on a very small scale, and the market all round is very firm. At the Finnish ports also the labour difficulties in connection with the open-water shipments have been very great, although the conditions prevailing in this respect at the end of the past month showed a sensible improvement.

Prussian Timber.—The fresh supply of fir timber has been quite small, but even so the stock is accumulating to something like normal proportions, and quotations are weak.

Canadian Timber.—The demand for pine deals has continued at the slow rate which has now been normal for some years past, and quotations are unchanged. The markets in Canada are as firm as possible and must evidently continue so throughout the season. Of spruce deals the arrivals have, up to the present, been quite abnormally small, and this state of things seems so likely to continue that, in spite of a ragged demand, the market improved in June and prices are definitely higher.

Hard Woods.

Teak.—Messrs. Denny, Mott & Dickson report that the landings in the docks in London during June consisted of 639 loads of logs and 178 loads of planks and scantlings, or a total of 817 loads, as against 868 loads for the corresponding month of last year. The deliveries into consumption were 695 loads of logs and 230 loads of planks and scantlings—together 925 loads, as against 885 loads for June, 1905. The stock remains practically on a level with that of a year ago.

The imports during the first half of the year amounted to 5,201 loads, against which there has been a consumption of 4,315 loads. These figures are exclusive of the imports of logs and conversions from Java, of which the high rates for Burmah and Siam wood have encouraged an increased importation. The landings of 1,767 loads during the past half-year compare with 545 loads landed for the corresponding six months of 1905; but the consumption has not grown in proportion, being only 1,262 loads as against 1,054 loads for the same period. The want of length and the inferiority of conversion are largely responsible for the difficulty in selling this production.

Messrs. C. Leary & Co. give the following quotations according to specification:—Timber, £12 10s. to £19; flitches, £16 to £20; planks, £13 10s. to £19 10s. per load, on c.i.f. terms.

Mahogany.—This market has been a restricted one all through the half-year, owing to very modest imports. Prices, however, have varied but little, owing to the equally modest consumption. These conditions have served to make a safe, but at the same time very dull market, and so far as forward supplies can be gauged, it seems likely that the rest of the year will see no startling fluctuation in prices, although they should tend upwards, even if the present rate of consumption should continue.

Walnut.—In American black, prime sizeable logs sell readily, but the demand for Italian and French is very quiet.

Abstract of Stock, Consumption, &c., in London Docks, for June.

SELECTED DESIGN. PERCY ROBINSON and W. ALBAN JONES, JOINT ARCHITECTS.

Notes on Competitions

Norwich Shirehouse.

Should the successful competitor have been disqualified? It is perhaps somewhat late in the day to raise such a question, the working drawings having been completed and a contractor's estimate provisionally accepted; but the recent published announcement of the latter fact having awakened bitter memories and provoked an outburst of correspondence upon a somewhat contentious point, the subject would appear to merit consideration at this stage in spite of the reticence we always feel about commenting upon an award that has been confirmed and the architect duly appointed to carry out his scheme. In our issue of January 17th last we commented upon the discrepancy between the architect's estimate for his scheme submitted in competition and placed first by the assessor, and the assessor's estimate. The figures were £8,850 and £13,820 respectively. The original conditions required that each competitor should forward with his designs a tender from a reliable contractor, undertaking to carry out the works specified. What we did not know then, but what we have learned since, was, that this clause had been modified, no doubt in consequence of protests which had been made, so that a contractor's estimate was not required, but only a bona-fide one from the architect himself. The estimate of £8,850, therefore, was the bona-fide estimate of the author of the design placed first. The estimate of the author of the design placed second amounted to £13,210 and the assessor's estimate for this scheme was £13,640. Here is the bone of contention—the discrepancy between the estimates for the respective schemes. Assuming that the best design was placed first, ought not the obviously inadequate estimate which accompanied it to have placed it outside the pale of recognition and left the ground clear for an inferior design, but one the cost of which had been accurately stated? The inadequacy of the first amount has been confirmed by the published list of tenders, the lowest of which was £12,240. In considering the case it is very important to bear in mind that the revised conditions contained no clause that the successful competitor would be disqualified if the contractor's estimate exceeded the architect's by a certain percentage. Moreover, the assessor, by his conscientious computation of the probable cost of each design, was able to place such information before the promoters as would enable them to arrive at a decision without difficulty. It has been argued that they were influenced in their decision by the lowness of the estimate for the design they selected. This is hardly probable in view of the assessor's figures, which are not likely to have been ignored. One can imagine the deliberations of the assessing committee resolving themselves in some such consideration as this:—"Here is a design which our architect adviser has placed first in order of merit and which he considers can be erected for a sum which appears to be an average one for the building we require. True that the author of the design has seriously under-estimated the cost, but are we on that account to reject it and accept an inferior design which will cost us, if erected, an approximately identical amount?" If this can be accepted as a reasonable hypothesis, and if it be weighed up with the fact of the absence of a penalizing clause as to cost, then surely the deduction must be that the committee acted, through their selection of the design placed first by the assessor, in the best interests of themselves, those they represent, and, we venture to think, the competitors themselves. The ground is further cleared by reason of there being no limit of cost in the conditions. Had a sum been stated, the issue would have been a very different one. Again, could it be shown that the successful competitor was actuated by the intention of deceiving the promoters in the matter of cost, the case would present another aspect, but as there are few architects who are able to say that they have never made a mistake in estimating, and as the danger of doing so is especially great in matters of this kind, particularly with young competitors, it is only fair to take a charitable view of the case, and at the very least give the fortunate competitor the benefit of the doubt. This question of estimated cost is always a difficult one, for competitors are notorious for taking the most sanguine view of the amount for which their schemes can be carried out. They are influenced by the double desire of producing a fine building at a low cost, and are apt to overlook the current rates of labour and materials, and that their dados and floors are of marble, where in a former instance cement and wood had to serve the purpose. Where a limit of cost is put upon the building the question is one which, of course, should affect the award most materially, for any laxity in the consideration of the estimates by the assessor must act to the detriment of the competitor who has struggled to produce a building within the stated amount. Where there is no limit the case is a different one, and where, as in the present case, the three premiated designs are all valued by the assessor at sums within a few hundred pounds of one another, there cannot be much wrong in the best design being selected.

Dublin Technical Schools.

The question of the architect for the new technical schools to be built in Bolton Street, Dublin, came up for discussion again at the last meeting of the Dublin Municipal Council. A request was brought forward by the Technical Education Committee that competitive designs should be invited for the building, but this was rejected, and the decision come to that the city architect should be given the work. Alderman Irwin protested against "£2,000 of public money being expended upon an outside architect, while the corporation had in their employment an architect as competent as any one that they could select. The question of the architect was not the most important; the real question was, when was the work to be begun?"

Free Library, Caversham.

The first premium (£20) in this competition has been awarded to Mr. W. G. Lewton, and the second (£10) to Mr. W. G. A. Hambling, both of Reading. The building is to cost £1,600.

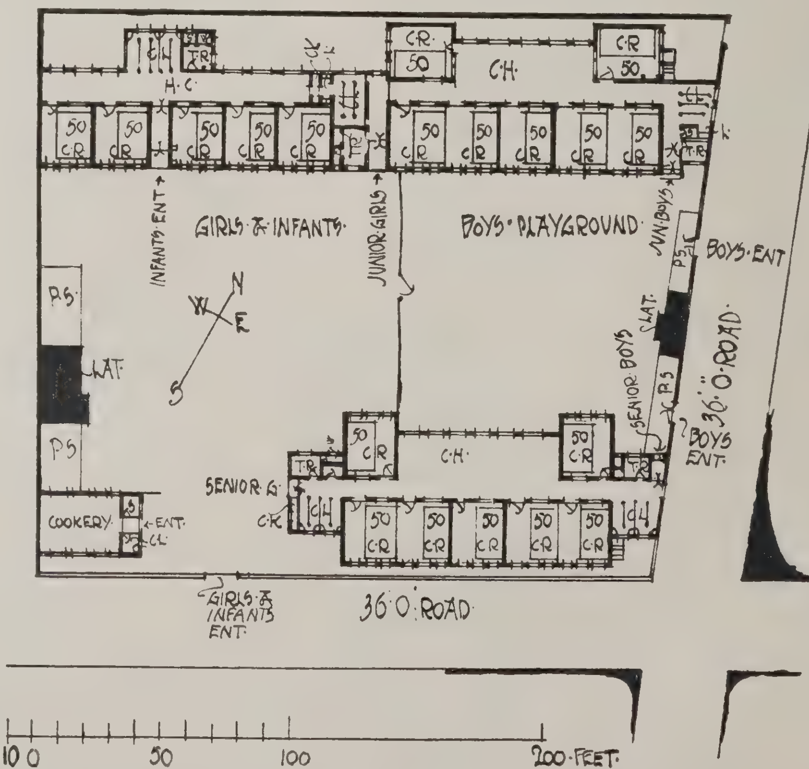
Holborn Borough Offices.

From the designs submitted by the six invited architects in this competition the Establishment Committee of the Holborn Borough Council have chosen design No. 1 for the proposed new offices for the borough, and will recommend that design to the council. It is estimated to cost £19,205.

Durham County Schools, Southmoor.

In the competition for these schools, held by the Durham County Education Committee, forty-one designs have been submitted.

The accommodation is for 350 senior mixed, 350 junior mixed, and 250 infants, each in separate departments, with a cookery classroom for 36 at demonstration and 18 at practice. The cost had not to exceed



C.R.—Classroom. C. H.—Central Hall. H.C.—Hall Corridor. CL.—Cloaks. CK.—Caretaker. T.R.—Teachers' Room. S.—Store. W.—Closet. P.S.—Playshed.

DURHAM COUNTY SCHOOLS, SOUTHMOOR. PLAN OF SELECTED DESIGN. CLARK & MOSCROP, ARCHITECTS.

£10 per head, with an extra allowance of 15s. per ft. super. for central halls, marching corridor and cookery room.

The authors of the first-premiated design are Messrs. Clark and Moscrop, architects, of Darlington, whose alternative set is also placed second; the third-premiated design being by Messrs. Liddle & Brown, of Newcastle-on-Tyne. The selected design shows classrooms divided for fifty scholars. The senior mixed block is the best of the three, because here the authors have not been handicapped in arranging the entrances by the width of the site, as they have in the other departments. The lavatory accommodation is poor, and the teachers' room has only partial inspection of the boys' playground. If there is much traffic on the adjoining roads it will cause a serious annoyance.

The details of the entrances in the junior mixed school, and especially in the infants' school, are not commendable. Indeed, in the last the effort to obtain south light is painful; and the hall-corridor is unnecessarily long and its area in excess of all requirements. The elevations are treated simply with Elizabethan gables. The estimated cost is £10,425, the main building cubing at 5½d. and the latrines at 3d.

Broadly, the second-premiated design is a repetition of the first, and whilst it contains improvements in several details it loses advantages in others. The elevations are differently treated.

The third-premiated is a good scheme; as also are several others not placed.

Some competitors have allowed for future extensions, and have indicated the same upon their plans. The selected design shows none. Three weeks before the stipulated time when designs had to be delivered, a circular was issued stating that the committee would give preference to designs capable of easy extension. And those architects who took this intimation seriously have made laborious attempts to meet it and necessarily sacrificed their designs in other ways. It must be a source of disappointment and dissatisfaction to such competitors, because, in the end, future extensions do not seem to be at all required.

The committee did not appoint an assessor, and, as previous remarks in this journal implied, representations for the appointment of an assessor were made. But with no result. And though it was locally understood that the committee would be guided in their selection by the advice of their own architect (Mr. W. Rushforth, F.R.I.B.A.), the clause that "the committee will select the plans which, in their judgment, will best meet their needs, and their decision shall be final and binding on all competitors," cannot by any means be called a satisfactory one.

We are informed that in the report on the designs which Mr. Rushforth drew up for the Education Committee one of the designs of Messrs. Clark and Moscrop was placed fourth in order of merit, whilst the other was not mentioned at all; and that of Messrs. Liddle & Brown was placed fifth. The sub-committee, consisting of four members, ignored Mr. Rushforth's report and selected the designs they themselves preferred.

Grenoside Parsonage.

A new parsonage house at Grenoside is to be erected. Seven architects submitted designs, and Messrs. R. & W. Dixon, of Barnsley, were the successful competitors. The contractor is Mr. C. W. Squire.

Hove Library.

We publish in this issue the selected design in the competition for the new public library to be built at Hove, the successful architects being Messrs. Percy Robinson and W. Alban Jones, of 53, Albion Street, Leeds. It will be recollected that this is the second competition for the building, the first having been unsatisfactory, Mr. Belcher, the assessor, not being able to recommend the adoption of any of the seventy-one designs submitted. In the second competition ten architects in the first were invited to send designs. Considerable restriction was imposed by reason of the requirement of a local by-law that there should be an air-space of at least 25ft. in the rear. The first-premiated design is estimated to cost £9,333. There is no necessity for any detailed description of the arrangement, as the plans clearly show this. The second premium (£30) has been awarded to Messrs. A. J. Hardwick and Sydney E. Castle, of Eagle Chambers, Kingston-on-Thames, and the third premium (£20) to Mr. Lionel U. Grace, of 30, John Street, Bedford Row, W.C.

Bangor College Buildings.

At last week's meeting of the Carnarvonshire County Council a wrangle took place in connection with the following resolution of the Council of the University College of North Wales, Bangor:—"That the Council, while thanking the Carnarvonshire County Council for its resolution in support of the application of the Welsh University Colleges for increased Treasury grants, desires to express its surprise and regret that a further resolution should have been adopted reflecting upon the action of the College in connection with the selection of architects for the new buildings. The statement that the conditions of the competition were such as to debar Welshmen from submitting designs is entirely without foundation. They regret that the County Council should have endorsed it without satisfying itself as to its accuracy by enquiry from official sources."

Henshaw's Asylum, Manchester.

In connection with the competition among Manchester architects for the proposed rebuilding of Henshaw's Blind Asylum at Old Trafford (for which Mr. John Holden, F.R.I.B.A., of Manchester, is the assessor) we notice several letters in the *Manchester Guardian.* A correspondent signing himself "Ratepayer" says: "Every architect, when applying for the printed instructions, must pay a deposit of a guinea. This is a condition which only puts the committee to unneccessary trouble, as all architects, who in this case are limited to those practising in Manchester, are known by name and their addresses can be verified by reference to the directory if necessary. The Preston Corporation recently organised a most successful competition for large schools, and issued instructions without asking for any deposit, thus saving both themselves and competitors considerable trouble. Nothing is gained by the condition; it is merely an old custom for which there is no reason, as the printed competition instructions need not be sent to anyone not actually practising within a specified district. The Manchester and Liverpool Corporations both adhere to the antiquated system. No reason can be suggested why they should not follow the lead of Preston."

"Architect" writes:—"Competing architects will no doubt be glad that the Board have taken the very proper step of appointing an assessor and of publishing his name; but I would suggest that it would have been far better to have appointed some architect not practising in the neighbourhood to decide on the merits of schemes submitted by local architects. . . "

"F.R.I.B.A." writes:—"Contractors and traders are usually asked to deposit an amount, to be returned on receipt of a tender, for the particulars necessary to enable them to estimate, because proprietors find that they have many more applications for particulars than they receive tenders. . . . But in the case of architects, to charge them for particulars of a competition is positively ludicrous when one considers that the designs they send in often cost them a hundredfold the cost which promoters incur upon premiums, advertising, and printing put together. Most architects who ask for particulars mean business if they find the particulars fair and reasonable. It would be going quite far enough if architects of recognised professional standing were furnished with particulars gratuitously, with a request that if they should decide not to compete they would return the instructions furnished within fourteen days of their receipt. Promoters themselves would gain by abandoning the present practice, because they would induce many designers seriously to consider their competitions who will not risk the possibility of being asked to pay for something which may contain conditions so utterly impracticable or unjust that they would feel justified in declining to use them when obtained."

Carnegie Free Library, Annfield Plain.

Thirteen designs have been submitted in competition for this building, and the design of Mr. Edward Cratney, of Rose Hill, Willington-on-Tyne, has been accepted.

Baths, Fire Station and Library at Reddish.

Twenty-six designs were submitted in competition for public baths, fire station and library proposed to be erected in Reddish. The assessor, Mr. A. Brumwell Thomas, F.R.I.B.A., of London, has awarded the first premium to design No. 15, by Messrs. A. E. Dixon and C. H. Potter, of 65, King Street, Manchester; the second premium to design No. 2, by Mr. J. Myrtle Smith, of 8, Trafalgar Square, Chelsea; and the third premium to design No. 20, by Messrs. Shewbrooks & Hodges, of 24, Grainger Street West, Newcastle-on-Tyne. Cost was a governing factor in the competition, so that the cubical contents have been kept down as much as possible. The cost of the first-premiated design is put as follows: Baths, £2,784; fire station, £1,160; library, £1,110; total £5,054.

Competitions Open.

The following is a list of competitions open:—

DATE OF DELIVERY	COMPETITION.
July 13	NEW SECONDARY SCHOOL AT MEXBOROUGH, ROTHERHAM. Uncoloured sketch plans for building to cost £8,000 (300 pupils). Limited to architects practising within 35 miles of Mexborough. Names by July 13th to J. W. Hattersley, Secretary to Governors of School, Mexborough.
Sept. 29	REBUILDING OF HENSHAW'S BLIND ASYLUM AT MANCHESTER. Limited to Manchester architects. Premiums £100, £50, and £25. Assessor, Mr. John Holden, F.R.I.B.A.
Oct. 1	ALPHABET COMPETITION. Prizes of £20, £10 and £5. For particulars see "Architectural Review."

Complete List of Contracts Open.

WITH a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

July 12. Lincoln.—*Pulling down and re-building a warehouse* in St. Swithin's Square, Lincoln, for W. K. Merton & Sons, Ltd. Full particulars may be had on application to Scorer & Gamble, architects, Bank Street, Lincoln, on or before July 12.

July 12. Llanerchymedd.—*Additions and alterations* to the Council school, together with new infants' school, out-offices, boundary walls, &c. Plans and specifications may be inspected at the Llanerchymedd Council School, and at the office of J. Owen, F.R.I.B.A., county architect, Menai Bridge. Tenders, endorsed "Llanerchymedd School," (on forms which will be supplied by the architect), to be delivered to R. H. Williams, secretary of education, Education Offices, Llangefni, not later than 10 a.m. on July 12.

July 12. London, S.E.—*Re-pointing and external painting* at Melvin Road School, Penge, S E. The specification may be seen and forms of tender obtained on payment of £1 1s. at the offices of the surveyor to the Committee, H. W. Longdin, Town Hall, Anerley, S.E. Sealed tenders, endorsed "Tender for Re-pointing and Painting Melvin Road School," to be sent to C. Gordon Liddie, clerk to the Committee, the Court House, Anerley, S.E. by noon on July 12.

July 12. Wareham.—*Repairs and alterations* at the Workhouse. Specifications and particulars can be seen at the offices of W. W. Fookes, architect and surveyor, Wareham. Sealed tenders, endorsed "Tenders for Workhouse Repairs," to be sent to E. S. Clark, clerk, Union Offices, Wareham, not later than 10 a.m. on July 12.

July 13. Cork.—*Building and erecting new concert hall and executing sundry alterations to school of music*, Union Quay, Cork, in strict accordance with the specification, conditions and drawings prepared by the City Engineer. General conditions, specification, and drawings can be seen in the City Engineer's Office, Municipal Buildings, from 10 to 4 o'clock daily, where tender forms will be issued. Intending contractors must first lodge with the city treasurer the sum of £2. Tenders on any other forms than those issued from the City Engineer's Office will not be considered. Fair wages clause. Sealed proposals endorsed "Tender for Building Concert Hall, &c., School of Music," must be deposited with F. W. M'Carthy, town clerk, Municipal Buildings, before 2 p.m. on July 13.

July 13. New Mills.—*Erection of a new boardroom* at the Workhouse, New Mills. Bills of quantities can be obtained, and plans and specifications inspected at the office of A. Walker, clerk to the Guardians of the Hayfield Union, Spring Bank, New Mills, to whom tenders must be delivered by July 13.

July 13. Norwich.—*Enlargement of Great Dunham School.* Builders desirous of tendering should send in their names to the Secretary, Norfolk Education Committee, 57, London Street, Norwich, at which office plans and specifications can be inspected and bills of quantities obtained. A deposit of £1 1s. will be required. Tenders must be delivered by noon on July 13, addressed to "The Secretary," at the above address, and endorsed "Tender for Great Dunham School."

July 13. Lochgelly. — *Mason, Joiner, and Plumber Work of Public Convenience* to be erected in Knockhill Close. Specifications may be seen in the hands of the Burgh Surveyor, and Sealed Offers, marked "Public Convenience," are to be lodged with R. Small, town clerk, Burgh Office, Lochgelly, not later than July 13.

July 13. Dunfermline.—*Proposed Latrines*, &c., at Limekilns School, for the Dunfermline Parish School Board. Plans seen and Schedule of Measurements obtained on application to J. Houston, architect and surveyor, St. Margaret Street, Dunfermline, with whom sealed offers are to be lodged not later than July 13, by 10 a.m.

July 14. Blackpool.—*For the whole of the work in the erection of a lecture hall* at Claremont Congregational Church, Blackpool; also separate tenders for the various trades. Bills of quantities and other particulars may be obtained and plans inspected at the offices of the joint architects, Walter Wade, Bank Chambers, St. Anne's-on-Sea, and William Fielding, 12, Birley Street, Blackpool. Tenders, sealed, and endorsed "Tender for New Lecture Hall," must be addressed to the chairman, Rev. A. H. Boyden, B.A., B.Sc., 22, Clevedon Road, Blackpool, and delivered not later than July 14.

July 14. Manchester.—*Erection of a manager's house* at the Withington Sewage Works, Chorlton-cum-Hardy. Drawings may be inspected and bills of quantities and tender forms may be obtained on application to the secretary of the Rivers Department, Town Hall, Manchester. Tenders must be enclosed in the official envelope provided expressly for the purpose (otherwise the tender will not be considered), and delivered at the above office not later than 10 a.m. on July 14.

July 14. Scilly Banks.—*Erection and completion of two dwelling-houses* at Scilly Banks. Plans and specifications can be seen at the Lowther Arms Inn, Scilly Banks, near Whitehaven. Separate Tenders will be received up to July 14 by W. Carmichael, architect, Parton, near Whitehaven.

July 14. Wakefield.—*For the following works* for the West Riding Education Committee:—Erection of new school at Thorpe, Rothwell (builder, joiner, slater, plumber, plasterer, painter). Erection of new school at Bailiff Bridge, Hipperholme (builder, joiner. slater, plumber, plasterer, painter, concretor). Bilbrough Provided School—alterations (builder, joiner. plumber, plasterer, painter). Plans may be seen and quantities obtained on application to the County Hall. A deposit of £1 is required for each of the two first mentioned. Cheques to be sent to the West Riding Treasurer, County Hall, Wakefield. Sealed tenders, properly endorsed, to be sent to J. Vickers-Edwards, county architect, County Hall, Wakefield, not later than 10.30 a.m. on July 14.

July 16. Alfreton.—*School for 400 infants at Alfreton.* Tenders to be delivered not later than July 16. Quantities will be supplied on application to Percy B. Houfton, architect, Chesterfield.

July 16. Beckenham.—*Erection of extensions* to and the modernisation of the existing boys', girls' and infants' departments of the public elementary schools, Bromley Road, Beckenham, for the U.D.C. Drawings may be seen and bills of quantities, and forms of tender obtained on application to John A. Angell, surveyor, on the production of a receipt from the collector (who attends his office daily from 9 to 10 only, except on Tuesdays, when his hours are from 9 to 1) for a deposit of £5. Fair wages clause. Tenders, duly sealed and endorsed "Tenders for Bromley Road Schools," to reach F. Stevens, clerk of the Council, Beckenham, not later than 4 p.m. on July 16.

July 16. Cleckheaton.—*Mill, &c.* For the various works required in erection of a four-story mill and offices at Prospect Mill, Cleckheaton, for Critchley, Sharp & Tetlow. Plans may be seen and bills of quantities obtained at the offices of Howorth & Howorth, architects, surveyors, &c., Old Bank Chambers, Cleckheaton, up to July 16. Sealed and endorsed tenders to be sent to the Architects by noon on July 16.

July 16. Denmead.—*Additional window to class-room, ventilation, external and internal repairs, and internal painting* to the school. Persons desirous of tendering may see plans and conditions of contract and obtain specification at the office of W. J. Taylor, county surveyor, The Castle, Winchester, between 9 a.m. and 5 p.m. (Saturdays, 9 a.m. and 1 p m.) Plans and conditions of contract may also be seen at the School. A deposit of £1 1s. will be required for a copy of the specification. Deposits must be made by cheque, payable to Hants County Council, and crossed Bank of England, or particulars will not be sent. Tenders, endorsed "Proposed Work, Denmead Council School," are to be delivered to H. Barber, Clerk to the County Council, The Castle, Winchester, by 10 a.m. on Julv 16.

July 16. Greenock.—*Structural and other work* required for the installation of a Refuse Destructor and Electric Generating works required to be erected on the site known as No. 2, Millstead Dwelling, Burn Square, Greenock, for the Electricity Dept. The work is divided as follows:—Specification 26, Buildings, &c., Contract (*a*), Excavator, Brick and Mason's Work; Contract (*b*), Carpenter's Work and Roof Glazing; Contract (*c*), Structural Steel Work; Contract (*d*), Slater's Work; Contract (*e*), Tile Work. Specifications, schedules and forms of tender can be obtained on application to J. A. Robinson, Brush Electrical Engineer, on payment of a deposit of 5s. for each specification. The drawings may be inspected at the office of the department between 9 a.m. and 12.30 p.m. Tenders enclosed in a sealed envelope clearly marked with the number of the Contracts being tendered for, to be lodged with Colin MacCulloch, town clerk, Municipal Buildings, Greenock, not later than 10 a.m. on July 16.

July 16. London, W.—*Erection of new school*, Drayton Green, West Ealing. The drawings and specification may be seen, and forms of tender, together with bills of quantities and other particulars, may be obtained from Charles Jones, M.I.C.E., borough engineer, Town Hall, Ealing, W., any day during office hours, upon payment of a deposit of £5 5s. Sealed tenders, in the envelopes provided, endorsed "Tender for New School, Drayton Green," must be delivered at the office of J. B. Johnson, secretary, Education Office, Town Hall, Ealing, W., not later than noon on July 16.

July 16. Southampton.—*Erection of cook's bedroom* at the Union Workhouse, West-end, Southampton, in accordance with the plan, specification, and conditions of contract prepared by W. H. Mitchell, Son and Gutteridge, architects, of 9, Portland Street, Southampton. The plans, &c,, may now be seen, and all particulars obtained at the offices of the architects. Sealed tenders, on the form provided, are to be sent to E. T. Westlake, 20, Portland Street, Southampton, not later than 12 noon on July 16, endorsed "Tender for Cook's Bedroom."

The Specification of the work can be inspected at the Buildings daily between the hours of 10 and 5. Sealed tenders, endorsed "Painting &c.," are to be delivered at the Sessions House, Maidstone, addressed to C. Turner, clerk, Sessions House, Maidstone, not later than 10 o'clock on July 24.

July 25. Whittingham County Asylum, Preston.—*Outside painting.* Tenders are invited for labour and plant only, and a separate one for the materials, paints, oils, varnishes, &c., for same. Specifications, with forms of tender, may be obtained from Thomas Dilworth, clerk and steward, at the asylum. Tenders to be in on or before July 25, at 10 o'clock in the morning.

July 28. Castleknock.—*Plumbing works* required to be done at the new residence for the medical officer at Castleknock, in accordance with the specification and plans, which can be seen and copied at Boardroom, North Brunswick Street, Dublin. Any further information can be had from Mr. Morris, clerk of works. Fair wages clause. Sealed tenders (with wax) will be received in the tender box at the Boardroom up to noon on July 18.

No date. London, E.—*Execution of whitewashing, painting, &c.*, at the Lunatic Wards on the Workhouse Premises in Bancroft Road, E. Forms of tenders and full particulars relating to the work can be had upon application at the offices of J. M. Knight, architect, 35, Bancroft Road, Mile End, E. Fair wages clause.

No date. London, N.E.—*Painting works* at the Guardians Offices, 53, Clerkenwell Road, E.C. Copy of the specifications and form of tender may be obtained from J. Allan Battersby, Clerk to the Guardians, 57 Clerkenwell Road.

ROADS AND CARTAGE.

July 12. Newhaven.—*Supply of about 300 tons of 2-inch broken Kentish rag stone* for the Rural District Council to be delivered in quantities as required at Falmer, Kemp Town, Lewes, and Newhaven Stations: Also tenders for scarifying and rolling the roads in the Council's district, such rolling, etc., to be commenced not later than the first week of November next. The contractor will be required to provide the necessary labour, fuel, etc., to complete the work. Tenders for the rag stone, together with samples, as also tenders for scarifying, etc., to be forwarded to H. W. Coupe, clerk to the Council, Union Offices, Workhouse, Newhaven, not later than July 12.

July 13. Castleford.—*Asphalting of the playgrounds* at Glass Houghton Provided School, Castleford. Specifications may be had from B. Leah, Divisional clerk, Castleford, to whom sealed Tenders must be sent before July 13.

July 13. Reigate.—*Supply of the following materials:—Granite macadam, granite kerb, granite setts, Kent ragstone, tar paving, flints, gravel, concrete, beach, Portland cement.* Specifications may be seen and forms of tender obtained upon application to Fred T. Clayton, the Borough surveyor, ; and every person tendering will be required to deposit at his office at the Municipal Buildings, Reigate, a sample of the materials for which he tenders. Sealed tenders, endorsed "Tender for Granite," or as the case may be, are to be delivered to A. Smith, Municipal Buildings, Reigate, on or before noon, on July 13.

July 14. Dorking.—*Supply of English granite* for roadmaking, broken to 1½-inch gauge, delivered free on rail at Dorking when required during October and November next, for the U.D.C. Sealed tenders, marked outside "Granite," with samples and particulars as to quality, to be sent to W. J. Hodges, 64, Stone Street, on or before July 14.

July 14. Durham.—*Paving* in granite setts the roadway of Framwellgate Bridge in the City of Durham. Quantities and forms of tender can be obtained and plans, specifications and conditions, of contract seen at the County Surveyor's Office, Shire Hall, Durham, where tenders are to be delivered not later than July 14.

July 16. Camberwell.—*Kerbing, channelling, foundations for asphalt paving and roadwork*, in the following new streets:—Eynella Road and Turney Road (part of), Dulwich. Specifications and forms of tender can be obtained from W. Oxtoby, borough engineer; and tenders must be delivered on or before July 16 not later than 6.30 p.m., addressed to the Works and General Purposes Committee.

July 16. Workington.—*Formation of Park Lane within the borough.* Plans and specifications may be seen at the borough surveyor's office. Tenders to be sent to J. Warwick, town clerk, Town Hall, Workington, not later than July 16.

July 17. Dartford.—*Making-up of Junction Road North, Priory Hill, Anne of Cleves Road, and Priory Road, Dartford*, in accordance with the plans and specifications, which may be seen and quantities obtained, upon applying at the office of the Surveyor, T. E. Tiffin, Council Offices, Dartford. A deposit of £2 2s. must be paid for the quantities. Tenders, endorsed "Tender for Private Street Works," must be delivered to W. Kay, Clerk to the U.D.C., Dartford, not later than July 17.

July 17. Leeds.—*Paving and Flagging* of the following streets: Harold Grove, Back Harold Grove, Raincliffe Grove, Temple View Terrace; Raincliffe Street, Chantrell Place, Everleigh Street, Everleigh Place, Everleigh Grove and Chantrell Grove. Drawings may be seen at the city engineer's Office, Municipal Buildings. Forms of Tender and Bills of Quantities may be obtained, and copies of the documents forming the contract inspected, on application at the Highways Office, 155, Kirkstall Road. Sealed tenders, endorsed "Tender for Private Street Works," and addressed to the Highways Committee, must be delivered at the Town Clerk's Office, Town Hall, Leeds, not later than 10 a.m. on July 17.

July 17. London, E.C.—*Repair and maintenance of all works of stone paving in the carriageways and footways* of the City as may from time to time be required during periods of One, Two or Three years, commencing from Michaelmas Day next, upon the terms and conditions contained in specification which may be obtained at the office of the City Engineer on payment of £2 2s. Persons tendering must give the names and addresses of at least two substantial sureties, who will be required to enter into a bond for the due performance of the contract. Tenders must be addressed to the Town Clerk, Public Health Department, Guildhall, E.C., endorsed "Tenders for Masons' and Paviors' Work," and delivered at the Office of the Hallkeeper, Guildhall, between 12.30 and 1.30 on July 17.

July 17. King's Heath.—*Making good of Woodville Road*, King's Heath. Specifications, bill of quantities, and form of tender may be obtained from the engineer and surveyor to the Council, Ambrose W. Cross, A.M.I.C.E., 23, Valentine Road, King's Heath, on payment of a deposit of £2 2s. Plans may also be seen at the said offices, 23, Valentine Road, King's Heath. Sealed tenders, endorsed "Tenders for making good Woodville Road," must be sent to E. Dockree, 10, Newhall Street, Birmingham, not later than 12 o'clock noon, on July 17.

July 17. Bishopthorpe.—*Asphalting of the play-grounds* (two) at Copmanthorpe Provided School. Sealed tenders to be delivered to B. J. Sheard, Education Offices, Selby (from whom specifications may be obtained), not later than July 17.

July 20. Wycombe.—*Hire of steam rollers* between October, 1906, and March, 1907, by Wycombe Rural District Council. Sealed tenders to be delivered not later than Friday, July 20, to the clerk, 41, High Street, High Wycombe, where specifications can be seen.

July 23. Westhampnett.—*Steam Rolling* for Rural District Council. The contractor will have to supply rollers, water carts and all things necessary or requisite for the execution of the work. The rolling will have to be done at such times and in such manner as the Council or their surveyor may from time to time direct. The contractor whose tender is accepted will be required to enter into a contract for the due performance of the work. The form of contract may be seen and further particulars obtained at the offices of the Council. Tenders stating the weight of rollers and all particulars, with price per day inclusive, marked on the outside "Tender for Steam Rolling" to reach William Duke Rasell, acting clerk to the Council, 5, South Street, Chichester.

July 24. Harrow-on-the-Hill.—*For the supply of about* 2,000 *tons of 2-inch or 1¾-inch broken granite and 1-inch or ¾-inch granite chippings* for the U.D.C., delivered free in such quantities as may be ordered by the Council's Surveyor, at the Harrow Railway Stations (London & North Western Railway or Metropolitan). Tenders are also invited for the supply of about 120 yds. of coarse gravel and 150 yds. of fine gravel, to be delivered free at the Harrow Metropolitan Station in such quantities and at such times prior to March 31st, 1907, as the Council's Surveyor may direct. Samples of granite and gravel to be sent to the Surveyor's Office, carriage paid, before the date of the delivery of the Tenders, and no Tender will be considered unless accompanied by Samples. Tenders, endorsed "Tender for Granite" (or "Gravel," as the case may be), to be sent to J. Percy Bennetts, Surveyor to the Council, Harrow, on or before July 21.

July 24. Southampton.—*Supply of* [1] *2,000 tons of broken granite*, [2] *1,500 tons of broken flints.* Specifications, Conditions, and Forms of Tender may be obtained at the Borough Engineer's Office, 123, High Street, Southampton. Tenders, properly endorsed, must be delivered to R. R. Linthorne, Municipal Offices, Southampton, before 2 p.m. on July 24.

July 28. Chard.—*Rolling the stones* to be laid on main and district roads during the ensuing season. The contractor to provide two 15-ton steam rollers fitted with Henderson's patent detachable scarifiers, and two 10-ton steam rollers, to commence work early in September. Additional rollers to be provided if required. Inclusive charges at per day and at per cubic yard rolled to be named, for the selection of the council. Further information and forms of tender may be obtained from R. Stephens, district surveyor, Ilminster, or F. G. Ross, Rural District Council Office, Chard. Tenders, endorsed "Steam Rolling Tender," to be sent before July 28.

SANITARY.

July 12. Brighton.—*Supplying such glazed drain pipes* as may be required by the Corporation for the year ending July 31, 1907. The specification and form of tender may be obtained on application at the office of the borough surveyor, at the Town Hall, Brighton. Sealed tenders, addressed to H. Talbot, Town Hall, Brighton, and endorsed "Tender for Supply of Drain Pipes," must be left at the Town Hall, before 10 a.m. on July 12.

July 16. Beckford.—*For the execution of all work involved by the connection of house drains to new sewerage system and laying service pipes* from water-mains to houses in the parish of Beckford, Gloucestershire, on the basis of a schedule of prices. Specifications and Schedules may be obtained at the Offices of Willcox & Raikes, engineers, 63, Temple Row, Birmingham, on payment of a deposit of £2 2s. Sealed Tenders, with Schedule of Prices filled in in detail, on the form supplied, endorsed "Beckford Sewerage and Water-Supply House Connections," must be delivered to H. W. Stephens, Winchcomb, Glos., not later than 12 noon on July 16.

July 16. Bedhampton.—*Ventilation, conversion of privies to water closets, new offices and drains and new iron boundary fences* to the school. Persons desirous of tendering may see plans and conditions of contract and obtain specification at the office of W. J. Taylor, county surveyor, The Castle, Winchester, between 9 a.m. and 5 p.m. (Saturdays, 9 a.m. and 1 p.m.) Plans and Conditions of Contract may also be seen at the School. A deposit of £1 1s. will be required for a copy of the Specification. Deposits must be made by cheque, payable to Hants County Council, and crossed Bank of England, or particulars will not be sent. Tenders, endorsed "Proposed Work, Bedhampton Council School," are to be delivered to H. Barber, Clerk to the County Council, The Castle, Winchester, before 10 a.m. on July 16.

July 16. Blean.—*For the supply, delivery, laying, jointing, and of the materials for and the constructions of sewers* at Forty Acres, in the Parish of St. Stephen, for the R.D.C. The whole of the goods to be supplied and work carried out in accordance with the specifications, &c., prepared by the Council's acting surveyor. Plans and sections may be seen at the office of, and specifications and form of tender obtained from, the acting surveyor, L. T. Ashenden, 29, Westgate, Canterbury, on payment of 10s. Tenders to be delivered at the Clerk's Office, 39, Castle Street, Canterbury, on or before July 16, endorsed "Tender for Sewers."

July 21. Hindley.—*Construction of a 12-inch sewer*, about 300 yards long, in Strangeways Fields, Hindley, together with manholes and other works incidental thereto, for the Urban District Council. Persons desirous of tendering for same may obtain form of tender, &c., from the surveyor, Oswald P. Abbott, on payment of £1 1s. Sealed tenders, endorsed "Sewer," to be sent to T. Robey, Council Offices, Hindley, not later than July 21.

MISCELLANEOUS.

July 14th. Priestfield.—*Supply, delivery and fixing of unclimbable fencing* at the Ettingshall Schools, Priestfield, for the Bilston U.D.C. Outline specification and further particulars may be obtained upon application to J. P. Wakeford engineer and surveyor, Town Hall, Bilston. Tenders sealed and endorsed "Tender for Fencing" must be delivered not later than 12 o'clock, July 14.

EXETER CATHEDRAL.

The Dean and Chapter of Exeter have recently been overhauling the fabric of their cathedral. In one of the great transeptal towers a crack has existed, it is said, for half-a-century. This was inspected a few weeks ago, and the result was, on the whole, reassuring. A thorough examination of the foundations of the south tower was next made and has now been completed, with the result that the excavations have revealed the fact that the great fortress-like tower has been resting upon unsubstantial and failing foundations. These consist of 3ft. of large rough stones, which are disintegrated in parts, and broken rubble, resting not upon rock but upon soil.

In spite of the massive proportions of the tower, there are two causes, apart from defective foundations, which threaten its permanent stability. First, it contains the heaviest peal of bells in the kingdom; and when these bells, ten in number, are ringing in chime, the fabric has to take the strain of 27cwt. of metal swinging and vibrating at once. Furthermore, the tower, like its companion, stands on only three basement walls. The interior, or fourth wall, was removed in the thirteenth century by Bishop Quivil, who thus converted the separate chapels at the base of each tower into the present transepts.

Workmen are now engaged in extending the foundations of the south tower, which are being deepened by 8 or 9ft. It is intended that these new foundations shall be supported by a thick bed of concrete, and strengthened by buttresses of the same material to resist the outward thrust of the masonry, the walls of which are 7ft. thick.

A New Nurses' Home and Laundry have been added to the North-Eastern Hospital for Children. The total cost has been £12,500.

Appointments Wanted.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterward, prepaid. Three insertions may be had for the price of two. Advertisements must reach the Office not later than 5 o'clock on Monday.

ADVERTISER (39), thorough knowledge of marble and granite, desires position as REPRESENTATIVE; good connection with Architects and leading Contractors; references.—W. G. Renwick, 1, Lennard Road, Penge, S.E. 1937

ARCHITECTURAL ASSISTANT (27) desires re-engagement; nine years' varied London and Provincial experience; design, details, working drawings, perspective, &c.; excellent testimonials; moderate sa'ary.—Address Box 1905, Builders' Journal Office, 6, Creat New Street, Fetter Lane, E.C.

ARCHITECT'S ASSISTANT desires permanent or temporary engagement; six years' experience; working drawings, measuring, &c.; good references; moderate salary.—H. S., 65, Hilldrop Crescent, Camden Road, N. 1935

ARCHITECT'S and SURVEYOR'S ASSISTANT desires ENGAGEMENT; five and a half years' varied experience; excellent references.—Apply Box 1898, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT and SURVEYOR'S JUNIOR ASSISTANT (21) desires change; plans, details, superintendence, surveys, levelling, &c.; assist quantities; reasonable salary; references; town or country.—Box 1904, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT and SURVEYOR, young, is prepared to assist in the preparation of contract or competition drawings; surveys made for alterations and dilapidations; 10 years' London experience.—E. C., 100, Archway Road, N. 1903

ARCHITECT'S DRAUGHTSMAN. 11 years' London and Country experience; quick and accurate; good teslimonials and references; moderate salary.—R., 8, Buxton Road, Luton. 1896

ARCHITECT'S JUNIOR ASSISTANT requires post; 5 years' experience; neat, quick tracer, colourist, sun-printing, inking-in, specifications, working drawings; excellent references.—Box 1923, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT'S JUNIOR ASSISTANT shortly disengaged, 5 years' London experience; usual office qualifications.—Address Box 1931, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

ASSISTANT (22) wants SITUATION; office work, shorthand (100); surveying, tracing, and quantities.—G. H., 85, St. Stephen's Avenue, Shepherd's Bush, W. 1938

BRICKLAYER, age 34 (abstainer); brickwork, alterations, pointing, plastering, drains, roofs, tiling, stoves, kitcheners, and general estate repairs.—H. E., 14, Broxted Road, Catford, Kent, S.E. 1922

BRICKLAYING and POINTING wanted, by Rod or Job.—C. Baker, Loriner Lodge, Sydney Road, Colney Hatch Lane, N. 1936

BUILDER'S and DECORATOR'S CLERK (33) desires Whole or Part Time EMPLOYMENT; 18 years' first-class experience; thoroughly capable and reliable; moderate salary. — Settle, 64d, Salusbury Road, West Kilburn, N.W. 1900

BUILDER'S CLERK (29), present situation 11 years, desires change; good inside and outside experience; prime cost, plans, quantities, &c.—Box 1920, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

CLERK (33) seeks ENGAGEMENT; 19 years' varied building trade experience; well up in book-keeping, prime cost, merchant's accounts, correspondence, &c.—Address Holmes, 10, Castle Road, Southsea. 1930

EXPERIENCED PAINTER and PAPERHANGER, good leading hand, wants permanency.—Wm. Stevens, Medstead, Alresford, Hants. 1941

FITTER'S MATE requires SITUATION; experienced in heating, hot-water, plumbing and gas-fitting; age 22; references.—J. Crabb, 18b, Peabody Buildings, Old Pye Street, Westminster. 1929

GENERAL FOREMAN, age 52, thorough CARPENTER; 30 years' Foreman's experience, town and country. New work or alterations. Good references.—H., 54, Redfern Road, Harlesden, N.W. 1919

GENERAL or WORKING FOREMAN seeks re-engagement; thoroughly experienced in all branches; five years' good references; trade carpenter and joiner; age 33.—C. S., 86, Brunswick Road, Leyton. 1921

IMPROVER (21) desires situation in Architect's office (anywhere in the United Kingdom), at a small salary; good draughtsman, &c.—The Builders Journal Office, 6, Great New St., Fetter Lane, E.C. 1906

LAND AGENTS or SURVEYORS.—Engagement desired as Junior Assistant; good draughtsman; proficient in building work and design; knowledge of land surveying and quantities.—Box 1924, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

PAPERHANGER, good, wants piecework; distance no object.—C. Markham, 11, Great Sutton Street, Clerkenwell, E.C.

PART-TIME ENGAGEMENT required by Builders' General Clerk, one or two days weekly; prime cost, accounts, book-keeping (d.-e.), balance-sheets, &c.—H. C., 77, Lyndhurst Road, Peckham, S.E. 1907

PLUMBER, GAS and HOT-WATER FITTER desires PERMANENCY; good references; total abstainer; wages moderate.—P. A. J., "The Lodge," Bonner Hill Road, Kingston, Surrey. 1917

SHOP FOREMAN OF JOINERS seeks re-engagement; energetic, punctual; good manager; shop, bar, and office fittings, stairs, &c.; good references.—J. W., 58, Lower Richmond Road, Putney, S.W. 1928

WORKING FOREMAN (Bricklayer) wants re-engagement; have taken entire charge; 50s.; distance no object; good references; abstainer 20 years.—J. J., 48, Dorset Road, South Tottenham. 1897

YOUTH (18), from leading Architect's office; 3½ years' experience; excellent tracer and colourist; construction, perspectives, usual office routine; excellent references from late offices; salary, 15s.—Box 1939, Builders' Journal Office, 6, Great New Street, Fetter Lane, London, E.C.

ARCHITECT'S ASSISTANT (21).—Three years' good experience; good references; can prepare complete working and detail drawings from rough sketches; good designer, perspectives, tracing and colouring.—H. J. W. E., 2, Stone Villas, Camberwell Grove, S.E. 1947

WANTED by an A.R.I.B.A., a position as Surveyor, Clerk of Works, Estate Agent, Steward, &c.; has had great experience in architecture and surveying; first-rate testimonials.—Apply Box 1944, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

PART-TIME ASSISTANCE to Builders and Contractors in quantities, variations, estimates, drawings and accounts by practical builder's clerk.—C., 61, Sydenham Road North, Croydon. 1946

MACHINIST (24) wants JOB; good experience; overhand thickness, circular bandsaw, etc.; good reference; sharpen saws (gas engine).—W. Luff, 19, Ashdown Street, Queen's Crescent, Kentish Town, London, N.W. 1945

MACHINIST seeks CONSTANCY; all-round hand; 16 years' practical experience hard or soft woods; single-handed, cutter-making, saw-sharpening; come at once anywhere, Midlands preferred.—Ernest, 21, Sixth Avenue, Enfield. 1950

SHOP FOREMAN of JOINERS seeks re-engagement; energetic, punctual, economical manager of men and machinery, has conducted trade shop; town or country.—Rushton, c/o Mr. Harris, Police Court, Bow Street, W. 1948

ARCHITECT'S JUNIOR ASSISTANT desires engagement, commencing July 30; competent.—R. S. Bowers, 46, Newington Butts, London, S.E. 1953

Appointments Vacant.

AGENTS REQUIRED in London, Suburbs and the Counties with connection amongst Architects, Borough Surveyors and Contractors, to represent manufacturers of structural steel, cast and wrought-iron work of every description, commission at first.—Particulars to Box 1942, Builders' Journal Office, 6, Great New Street, Fetter Lane, London, E.C.

ARTICLED PUPIL.—Architect with well established practice in country town in Essex has vacancy for pupil; moderate premium.—Apply Box 1927, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

ARTICLED PUPIL.—VACANCY for same in old-established London Architect and Surveyor's office.—Box 1816, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

FIBROUS PLASTERING.—Steady energetic man, capable of taking entire charge of FACTORY about to be opened; applicants must have a long and up-to-date experience in above-named line.—Address, giving fullest particulars as to experience, references, salary, etc., Box 1952, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

JUNIOR CLERK WANTED in Builder's office; age about 16; must be methodical; one with knowledge of shorthand preferred; good opportunity for smart boy. Apply by letter, stating qualifications and experience.—M. & P., 165, Gray's Inn Road, W.C.

WANTED.—DRAUGHTSMAN by firm of Constructional Engineers; must be quick at figures and able to complete stresses, detail stanchions, girders and roofs, and make up estimates; only a rapid worker will suit; salary about £2.—Box 1951, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

Drawings, Tracings &c.

ABLE ASSISTANCE.—Architectural drawings, designs and perspectives by R.A. Exhibitor, Tite Prizeman, at own office.—Box 1934, Builders' Journal Office, 6 Great New Street, Fetter Lane, E.C.

ADVERTISER undertakes ARCHITECTURAL DRAWING, &c., at his own Offices at moderate charges.—Box 1908, Builders' Journal Office, 6 Great New Street, Fetter Lane, E.C.

AN ARTIST and DRAUGHTSMAN is prepared to undertake Architectural Drawings or Designs for manufacturing firms, either in office or at home. Perspectives, Illuminated Addresses, &c.—E.S.B., Box 1813, Builders' Journal Office, 6 Great New Street, Fetter Lane, E.C.

ARCHITECTURAL ASSISTANCE.—DRAWINGS, TRACINGS, SURVEYS. PERSPECTIVES, &c., prepared at moderate charges. Photo copies.—C. Boswell, 52 Gray's Inn Road, W.C.

ARCHITECTURAL DRAUGHTSMAN, disengaged; accustomed to large works. Perspectives, details, designs prepared from rough sketches &c. Experienced. Per hour or job.—Box 1918, Builders' Journal Office, 6 Great New Street, Fetter Lane, E.C.

ASSISTANCE rendered in the preparation of Architectural Drawings, &c., at advertiser's own address.—Box 1717, Builders' Journal Office, 6 Great New Street, Fetter Lane, E.C.

DRAIN PLANS PREPARED.—John Lawrence, Jun., M.R.S.I., A.I.S.E., 112, Shirland Road, W.

DRAUGHTSMAN (31) wants berth; experienced in Institution work, sketch plans, own initiative.—Box 1940, Builders' Journal Office, 6 Great New Street, Fetter Lane, E.C.

PERSPECTIVE ARTIST prepares ink or colour drawings; moderate terms.—L.C., 11 George Street, Halifax.

PERSPECTIVES effectively executed.—General Architectural Drawing.—Claude H. Simpson, 35, Spencer Road, Acton, W.

PERSPECTIVES and DESIGNS expeditiously executed.—Lewis Bander, 83, Sandmere Road, Clapham, S.W. 1954

Miscellaneous.

A. J. ARROWSMITH, 22, Mount Street, Berkeley Square, London, W. Wood Mantelpieces, Panelling and Parquet Flooring.

AN Architect has GOOD LIGHT FURNISHED ROOM to LET with separate entrance. Suit Architect or London Agent.—Box 1916, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

BOGNOR.—To Let, Furnished House (or Apartments).—Apply, French, "Lansdowne," Esplanade, Bognor.

"GRANDMASTER."—Grove Flanged Draught Chimney Pot. Noiseless, efficient.—Parkinson, Greenhill Road, Armley, Leeds.

POLING BOARDS, selected lengths and thicknesses (best quality and full measure).

Also Scaffold Boards, Putlogs, Scantlings, Deals, Battens and Boards. Lowest wharf prices.

C. H. GLOVER & Co., Ltd., Importers, Hatcham Saw Mills, Old Kent Road, S.E.

ROAD LOCO FOR SALE. An 8 h.p. ROAD LOCO by Aveling and Porter, in good condition.—Apply, Box 1912, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

SECOND-HAND OPTICAL MART
for the Purchase and Sale of
LEVELS, THEODOLITES, DRAWING INSTRS.

THE BUILDERS' JOURNAL
AND ARCHITECTURAL ENGINEER.
July 11th, 1906.

SPECIAL SUPPLEMENT:

The Ritz Hotel, Piccadilly, London.

THE RITZ HOTEL.

From time to time during the past two years we have illustrated the erection of the Ritz Hotel, in Piccadilly, London, and now that the building has been completed and opened we give, in conclusion, a series of views of the finished work. From a constructional point of view the hotel has been especially interesting, as being the most comprehensive example in this country of American methods carried out on a large scale. For that reason we have published the complete set of steel frame plans of the building, and though some of our readers not directly concerned or able to appreciate the economical design of steelwork have thought we were devoting too much space to them, we have the satisfaction of knowing that these plans of the first complete steel skeleton building in London have received the most careful examination and the approval of well-known architects and engineers.

The Planning.

As regards the general planning there is not much to be said. The architects of the hotel are Messrs. Mewès and Davis and John P. Bishop (consulting). Mr. Mewès is a well-known Parisian architect who designed the Palais des Congrès at the Paris Exhibition of 1900, was engaged as decorator of the Carlton Hotel, London, and in 1898 was responsible for the design of the Ritz Hotel in the Place Vendôme, Paris. His influence, naturally, is noticeable as departing somewhat from English custom in details, but on the whole the plan conforms to recognised standards in hotel design. In the basement there is a banqueting hall, with reception rooms and private dining gallery, reached by a special staircase. The lower ground floor is devoted to the service, containing the kitchens and dependencies. Upon the ground floor are the entrance hall, grand gallery, staircase, lifts, managerial offices, restaurant, Marie Antoinette dining room and winter garden with shops on the Arlington Street and Piccadilly fronts, while the upper floors are devoted to suites of apartments consisting of reception (or sitting) rooms and bedrooms. There are over 150 bedrooms and salons, and about 75 bathrooms. The rooms are arranged in suites, comprising sitting-rooms, two bedrooms and two bathrooms with separate lavatories, the bath and dressing rooms being larger than is common even in first-class hotels. Each suite is shut off from the main corridor by its own private lobby.

The hotel was intended to cater for first-class custom, and the appointments and planning have been so designed. It is, undoubtedly, one of the handsomest and best arranged hotels in London.

The arcade is to be noted as a feature of the external treatment and as a precedent in street widening. There are, unfortunately, few such arcades in London. They offer such obvious advantages that it is surprising they have not more often been adopted.

The Ritz Hotel we think reflects credit on all concerned in its erection, not only upon the architects, but upon the general contractors, the Waring White Building Co., Ltd., and also Messrs. Waring & Gillow, who have been responsible for the decoration and furnishing. The contractors were faced with many difficulties, and were carrying out a form of construction novel in this country; yet, not only have they met these difficulties triumphantly, but have completed the building quickly. The decoration and furnishing is in keeping with the high reputation which Messrs. Waring & Gillow have created, and we feel inclined to say that the hotel is better appointed than any at present existing in London.

The Construction.

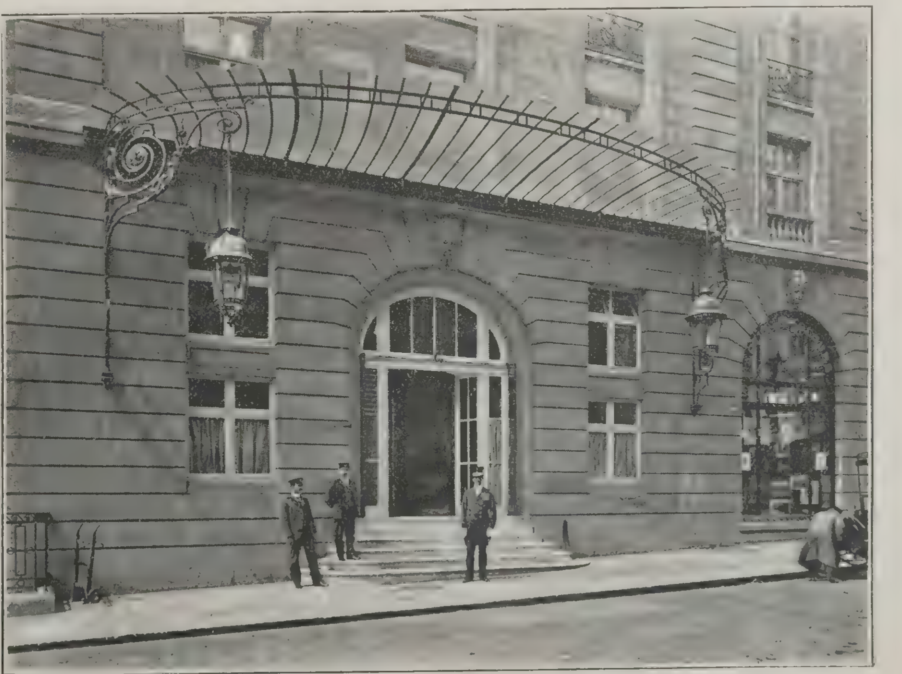
The articles before referred to in which the construction has been dealt with appeared in our issues for September 28th and November 2nd and 30th, 1904; March 1st and 22nd, April 12th, May 24th, and September 13th, 1905; and January 10th and April 18th, 1906. These articles contain, as stated, the working drawings, the photographs of the building in various stages of construction, and notes by the contractors' engineer who is responsible for the design of the steelwork, Mr. S. Bylander.

From the first the job showed features of novelty. Some readers may recollect that upon the site where the hotel now stands there was a large block of offices called Walsingham House. This had been built only a few years before, and, as was customary at that time, the foundations took the form of a raft of concrete. This raft was about 3ft. thick and of good material, and consequently opposed considerable resistance to ready and economical excavation. The contractors quickly found that this could not be removed adequately by the ordinary methods of splitting with wedges and hammers, so they had resource to

Blasting.

Pneumatic drills were used for boring the holes to receive the charges. They were of the Chicago rock drill pattern and consumed only 42 cub. ft. of free air per minute. The weight of each drill was 50lbs., and it was easily operated by unskilled labour with perfect safety. Cartridges with small charges were used for blasting in order to avoid any danger of disturbance, and the concrete was broken off in small lumps easy to handle. To avoid splinters flying about, the portion of work to be blasted was just covered over with a tarpaulin before the charge was exploded. The result was that the work of excavation was done in one-twentieth the time that would have been required to do it by hand.

The excavation work was in other respects simple; carts were run down an inclined way, the site being of sufficient area to avoid any necessity for using cranes to lift the excavated material.



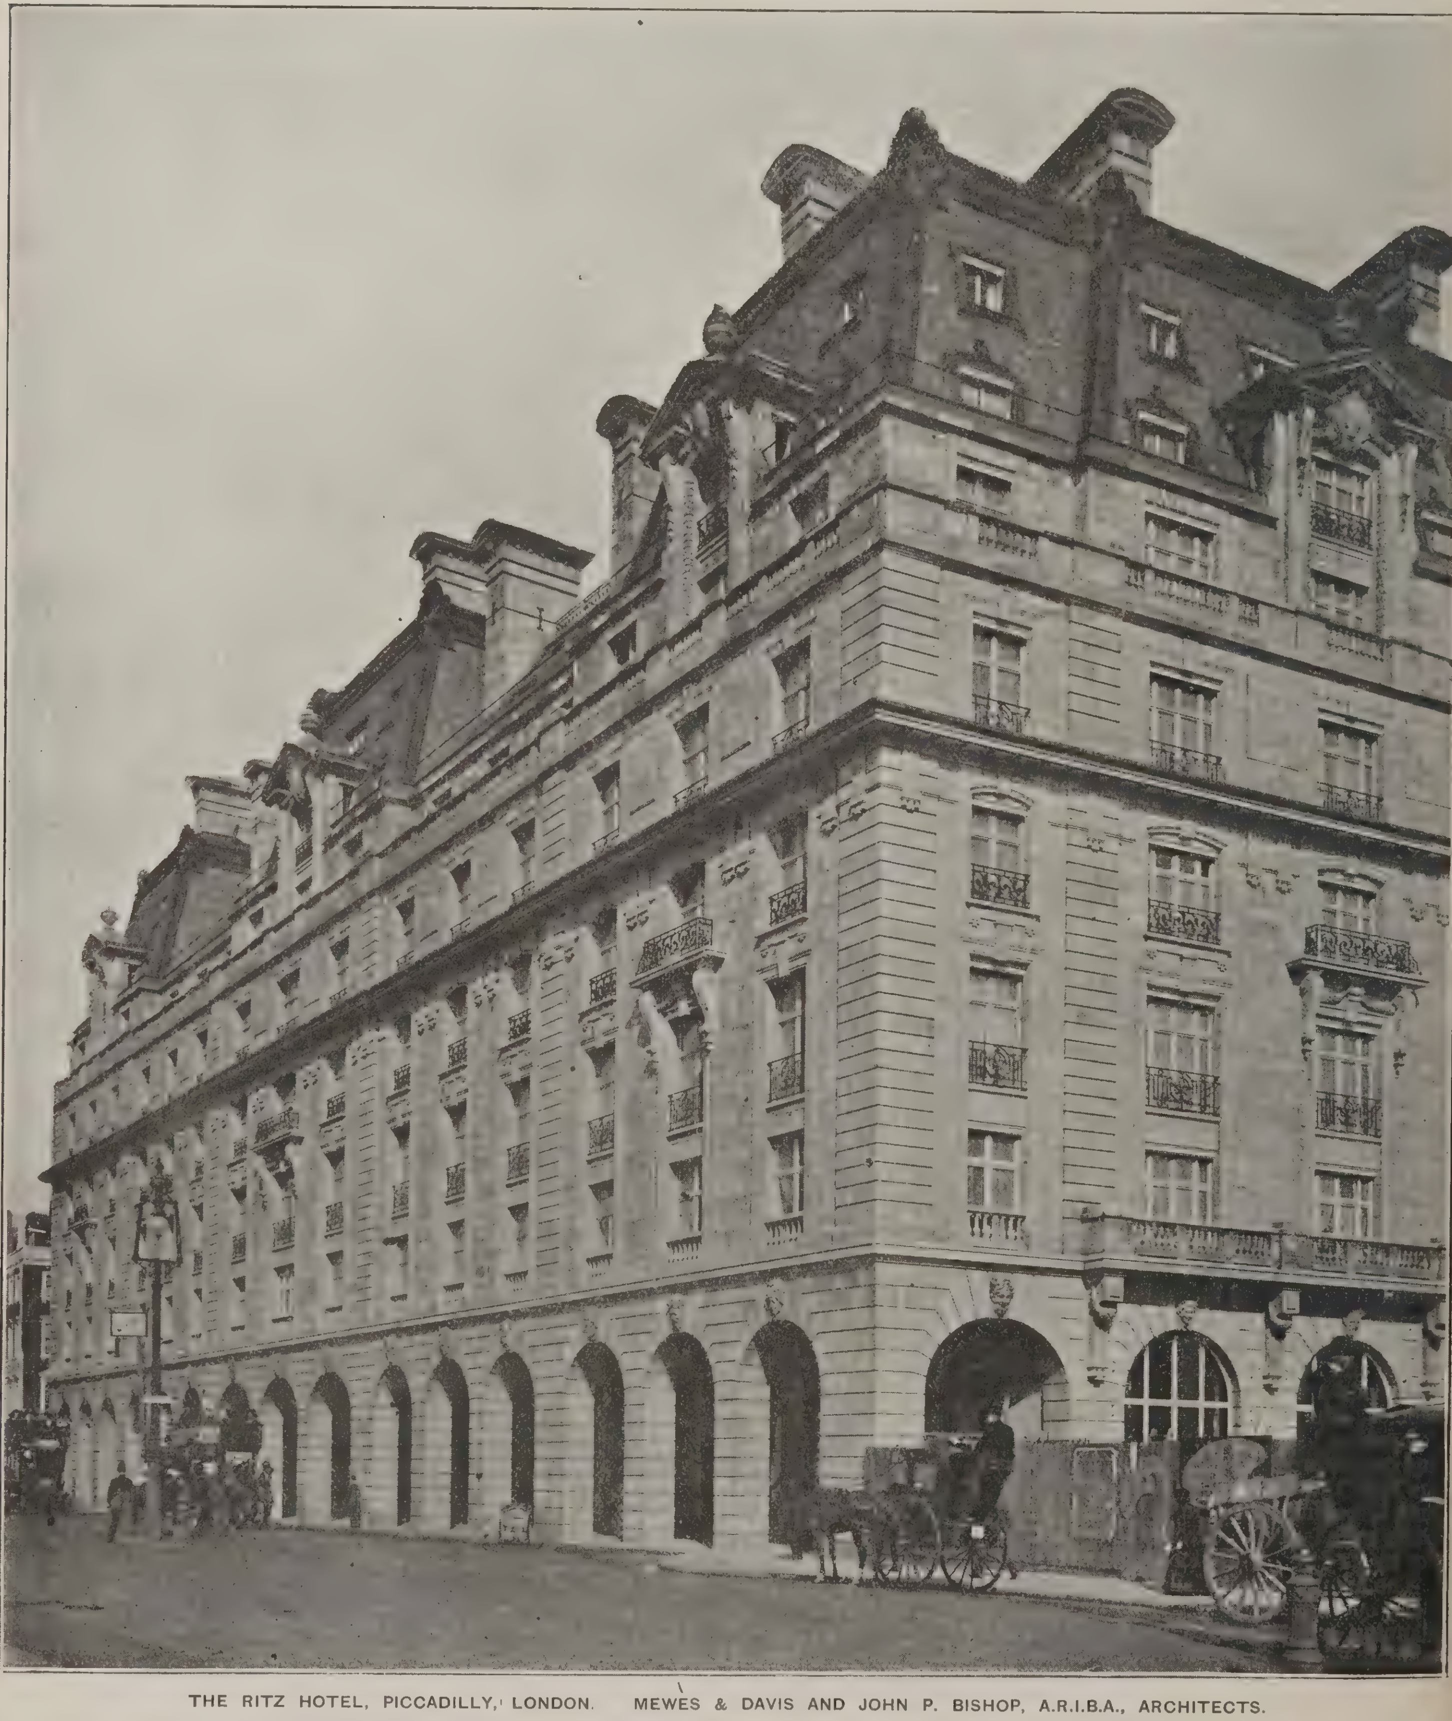
MAIN ENTRANCE TO RITZ HOTEL IN ARLINCTON STREET.

The Main Frontage

of the hotel is on Piccadilly. It is bounded at one end by the Green Park, at the other by Arlington Street. The length of the Piccadilly frontage is 231ft. 4½ins.; that of Arlington Street, 115ft. 2¾ins.; and the frontage to the Green Park, 87ft. 1⅛ins. The angle of the building lines between Piccadilly and Arlington Street is 83° 3′, and to Piccadilly and Green Park 96° 36′, as shown on the site plan published in our issue for November 2nd, 1904. The area of the site is about 23,200 sq. ft., and the area of the ground floor 22,000 sq. ft. The average area of each of the upper floors is about 19,000 sq. ft.

The finished floor level of the ground floor of the hotel, which was used as a datum, was 1ft. 6ins. above the pavement level at the main entrance on Piccadilly. The basement floor is 22ft. 7½ins. below the ground-floor level. Part of the building has a mezzanine floor between the basement and ground floor, this being called the lower ground floor. Above the ground floor there are seven floors.

On the Piccadilly and Green Park fronts the roof slopes at an angle of 75° and extends from the sixth floor to the level of the flat roof, which is 98ft. above the ground-floor level. Owing to the trouble of ancient lights, the roof at the Arlington Street side was made sloping from the



THE RITZ HOTEL, PICCADILLY, LONDON. MEWES & DAVIS AND JOHN P. BISHOP, A.R.I.B.A., ARCHITECTS.

THE ARCADE.

fourth floor at an angle of 45°. Along the Piccadilly frontage there are 3 pavilions, the highest point of which is 114ft. 6ins. above the ground-floor level.

The cubical contents of the building is about 2,413,000 cub. ft.

Steel Frame Construction.

The building differs in no essential particular from the regular American steel frame or so-called skeleton or cage construction. All loads, inclusive of exterior walls, are carried on beams and girders to the stanchions and the grillages.

With the steel frame building it is, of course, of the utmost importance that the setting-out should be of great accuracy, because the steelwork being prepared away from the job must come together exactly when erected. With the Ritz Hotel the site was too large for accurate surveying in the ordinary way with the chain, and the theodolite had to be used. The exactitude required, however, is an advantage in another way because it enables work of all kinds to be prepared in advance with the certainty that it will eventually fit into place without any cutting about. Thus all the dimensions for the granite and stone work were taken from the steel drawings in the preliminary stages of the work, and the masonry prepared at the quarries.

The Foundations

for the Ritz Hotel do not consist of the concrete raft which, as we have said, was the former practice for large buildings, but they conform to ordinary American practice with regard to steel buildings. All the foundations are independent—*i.e.*, the foundation under each stanchion is proportionate in area to the load it has to sustain and consists of grillages of steel joists embedded in concrete. In view of the erection of the steelwork independently of the brickwork or masonry, and its serving as a scaffold for the building, care had to be taken in the design for bracing during erection.

The Front Walls

facing Piccadilly, Arlington Street and the Green Park are of Norwegian grey granite up to the first-floor level, and Portland stone above, all with brick backing. Notwithstanding the fact that all the external walls are supported on the steelwork, and that a special concession was obtained for the construction of the building on this steel frame principle, the absurd requirements of the London Building Act as regards the thickness of walls had to be adhered to. They are, therefore, 39ins. thick at the street level, and 14ins. at the sixth floor level.

The Main Stanchions,

upon which the loads are transmitted to the foundations, are placed in straight lines square with the Piccadilly building line wherever possible and as far as architectural requirements have allowed. Care was taken to place them so as to allow for easy erection. The stanchions are supported at the basement level on cast-iron bases, averaging 3ft. square, these bases, again, resting on the steel and concrete grillages before referred to. Underneath the grillages there are concrete footings about 18ins. thick, and placed in pockets excavated in the clay, about 5ft. 6ins. deep below the basement level. The average size of the grillage foundations is 12ft. All the grillages of the beams are braced and kept apart by ¾in. thick cast-iron separators, and tied together with ¾in. diameter bolts.

In Figuring the Sizes of Footings

the dead load only was considered in order to secure uniform settlement, if any, and the following assumptions were made in their calculation:—

Weight of brickwork laid in cement mortar - - - - - -	120lbs. per ft. cu.
Ditto granite - - - -	170 ,, ,, ,,
Ditto stone - - - -	150 ,, ,, ,,
Ditto floors, inclusive of steel -	100 ,, ,, ,,
Weight of steel columns . . .	calculated from quantites.

As the total dead load of the floor only amounts from 80lbs. to 90lbs. per sq. ft., about 10% of the live load was included in figuring the floor load on the footings, this being estimated to allow for the weight of terra-cotta partitions, pipes and ducts. The sizes of the footings were calculated to the conservative figure of 5,000lbs. per sq. ft. The stanchions are figured for the full dead load, and 80% of the live load. Girders and beams are figured for the full dead and live loads.

The connections between beams and girders, and girders and stanchions were made as far as practicable in proportion to the loads they had to carry. With very few exceptions, the connections were all riveted. The rivets were determined to carry the loads, and no beam was milled at the ends to fit the lower flange of the beam on which it is resting, as usual in English practice, but strong connections were used to keep the beams supported laterally, and to transfer the loads centrally to the beams.

GRANITE BLOCK AT QUARRY READY FOR SHIPMENT.

In Calculating the Stresses

in the steel, a factor of safety of 4 was adopted. The fibre stresses allowed were:—

16,000	lbs. per	sq. in.	for rolled beams and girders.
15,000	,,	,,	,, riveted works.
20,000	,,	,,	,, bearing for rivets.
10,000	,,	,,	,, shear for rivets.

The Steel Stanchions Used

are of the closed cross-section type, consisting of two 12-in. channels and 14ins. wide cover plates, except on the upper floors, where two 12-in. channels latticed were used, as the loads were less. All the steel stanchions were designed for concentrated and eccentric loads. In the cases, however, where the eccentric loads were very small they were taken as eccentrically loaded, but a fibre stress of 12,000lbs. per sq. in. was used. For eccentrically loaded stanchions a maximum combined stress of bending and compression of 14,000lbs. per sq. in. was allowed. Calculations for eccentric loading, however, are seldom made in English constructional steelwork design, as they should be.

The outside dimensions of the stanchions were kept practically constant. The cross-section, however, was changed by using channels and plates of different thickness.

DETAIL OF BALCONY FACING THE GREEN PARK.

By this method fifteen different sections were adopted. Where very heavy loads had to be carried, the section was strengthened by adding reinforcing plates riveted to the back of the channels.

The area of the heaviest stanchion section is 142 sq. ins. Above the second floor the sections are reduced to two-channel type. All stanchions were made in two-storey lengths and spliced at a distance of about 1ft. 6ins. above the floor level, their sections being changed at each splice to correspond with the load they were intended to carry. Both ends of the stanchions were milled, and in the splice a cap-plate or horizontal diaphragm of exact dimensions was bolted to the stanchion with angles. This cap-plate gives a good bearing for the stanchion above. The upper sections were secured to the lower by field-riveted vertical splice-plates.

Cantilever Foundations.

Owing to the heavy external back walls and the limited area available for foundations, recourse has been had to what is distinctly a novelty in this country, although it has been a good many times adopted in America. We refer to cantilever foundations. It may be explained that, where in America it has been deemed undesirable to enter upon neighbouring ground and underpin adjoining buildings, foundations have been placed on the building owner's land, and the walls adjoining neighbouring buildings supported beyond these foundations by means of cantilever beams. These cantilevers where they come over the foundation rest on steel pin rockers upon cast-iron bedplates. The object of the rocker is, of course, to cause the transmitted thrust to be vertical on the foundation, and obviate the risk of the latter being subjected to an inclined thrust, which might cause damage—a contingency that is not unlikely to occur, as natural settlements must take place in every building. In our issue for March 22nd, 1905, a method of calculating the cantilever girders was given.

Trusses

At the Green Park end on the ground floor there is a large restaurant, and the desire to secure this floor area free from obstructions led to a somewhat complicated piece of steelwork design in the floor above, trusses being adopted so as to take the loads from the stanchions situated in the centre of the span. A view of these was published in our issue for March 1st, 1905.

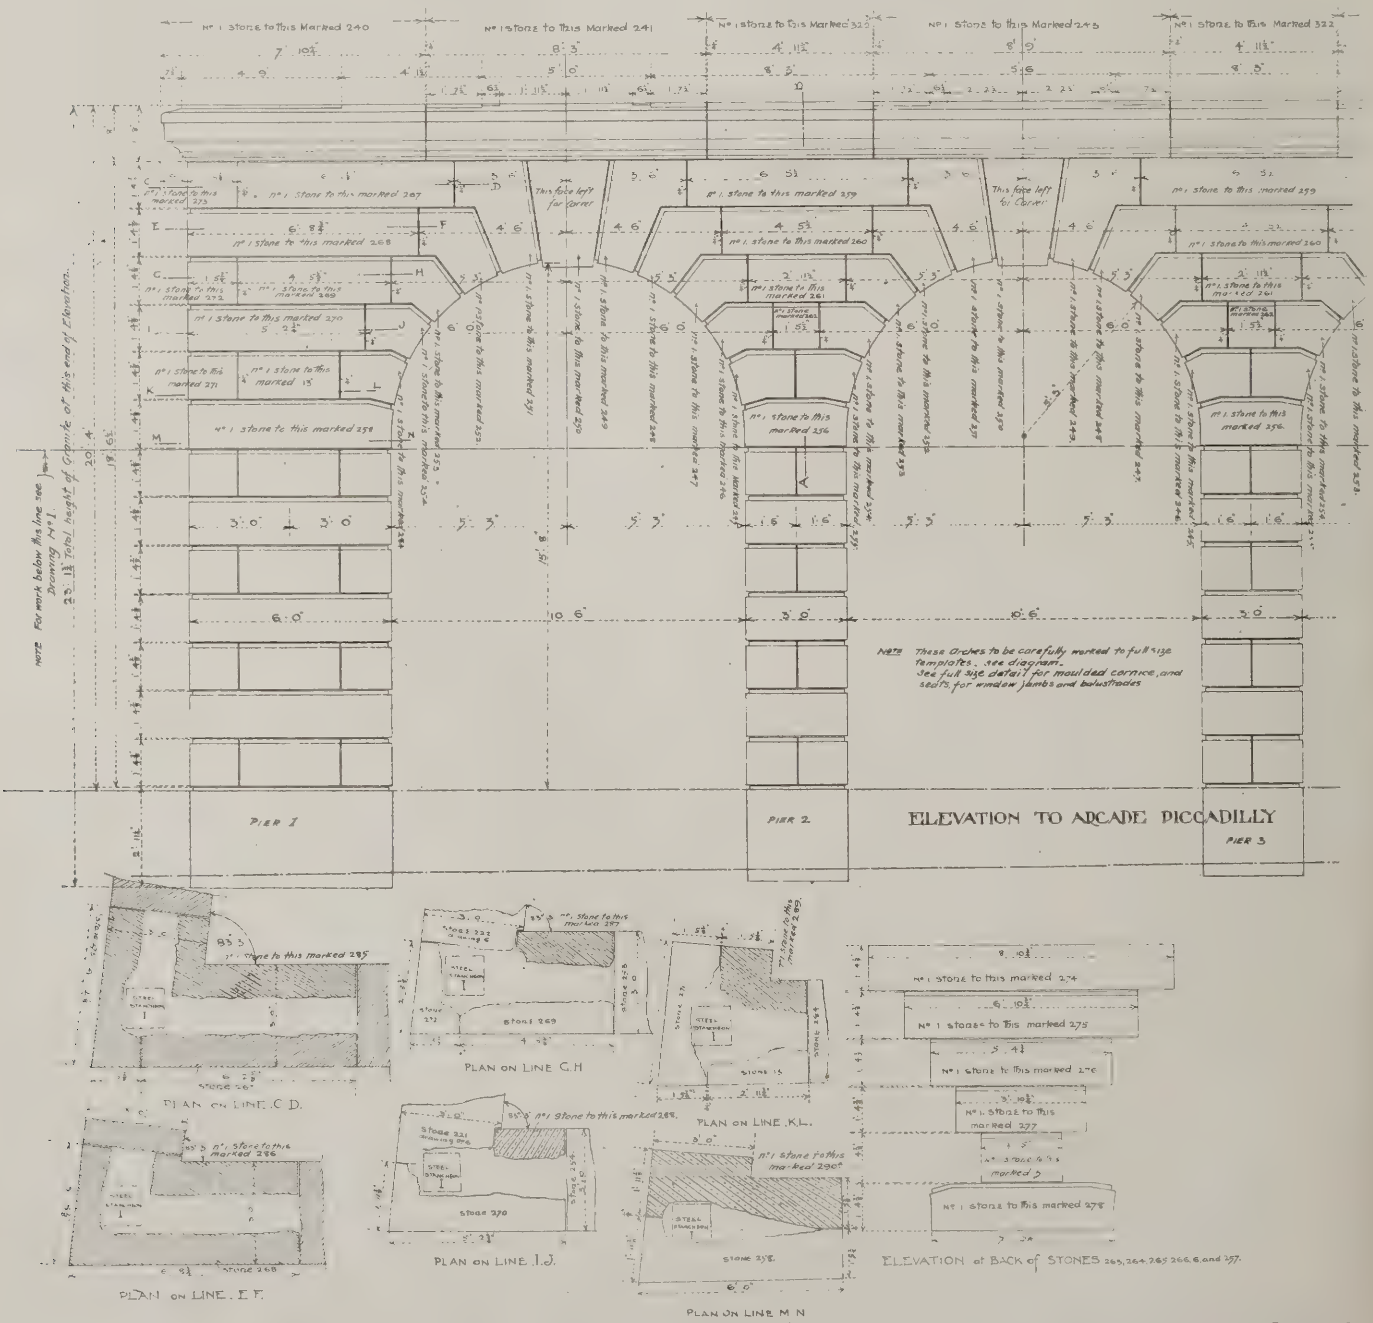
In each of the corner pavilions water tanks are placed and the construction supporting them is, where necessary, braced by diagonal rods with turn buckles.

The Chimney

from the kitchen is a steel one with a fire-brick lining. Inspection joints are provided for each floor level, and brackets keeping the chimney in place are allowed to slide upon their supports. The space between the steel flue and the walls is used for ventilation.

American Derricks.

In the erection of this hotel one striking feature was the use of American derricks.



ELEVATION TO ARCADE PICCADILLY

PLAN ON LINE G.H
PLAN ON LINE I.J.
PLAN ON LINE K.L.
PLAN ON LINE M N
ELEVATION of BACK of STONES 265, 264, 265 266 & and 257.

NOTE.—The figured dimensions must in all cases be taken in preference to the scale. The whole of the exposed face to be fined-axed. All joints to be fine-axed and perfectly true. Where figured dimensions are given on the beds they must not be exceeded, but may be less. The dimensions given on the faces and joints must be strictly followed. All the stones when worked must be numbered with the number given on the plan in black on one of the joint sides. The faces must not be marked.

DETAILS OF GRANITE WORK: PART OF ELEVATION OF ARCADE TO PICCADILLY, ARLINGTON STREET END.

Each of these has a mast supported by guys, with a jib-boom somewhat shorter than the mast so as to work round under the guys, thus enabling the derrick to be turned round so as to distribute material round a complete circle. The wire hoisting rope runs through the base of the derrick, so enabling the machinery to be placed from the first in one fixed position in the basement and the derrick moved up floor by floor as required. A somewhat similar kind of derrick was also used for lifting subsidiary materials on to each floor, the mast in this case being attached at base and head to the steelwork.

Numbering System.

A special feature was made throughout the job of the system of numbering pieces of the steelwork, so that they should be readily found when they were received from Germany, and with a view of avoiding mistakes and saving time and trouble. Endeavour also was made to standardize brackets and other parts of construction wherever possible, so as to economise.

A Very Large Number of Drawings

was necessitated by reason of the great elaboration to which the design of the steelwork was carried. Thus there were:—

222 drawings measuring 40ins by 27ins.
516 .. .. 28 .. 14 ..
1,299 .. .. 14 .. 9 ..

thus totalling 2,037. The total amount of blue printing paper used has been approximately 13,000 lin. ft., 30ins. wide.

A SITTING ROOM.

The number of drawings required shows that the system adopted was expensive in the engineer's office, but it is evident that money was saved and better work obtained than would otherwise have been the case; on the whole making a considerable saving.

It is interesting to note that in the whole building there are approximately the following pieces of steelwork used:—

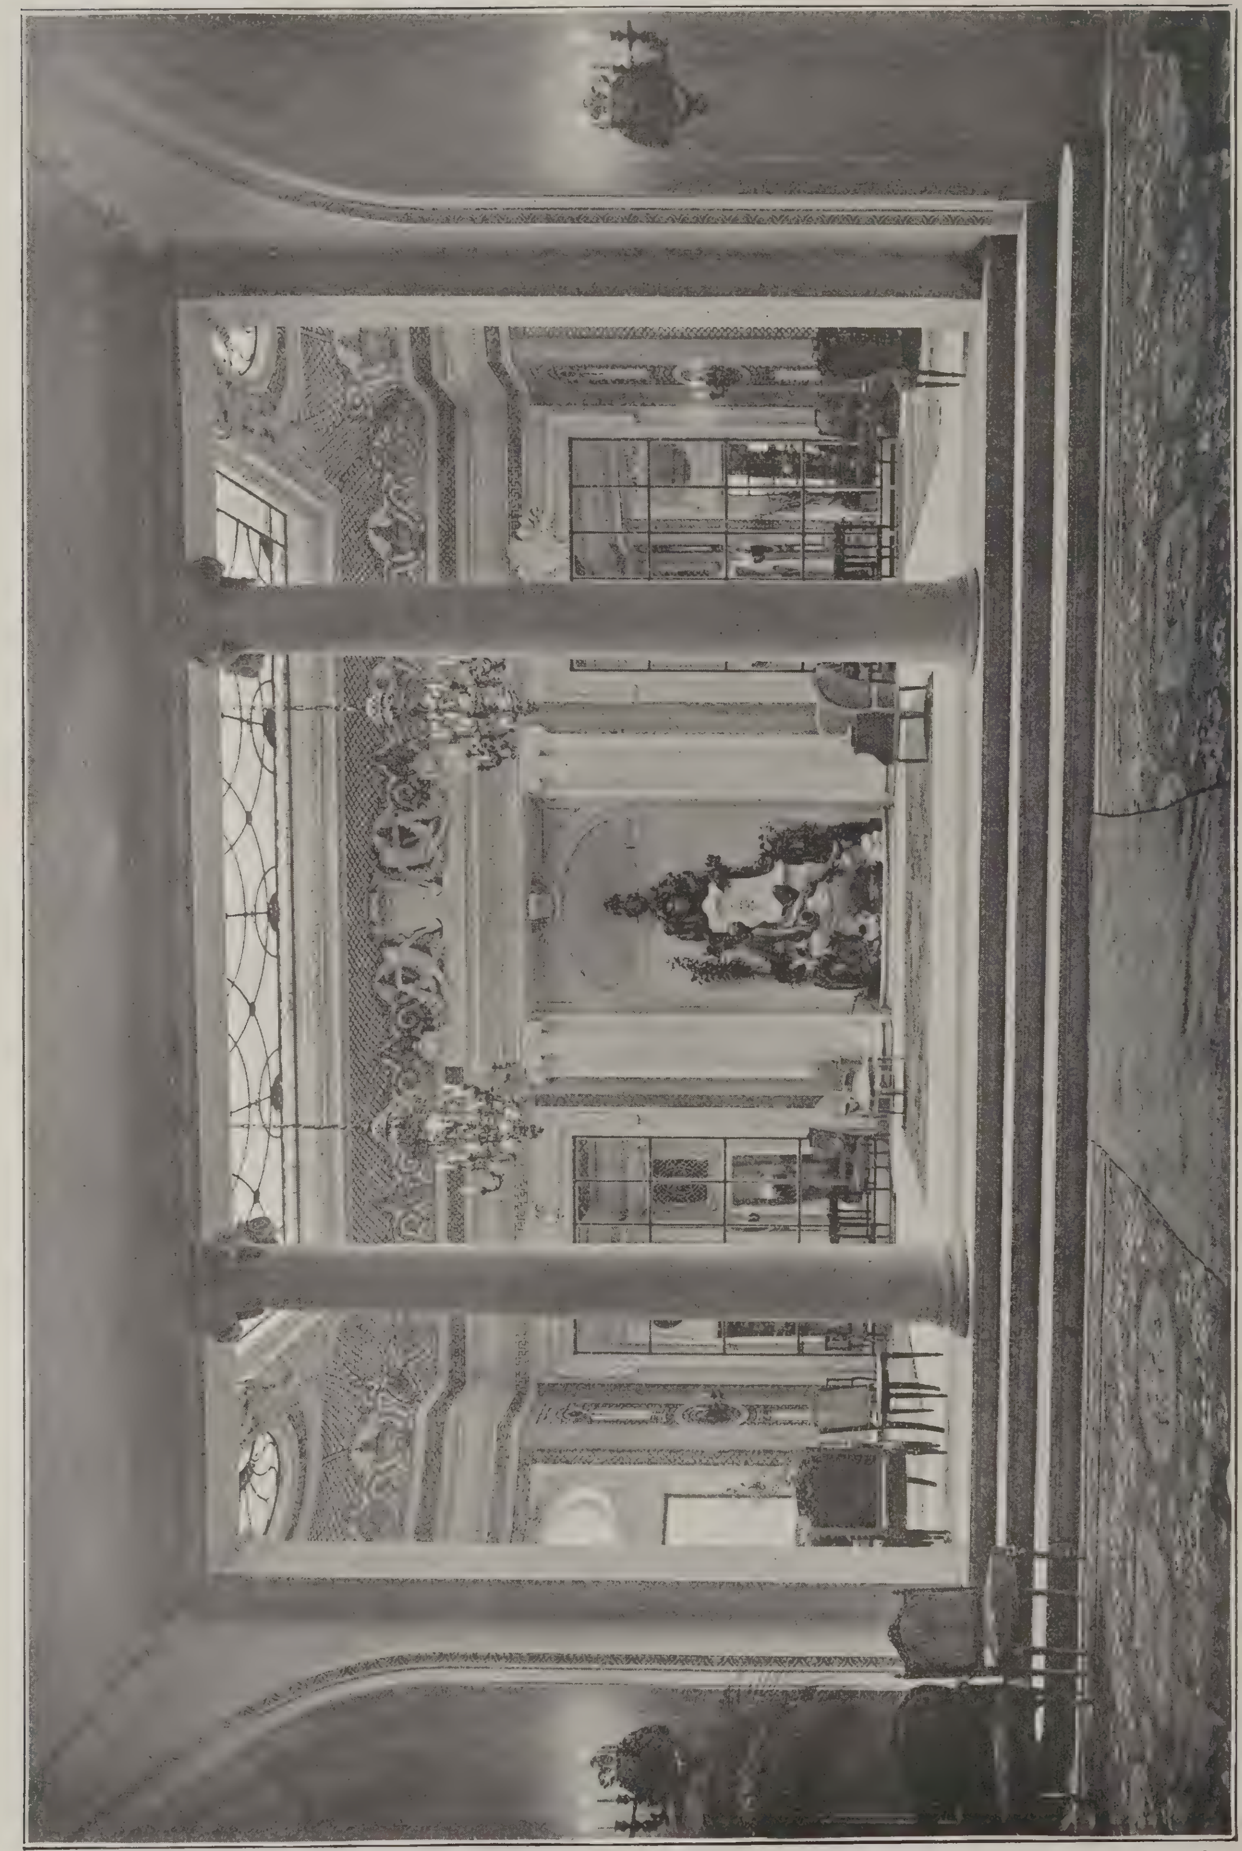
Beams	5,200	Trusses	3
Stanchions and Struts	550	Cast-iron separators	4,000
Plate Girders	55	Field Rivets	44,000

Granite.

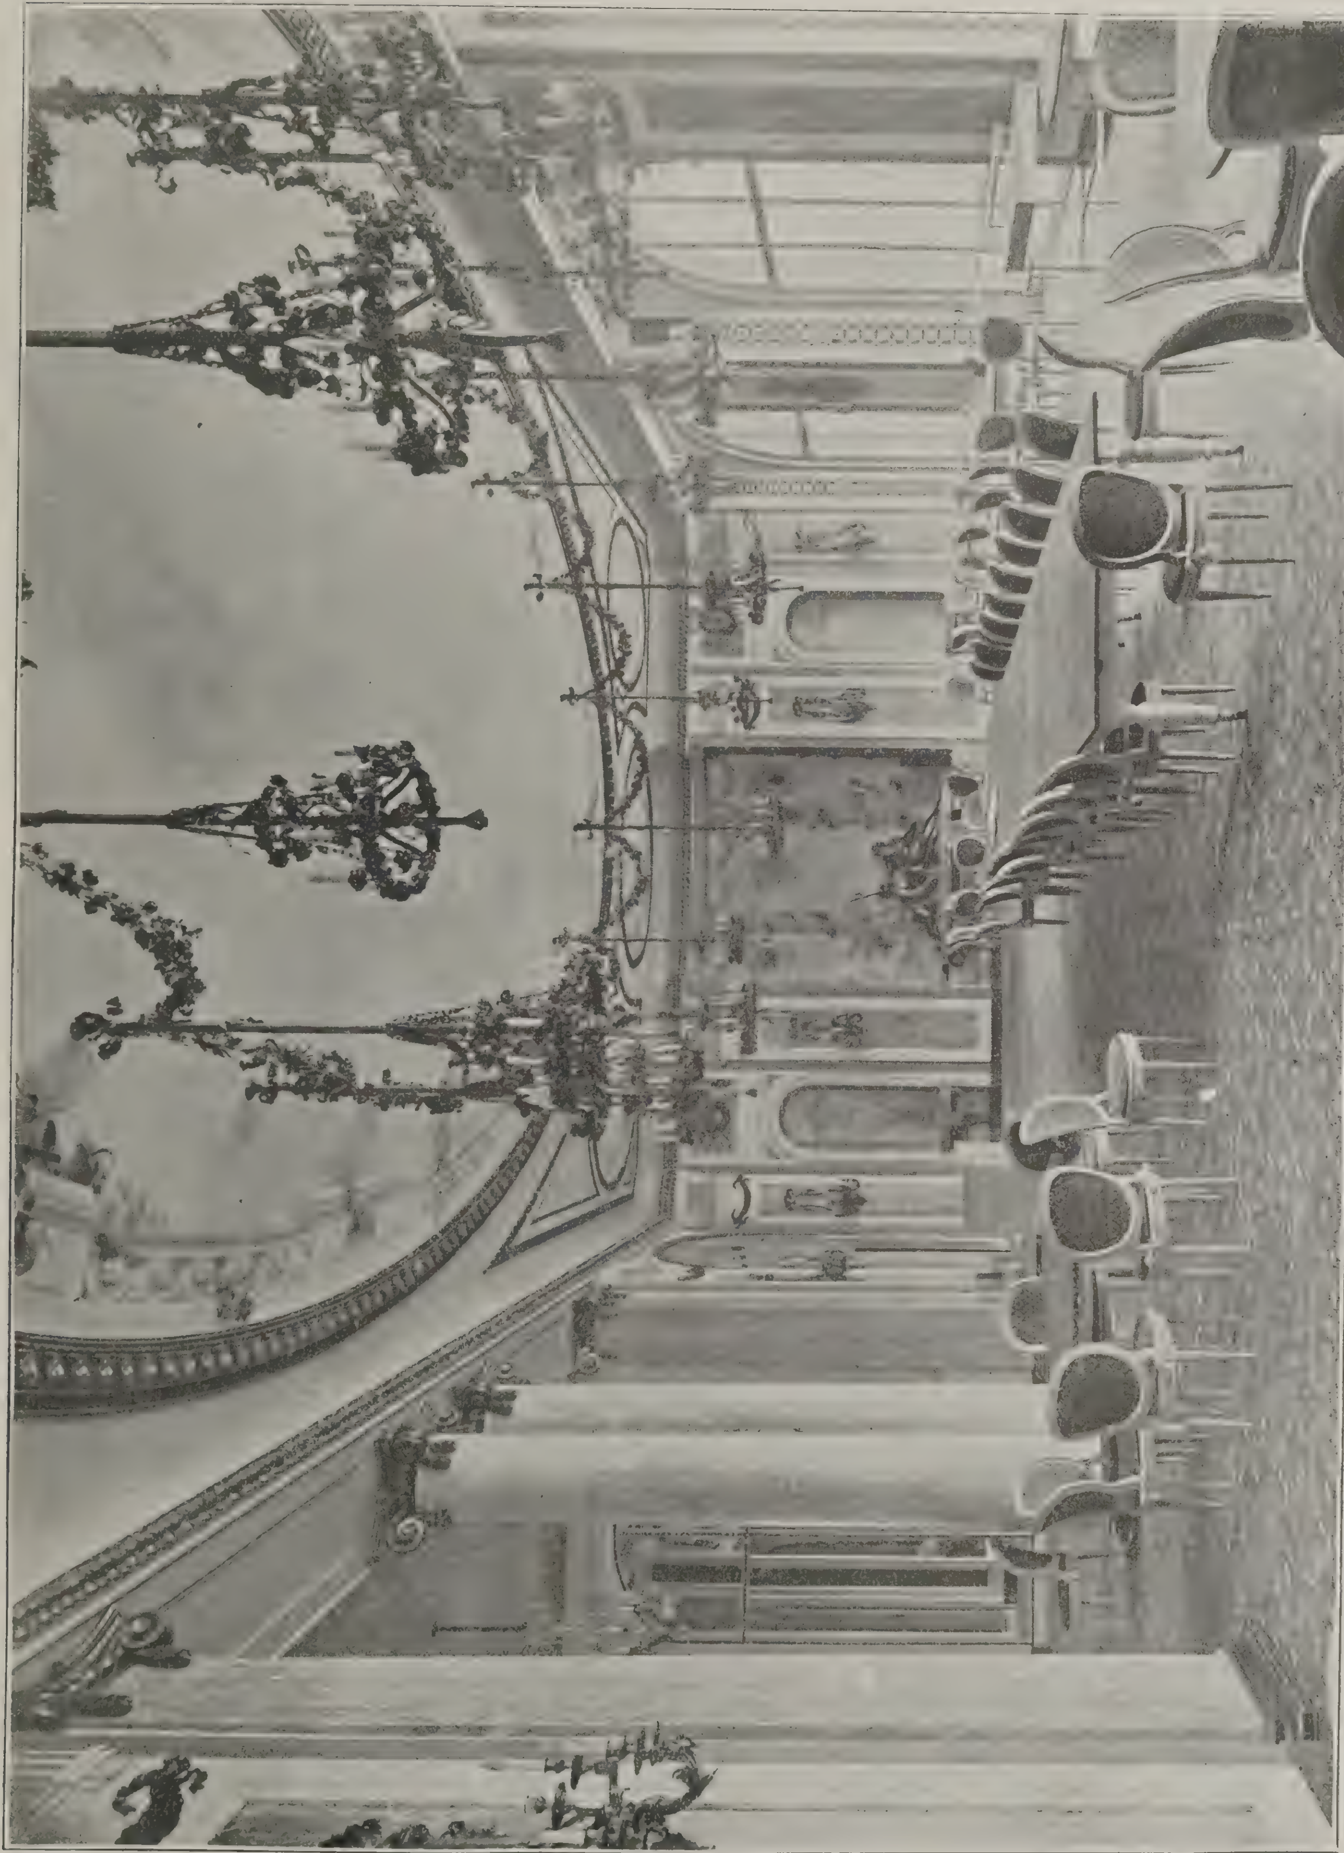
A notable feature of the exterior is the granite work, especially to the arcade on the Piccadilly front. It is carried out in Norwegian granite of the variety known as "Standard Grey," this granite having been selected on account of its excellent wearing qualities, good colour and regular surface. There are 17,000 cubic feet of this granite in the hotel, all of which was worked in less than five months and erected in the short space of twelve weeks. The keystones to the arches are embellished with carved heads, designed by a Parisian sculptor; these are very effective as executed. On the Green Park front of the hotel is a balcony over the restaurant, also carried out in granite, with strong corbels supporting it.

The system of carefully detailing the drawings in the case of the steelwork we have already referred to as facilitating the preparation of other work in advance, and the fact that the granite, like the steel, was worked abroad, led to drawings being carefully got out. We reproduce a portion of one of the drawings of the front to Piccadilly at the Arlington Street end, so as to show the general character. The dimensions were carefully taken from the architects' and engineer's drawings by Messrs. Manuelle, who submitted the detailed drawings to the architects for approval before sending them to Norway. The details were worked out from the $\frac{1}{8}$th scale elevations. The jointing was in great part left to the firm, who have a permanent representative at the quarry to check every measurement according to the drawings, and pass each block before shipment. The sections on this working drawing show the manner in which the backs of the blocks had to be cut out to fit round the steel stanchions.

MAIN STAIRS.



THE WINTER GARDEN



THE RESTAURANT.

The Ritz Hotel, Piccadilly, London. Mewès & Davis and John P. Bishop, Architects. Waring-White Building Co., Ltd., General Contractors. Waring & Gillow, Ltd., Decorators and Furnishers.

The small photographic view on page 3 shows such a block at the quarry placed ready for shipping. It will be seen how the back has been cut out. The casing is of course necessary to prevent damage. It is a point of interest in connection with this work that the difficulty that existed at one time with regard to the labour of carving granite is now in great part overcome by the adoption of pneumatic tools; the keystones were worked in this way, being finished however by hand. The granite employed for this building is peculiarly adapted to carving as it is easy in working and, consequently, economical and to be obtained quickly.

The Fire-Resisting Floors.

In these days of huge hotels where several hundreds of visitors are in residence daily, it is of the utmost importance that the building should be rendered secure against any possible danger from fires. Visitors to the Ritz, however, may reckon on immunity from any such danger, as every precaution has been taken in its construction to employ efficient fire-resisting floors and roofs.

The entire floors and roofs of this building have been constructed on the Columbian system of reinforced concrete, and are models of what floors and roofs for such a building should be.

Almost the whole of the floors at the Ritz Hotel were constructed before the outside walls were carried up, the very latest methods of construction being adopted to enable the building to be completed within a reasonable limit of time, and, although the contract was largely extended, the floors and roofs were completed well within the specified time.

The method of constructing the floors was to first erect centering between the girders carrying the span of floor and then suspend the steel bars between the girders by steel stirrups hung over the top flanges of the girders, the length of leg of stirrup being regulated so as to allow at least ¾in. thickness of concrete under the bars. The concrete was then filled in to the requisite thickness and tamped in position, the underside of girders being protected by slabs of concrete secured to the bottom flanges of girders with concealed anchors.

The Columbian floors at the Ritz Hotel are of what is known as "double construction," which is used when the ceiling is required to be kept at the same level throughout, or where a perfectly sound-proof floor is required. The rolled steel joists carrying the floors do not show below the ceiling line, but an independent ceiling is formed by laying 1in. Columbian bars on the lower flanges of the joists and embedding the bars and

CHIMNEY-PIECE IN SITTING ROOM.

THE BANQUETING HALL AND BALLROOM.

A BEDROOM.

bottom flange of joist in about $2\frac{1}{2}$in. thickness of concrete. The spans of floors so constructed do not usually exceed 7ft.

This form of construction is particularly suitable to such a building, combining as it does strength and fire-resisting qualities, and being also free from vibration and absolutely sound-proof. This last quality is by no means the least important, as it ensures freedom from the irritating noises commonly inseparable from buildings of this class. In addition to the above advantages, the double-construction floors have been employed at the Ritz Hotel as a ventilating agency, the foul air being carried into the space between floor and ceiling through inlets in the ceilings, and from there out into the open by air ducts. This space between floor and ceiling has also been used for the carrying of pipes, electric cables, &c., a slab being inserted in the floor to allow for easy access to pipes when required.

The Roofs

have also been constructed throughout on the Columbian system of reinforced concrete, and the adaptability of the system is well illustrated by the variety of windows, dormers, &c., in the roof.

Fireproof Partitions.

The fireproof partitions throughout the hotel are constructed of porous terra-cotta blocks, which are largely used in America in connection with steel-frame buildings, and have recently come extensively into use in this country. Hollow porous terra-cotta is an excellent material for interior walls for steel-frame buildings, by reason of its lightness and sound-proofness. The blocks are 12ins. square and of three thicknesses, namely, 3ins., $3\frac{1}{2}$ins. and 4ins., the 3in. being the size mostly used. Each block weighs 10lbs. They are very quickly erected, and are easily cut to fit corners or bends. At the skirting level blocks of a more porous or softer nature are used so that woodwork can be nailed to them. Each block has three air-spaces running through it. The partitions have been plastered with selenitic plaster and finished with Keene's. The setting-out of them, tried as an experiment, was done by the superintendent, the lines of the partitions being marked with a trowel upon a coat of rough plaster put on the concrete floors. This plaster set quickly, and the marks were then indelible and not to be obscured by traffic of men and barrows, as chalk would have been, thus facilitating the work and securing accuracy. These same partition blocks were also used as coverings to protect the steel columns, in case of fire.

Fire-Resisting Glazing.

On all floors in all the windows looking on to the five light-wells, including the windows to bedrooms, bathrooms, &c., fire-resisting glazing has been fixed; also in all the doors of the passenger lifts, all the doors opening on to the fire-escape staircases, the ceiling-light in the circular light-well, and in the doors and screens of the secondary staircases.

Asphalt.

The asphalt work amounted to more than 35,000 sq. ft. The roofs which were covered with asphalt present many features of interest, being at various levels.

The Decoration and Furnishing.

The whole of the internal decoration, furnishing and fitting has been carried out in the Louis XVI. style. The artists have been inspired by the works of De Neufforge, Boucher fils, and Lalonde, as well as by the prints of Moreau the younger and St. Aubin. The well-known firm of Messrs. Waring & Gillow have been responsible for the whole of the decoration and furnishing of the hotel, and the following is a summary of the chief points of interest in their so eminently successful work:—

Over the entrance to the hotel in Arlington Street there is a wrought-iron marquise, shown on page 1. This leads to the Grand Gallery, at the Green Park end of which is the entrance into the Restaurant. On the right and left of the Restaurant entrance are placed two life-size figures in bronze vert, after Clodion, holding gilded bronze lustres with six lights each, and mounted on pedestals of polished Echaillon stone, ornamented with bronze.

To the right of the entrance to the Restaurant is a private dining room called the Marie Antoinette Green Room.

The Grand Gallery itself, which runs the full length of the hotel from the entrance of the Restaurant, is vaulted and built of stuc pierre relieved by massive gilt bronze fittings, balustrades and doors, and forms a pleasant lounge. The floor of this Gallery is carpeted with specially made hand-woven "Savonnerie" carpets.

The Winter Garden, which lies to the left of the Grand Gallery at the back of the site, is divided from the Gallery, as shown in one of our views, by two Ionic columns. The decoration is rich; the walls are faced with greyish white Echaillon stone, surmounted by a rich cornice, while the glass roof is supported by a

A BATHROOM.

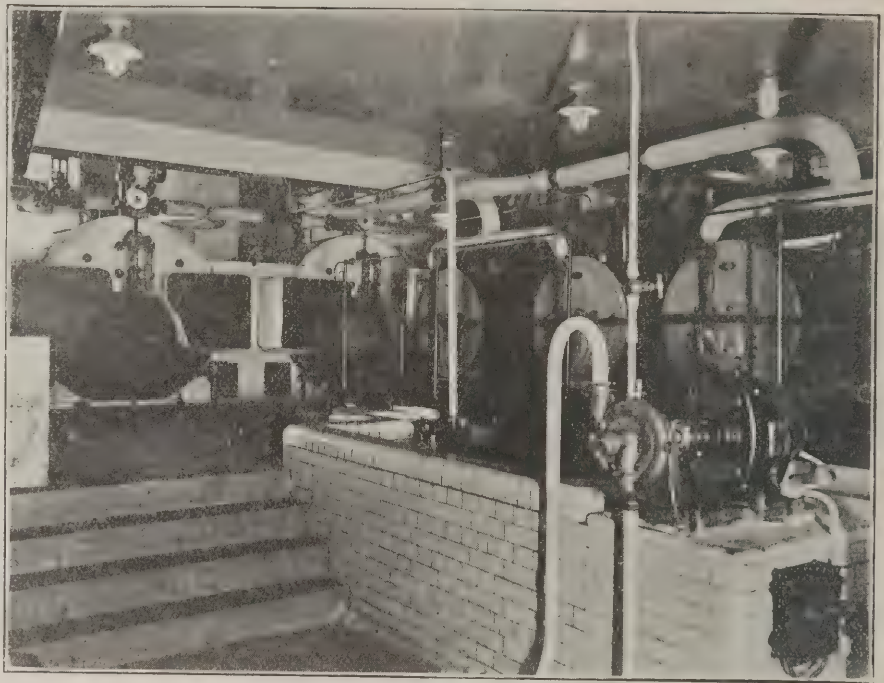
wrought-iron framework, from which depend two lamps in the same metal, gilded and adorned with painted foliage and flowers. Above the cornice is a gilded trellis-work in eighteenth-century style. There are two large panels of twenty bevelled mirrors framed in gilt bronze. In the middle of the wall opposite the entrance is a decorative niche surrounding a Louis XVI. fountain, formed of rocks and allegorical figures. This fountain is in Echaillon stone with figures and ornaments in gilt repoussé lead, the subject being "La Source."

The Restaurant is also richly decorated, as will be seen from our view. The mural decorations are inspired by the works of De Neufforge, and the famous print, "Le Bal Paré et Masqué," by St. Aubin, has been followed for the lustres. Preceded by an atrium, the Restaurant forms a large square, in which 150 persons can dine.

The side of the Restaurant looking on the Green Park is composed of five large bay windows in the form of an arcade, in the bronze work of which are inserted *glaces sans tain*. Thus from every part of the room one has a pleasing perspective on the scenery of the Green Park. These bay windows, which can be turned back, lead on to the terrace, at the extreme right of which a staircase of twelve steps takes one to a garden, which is on a level with the Green Park. The ceiling is handsome, its chief feature being the painting of a blue sky with light clouds, which is surrounded by an oval gilt frame, and depending from it are the lustres, joined by garlands in gilt bronze.

The Marie Antoinette Room is decorated in the purest Marie Antoinette style, in green and gold, with panels framed in carved gilt wood.

The banqueting hall, reception rooms and private dining gallery in the basement —reached by a special staircase—are to be used for dinners, receptions and theatrical entertainments (a raised stage is fitted at the south end of the banqueting hall). The general decoration of these apartments is ivory white, and the dining gallery is fitted with mirrors, suggesting a series of intersecting vaults.



BOILER·HOUSE IN BASEMENT.

As regards the bedroom floors, each suite of rooms is differently decorated although the general scheme is the same; that is to say, the walls are painted and panelled in white, and the floors are covered with green and rose-coloured Persian carpets.

Plastering.

The plastering contract was an important one, running into several thousands of pounds, and it had to be executed with unusual skill and care on account of the nature of the decorations; moreover, time was a factor that had to be considered, as it was important that the opening of the hotel should not be delayed. Enquiry elicits the fact that this part of the work was done considerably under contract time, as in the case of the Carlton Hotel, also plastered by the same firm.

Viteous Tiling.

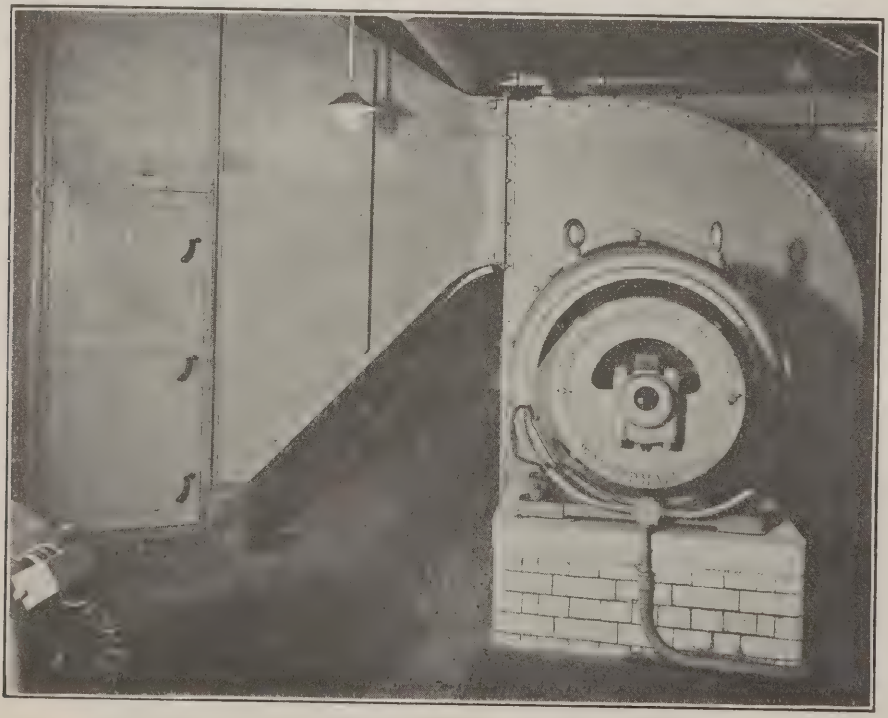
The greater part of the walls of some seventy-five bathrooms, lavatories, &c., are lined from floor to ceiling with vitreous tiles. White tiles with grass green frieze and skirtings of the very simplest patterns are used, but the whites are in some cases tinged slightly with pink and in others with green, thus giving a most artistic opal effect to the whole, whilst still retaining the severity of treatment which is so suitable to bathrooms, &c. These tiles seem to be growing greatly in favour with some of our best architects, and there is no doubt but that their absolute impermeability, excessive hardness, rich variety of colour, slightly matt surface and general artistic possibilities render them quite distinct from any other form of tiling on the market.

Locks.

The lock equipment of the hotel is entirely different from any other ever before furnished. All the locks are controlled by a grand master key, and each floor is in turn controlled by a separate sub-master key (chambermaid's key), each lock being different and controlled by its own change key (guest's key). Owing to the special features encountered, the locks were made for extremely narrow-stile doors and are operated by lever handles. Some locks are made with a double backset—that is, a keyhole on one side 1in. from the edge of the door, and on the other side 2ins. from the edge of the door. A special lock was constructed for the suites of apartments. When the lock is used on a door which leads to a sitting-room, the guest is able to actuate the lock by a lever handle on either side, but when it is used as a bedroom, by rotating the plug in the Yale cylinder in front of the lock, the outside lever handle is then fixed.

Heating and Ventilation.

The heating and ventilation is on the plenum system and has been designed by Mr. E. Wingfield Bowles, the consulting engineer to the hotel. The fresh air is driven into the building by means of a cased fan direct-coupled to two 25-b.h.p. electric motors dealing with over 1,000,000 cub. ft. of air per hour, or 6,700ft. per minute. Before being distributed to the various parts of the building this large



THE VENTILATING FAN.

volume of air is thoroughly washed and filtered, and is then perfectly free from fog particles, dust and other foreign matter.

In the winter the air is warmed by being driven through a steam battery, so arranged that the temperature can be accurately regulated according to the condition of the weather. By an ingenious arrangement of shutters and ducts with himidifying chambers, air of varying temperatures and humidity can be distributed through the network of air ducts to every part of the building. Thus while cold air is being driven into the kitchen, cool air slightly moistened can be delivered to the ballroom, warm air to the restaurant and winter garden, and air of another temperature to the sleeping apartments and sitting-rooms if required.

The vitiated air is carried away from the various rooms and corridors by three large electrically-driven fans capable of dealing with three-and-a-half-million cub. ft. of air per hour. The air inlets and extracts are arranged so that there is an entire absence of draught or noise due to the movement of such large bodies of air.

In the warm weather, in addition to the filtering screens, a spraying apparatus is utilised to cool the air as it enters the the building.

Water supplies are pumped up from the main intake tanks by two electrically-driven lift and force pumps capable of dealing with 80,000 gallons per 12 hours. Storage tanks for 20,000 gallons of water are arranged in the towers at each end of the building.

There are hot-water services from steam-heated calorifiers, which supply 6,000 gallons of boiling water per hour, and a complete system of fire services and hydrants and fire extinguishers on all floors, and a vacuum main, with connections, to all parts of the building.

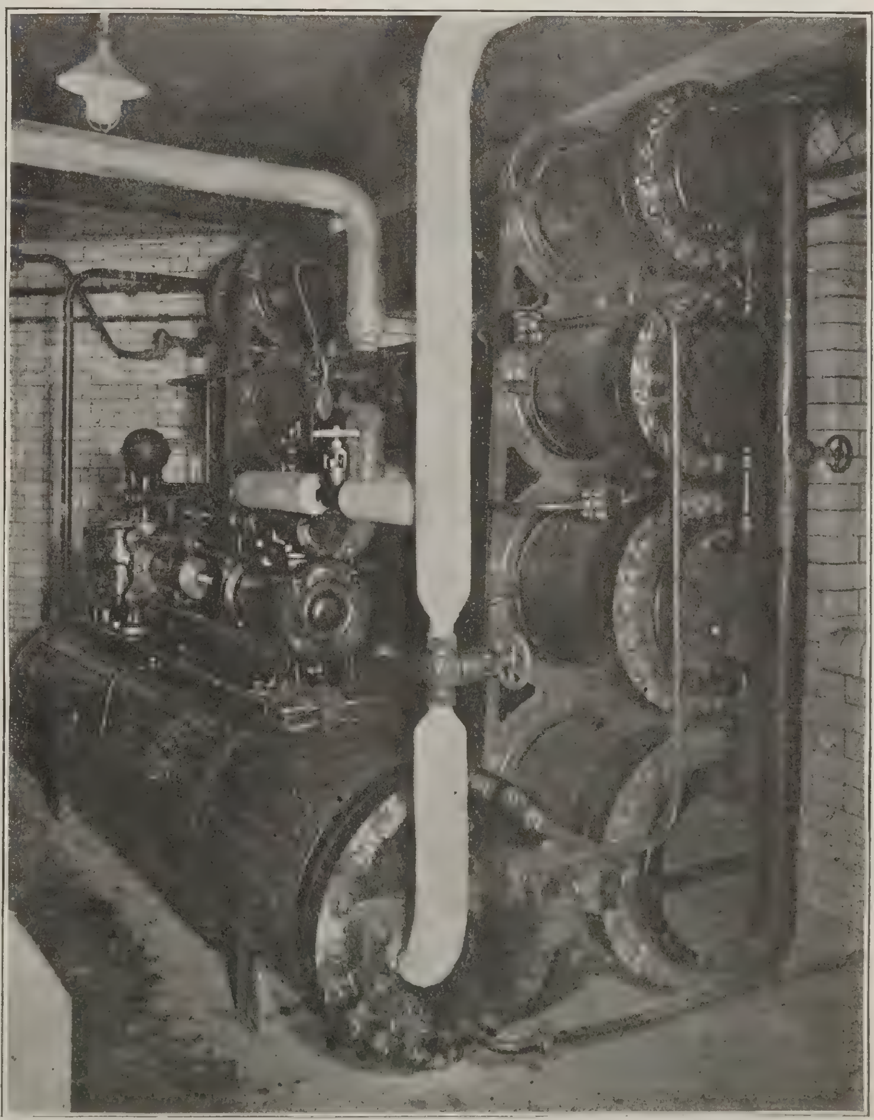
Boilers.

There are two steam boilers, each 12ft. 6ins. long by 6ft. 6ins. diameter, of the Economic type with one internal furnace tube and fifty smoke tubes extending the whole length of the boiler. From each boiler a steam service is carried off with connection on to a 4½-in. ring steam main so that either boiler can supply either side of the steam main. The two boilers are fed by means of duplicate-feed water pumps with duplicate-feed service pipes, and so arranged that either pump will serve either boiler.

The Kitchens.

The kitchens are marvels of the cooking apparatus manufacturers' skill and ingenuity. There is a large roasting range, 7ft. 6ins. high and 4ft. wide, fitted with a 30in. fire and electrically-driven jack and spits, which is capable of roasting a baron of beef or a quail. There are two large central cooking ranges and one side range with tiled canopies over; steam vegetable cooker containing twelve compartments, steam boiling pans for soup, a double charcoal grill, two salamanders, stock-pot stands, etc. There is a combination of eleven steaming closets fitted with gunmetal mounts; a series of thirteen hot closets for the serving rooms, seven being 5ft. by 4ft., five 6ft. by 4ft., and one 6ft. by 6ft. —all fitted with perforated shelves having wrought-iron steam coils and steam inlet valves, polished mouldings and wrought-iron sliding doors with gunmetal sunk handles; a combination of three serving tables and hot closets occupying nearly the full length of kitchen, about 50ft. long, heated with steam coils; a gas-heated stock-pot stand 4ft. long, 2ft. deep and 18ins. high; a gas boiling table 8ft. long, 3ft. 3ins. high and 2ft. 6ins. wide; gas toasters; central gas range; gas grillers, &c.

THE MAIN KITCHEN.



THE REFRIGERATING PLANT.

The range of steam-heated serving tables, a good view of which is shown on the preceding page, is said to be the longest in the world.

The Still Room

is fitted up with gas boiling tables, toaster for 100 rounds, automatic egg boilers, and long steam-heated serving table.

In the Bakery

a specially designed bread oven is erected in which the whole of the bread used in the hotel is baked at an expenditure of fuel of about 6d. or 7d. per day.

A similar oven, but designed for pastries, is built in

The Patisserie,

which is also fitted up with boiling ranges with specially designed concentric burners for chocolates and sweets.

The Twelve Serving Rooms

are each fitted up with steam hot-cupboards and all accessories.

Cold Storage Accommodation.

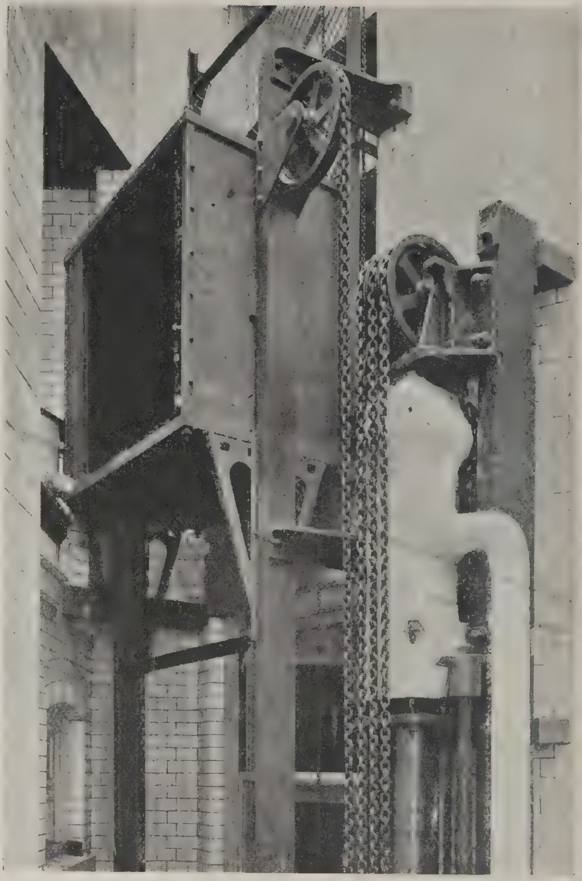
The cold storage accommodation comprises two large chambers for preserving meat, game, &c.

The distilled water ice-making, cold storage, and refrigerating plant is very complete. The plant consists of one of ammonia absorption machines, fixed in the lower basement, from which cold is distributed by means of brine, pumped through mains running through the entire length of the building by motor-driven centrifugal pumps, two being supplied in duplicate for this purpose, one as an auxiliary. The brine is cooled in a brine cooler placed by the side of the machine, the whole forming a very compact plant, and occupying very little space.

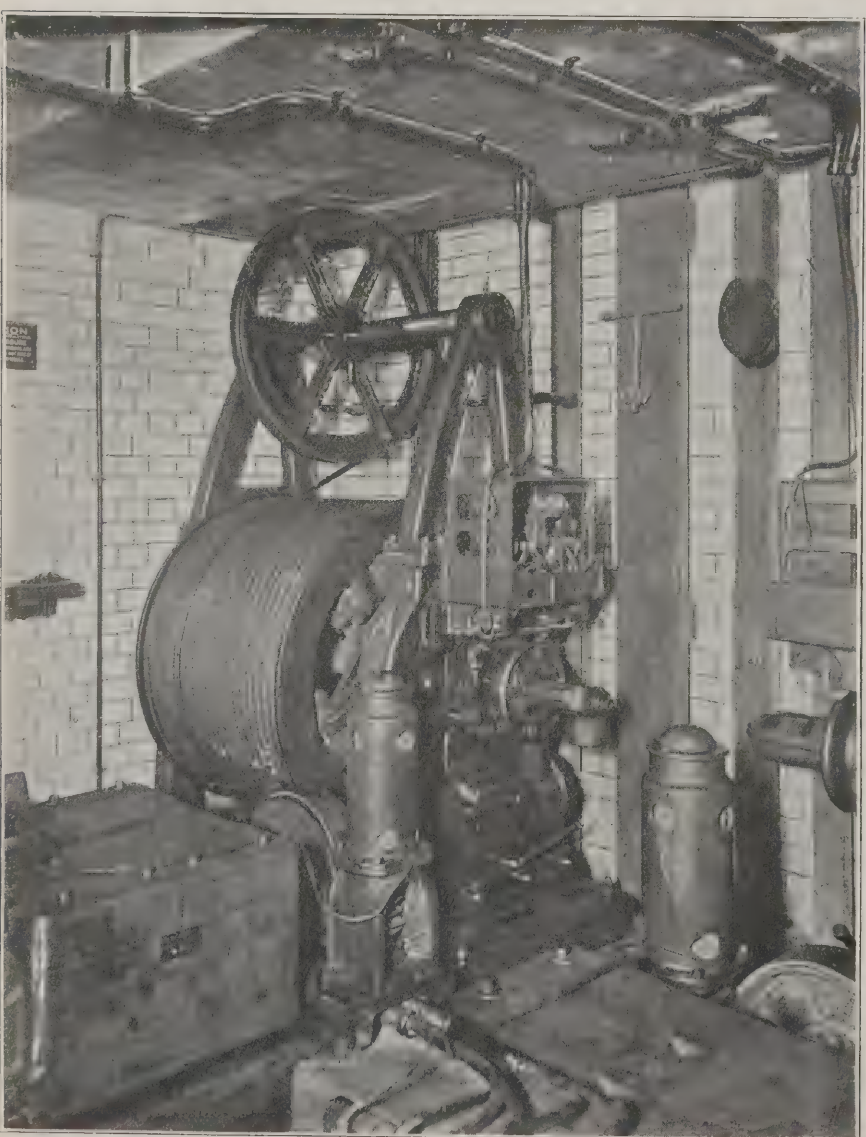
In addition to ice-making, the plant is used for cooling two large meat and game chambers; several hotel service cupboards; wine, beer, and mineral water coolers; and appliances for cooling drinking water. The two principal meat and game chambers are each supplied with their own air-cooling appliances, the air being circulated by means of motor-driven fans.

Sanitary and Plumbing Work.

The sanitary and plumbing work has been most successfully carried out, and as a specimen of modern up-to-date sanitary engineering will bear comparison with anything yet accomplished. Everyone now recognises the importance of efficient sanitary work, and this feature has been kept continually in view during the construction of the hotel. The building contains nearly 100 bathrooms and lavatories, luxuriously fitted up, besides staff accommodation. The ornamental leadwork on the roofs and dormers is also worthy of note, especially the covering of the stone carvings over the dormer windows, &c.



A KITCHEN LIFT.



ELECTRIC LIFT WINDING GEAR.

The whole of the sanitary fittings are of special design. The lavatories and baths are in white glazed fireclay, and the closets, a new pattern with valve, designed so as to be fixed without any enclosure. There is a bath, lavatory and closet to each suite of rooms.

Lifts.

The lift installation comprises two electrically-controlled passenger lifts, running one alongside the other in one shaft; one waiters' passenger elevator; one luggage elevator; three hydraulic goods elevators; and five push-button controlled electric dinner or service elevators equipped with electric floor position indicators.

Contractors and Sub-Contractors.

General Contractors - -	Waring White Building Co. Ltd.
Decoration and furnishing	Waring & Gillow, Ltd.

The following is a list of some of the sub-contractors who executed work at the hotel:—

Fire-resisting glazing	British Luxfer Prism Syndicate, Ltd.
Sanitary and plumbing work	Mellowes & Co., Ltd.
Lifts - - - - -	Otis Elevator Co., Ltd.
Plastering - - - -	Danville Asbestic Plastering Co.
Refrigerating machines and ice-making plant	Ransomes & Rapier, Ltd.

The Increase in Building Accidents. In the annual report of the Chief Inspector of Factories and Workshops for the past year, just issued, it is stated that, despite the facts that machinery is better fenced year by year, and that more precautions are taken, the number of accidents increases. Last year, in various parts of England, there were no fewer than 540 accidents with circular saws, 749 with cranes and lifting tackle, 195 with planing machines, 152 with hoists, and 36 with band saws. There are no figures given which enable one to determine exactly what class of building work has been most responsible for accidents, but on jobs it is evident that the hoisting of materials—stone, steelwork, &c.—embraces a large proportion. This, however, is not a necessary counterpart to the modern methods of erecting buildings. It is true that in cities nowadays a great rush goes on, with the object of getting the work completed at the earliest possible date, and that this rush entails many accidents: nevertheless, the fault is very often with the workmen themselves. Brick hoists, for instance, which are expressly stated on notices to be used for material only, will be used by workmen to save them the trouble of going up the ladder: with the frequent result that the hoist is overloaded and runs down, with perhaps fatal consequences. Then, again, it is not so uncommon to see men standing on cages or slings for material being lifted by the crane, airily waving their arms to the crane-man—a piece of sheer foolhardiness. In the Chief Inspector's report above referred to, Mr. Hoare, of the West London division, points out that there is a disposition to begin to remove scaffolding before the work on a section is complete, so exposing men doing touching-up work to unnecessary risk; though he adds that the scaffolding in large places in London always appears to be well done. Mr. Beverley, of the West London division, refers to the two cases of the failure of large Scotch cranes at work on the top of new theatre buildings. In both cases the injuries were fortunately not of a fatal nature. In the first case the main or king post of the crane came clean out of its socket. Either the bed-plate casting broke or, what seems more probable, the cotter holding the top ends of the posts together got loose and jumped out, as it was afterwards found in the débris. In the second accident the jib of the crane broke in half and fell on the look-out platform, knocking the man on to scaffolding 10ft. below. "Builders have a way of guessing the loads to be lifted. This is all very well with a small rectangular object, but when the material weighs several tons and varies in shape it should be measured up each time. Cornice stones are generally some of the heaviest loads to lift and here the variations in the mouldings alter the weight. At an inquest as to an accident caused by the collapse of a crane the builders' foreman said he got the weight of girders by measuring them, but, on being pressed, admitted he usually guessed them." There is indeed too much of this guesswork going on. Things are not properly tested at regular intervals, as they should be. When an accident occurs, this fact is elicited, and then the jury adds a rider, enforcing the obvious. The matter, however, drops out of notice without anything being done. Mr. Walmsley, of the East Cheshire division, reports the unusual accident (fatal) of the bursting of a circular saw. This saw was 36ins. diameter, driven direct from a motor. It was making 1,800 revolutions per minute, or a surface speed of three miles a minute, and it burst suddenly, throwing a piece to a distance of 300 yards. No flaw could afterwards be found in the pieces, and the only inference is that the saw had been overdriven.

The Congress. The Seventh International Congress of Architects is now in full swing, dividing its labours with its pleasures. Maybe (and we have more than a suspicion of it) the pleasures count first, and the commendable discussion on eclectics of architecture (commendable from a professorial standpoint) is not so much a feature to be remembered as the conviviality among architects of all countries, whether it be in the official purlieus of Conduit Street, the more æsthetic region of the Grafton Galleries, or surrounded by the glorious hospitality of the City's halls. Moreover, at this time of year, we have little doubt the excursions to our English beauty spots and centres of old architecture will hold the field against any academic meetings in the West-End. And we need not cavil about it. Our foreign friends have come here to see our buildings, old and new, and to meet our architects of most repute. In this respect the exhibitions of the Congress have a relative interest, and it is valuable to have a record of them. There are many publications in connection with the Congress, but by far the most interesting is the special number of The Architectural Review dealing with the exhibitions—a volume of illustrations of old and new architecture, with commentary articles by the best authorities. It is really a remarkable issue of the Review, an issue to be kept, as it brings together a collection of photographs never before attempted; it is, presented, too, in the best manner of the modern Press.

STRENGTH OF BRICKWORK AS DETERMINED BY EXPERIMENT.*

By W. C. Popplewell, M.Sc.

The object of this paper is, in the first place, to describe the manner in which experiments on the strength of brickwork are carried out in the materials testing laboratory of the Manchester School of Technology; secondly, to indicate the kind of results which are to be expected from these; and, thirdly, to quote several of the more important of the data which have been obtained here and elsewhere.

Testing Machine and Measuring Apparatus.

The machine used for making tests of brickwork and similar materials is a 900-ton hydraulic press, having a 20in. ram. In this machine the pressure of the water above the ram is shown on a pressure gauge. In order to allow for the effect of the friction of the cup leather, the weight of the ram and its attachments, and the upward pull of the side pistons which are used to lift the ram, a direct calibration has been made by which the load on the specimen can be calculated directly from the pressure, with a very fair degree of accuracy. The formula made use of is

$$W \text{ (tons)} = (p \text{ (lbs.)} - 34)\ 0{\cdot}139.$$

This formula has been obtained by means of a steel spring piece which had first been loaded in the Wicksteed testing machine. In this way the load in tons on the specimen can be obtained directly from the pressure in pounds per square inch.

The compressions corresponding to the loads are obtained by means of a Martens mirror apparatus. In this instrument changes of length of the specimen which is being loaded cause the rotation of a mirror, and the reflection of a graduated scale in this mirror, as seen through a telescope, is caused to appear to move across a fixed line in the diaphragm of the telescope. The difference in the position of this line on the scale is a measure of the change of length between two points a fixed distance apart. In the experiments here referred to two mirrors were used, placed on opposite faces of the pier, so as to indicate any inequality in the stress. The readings were taken on a length of 20 c.m. on the face of the brickwork, and readings could be read directly to 1-10,000th of an inch, and by estimation to 1-50,000th.

Tests with Piers.

The experiments which have been made include tests of piers of brickwork, tests of the bricks of which the piers were built, and tests of the mortar used.

All the piers tested have had a square section, 18ins. by 18ins., giving a sectional area of 2¼ sq. ft. Those tested up to the present have been 36ins. high, but three which have recently been built are 48ins.

The building of the piers has in all cases been carried out by working bricklayers. Some have been built in place on the lower platen of the machine, while others have been built on stiff squares of timber and moved into the machine when ready for testing. In all cases the top and bottom surfaces of the piers have been set either in neat Portland cement or in plaster-of-Paris, in order to distribute the load uniformly. This is an important point, and seriously affects the results of the experiments.

The various piers tested up to now include the following:—

One of common local wire-cut bricks, with lime mortar.
One of common local wire-cut bricks, with Portland cement mortar.
One of Accrington, with black mortar.
One of blue Staffordshire, with Portland cement mortar.
Six of blue brindled Staffordshire, with
  2 black lime mortar.
  2 Portland cement mortar.
  2 lias lime mortar.
Five of Accrington, with
  1 Portland Cement 1 to 1.
  1 ,, 2 to 1.
  1 ,, 3 to 1.
  1 ,, 4 to 1.
  1 ,, 5 to 1.

At first no special plan was adopted so as to systematise these tests, but now, for any set of piers built and tested, the idea of obtaining information on specific points is kept in mind. To the above must be added three piers recently built, but not yet tested. These are: One of blue Staffordshire, with Portland cement mortar 1 to 1; one of 2nd Accrington, with Portland cement mortar 1 to 1; one of 2nd Accrington inside, and faced with blue Staffordshire with Portland cement, with mortar 1 to 1. In the case of these last, the height is 4ft. instead of 3ft. Thus in all there are 18 piers, 15 of which have been tested.

The result of the first 15 tests have been already published and discussed in a paper published in the "Proceedings" of the Institution of Civil Engineers, clxi.

Relation of Stress and Strain.

The measurements taken with the Martens apparatus make it possible to express a relation between the stress and mean strain at any period of the loading.

This relation is conveniently expressed by a plotted stress-strain curve, which is similar to the curve obtained on the first loading of any material having the nature of soft stone, or mortar or concrete in which portions of a harder substance are set in a matrix of a different substance which is generally soft in nature.

This diagram may be divided into three portions:—

(*a*) There is a curved portion with the concave part upwards. This indicates a diminution of strain as the loading progresses, which may be caused by the spaces between the particles which form the substance being closed up.

(*b*) The second part of the diagram is straight, thus pointing to an elastic condition of the substance. This elasticity is not quite perfect, as there is generally found a little permanent set on the removal of the load. It is further found, when the specimen has been loaded and reloaded once or twice, that the permanent set is almost completely eliminated. From the readings taken during this part of the loading it is possible to calculate a value of Young's modulus (E). For the best kinds of brickwork (E) has been found to have an average value of about 125,000 tons per sq. ft., or 1,940,000lbs. per sq. in. This may be taken to mean that for the application of a stress of 1 ton on each square foot a wall or column of brickwork will be shortened 1-125,000th of its height. For example, in the case of brickwork 100ft. high, loaded with 12½ tons in each square foot, there would be a shortening, apart from its own weight, of 1-100th of a foot, or about ⅛in.

(*c*) At the end of the straight portion the line again becomes curved in the opposite direction from that of the first part. This indicates a growing increase of compression, and marks the end of the elastic condition. If the terminology used in the case of iron and steel be employed here, the point where this last curve begins may very well be called a "limit of proportionality" (P. limit). What is happening in the material after this point is passed is not very clear, but it may be thought probable that the particles, which, up to this point, have retained nearly the same relative positions, are being pushed further out of their places and a sliding movement is beginning to take place. It is very likely that this movement takes place first in the motar, and when this begins to move and fail, the even distribution of the stress on the bricks themselves must be changed, with the result that these begin to crack, and a general movement begins to take place throughout the brickwork.

Effect of Successive Applications of Load.

If a loading is carried just beyond where it has been called the proportional limit, the load removed, and then again applied, it is found that the measurements taken during the second loading plot on a straight line up to where the previous loading stopped. It would seem that the effect of the first loading is to press the particles permanently nearer together. The result is very like what is found to take place in similar experiments on some of the metals.

Cracking and Crushing Stresses.

In compressive tests of brickwork it is usual, apart from the elastic measurements, to observe and note the stress at which the first crack is seen or heard, and to call this the "cracking stress." The next and the last point reached in the loading is the "crushing stress," which is the maximum stress supported by the brickwork, and at which the material is completely broken up.

That final failure takes place by sliding on planes which are inclined to the axis is shown by the fact that the pier finally breaks up into what are, roughly, two pyramids, just in the same way as is seen in the case of stone, cement, and concrete.

Effect of Mortar on Strength of Brickwork.

The five piers whose results will now be given were prepared and tested with the idea of finding out to what extent the strength of the brickwork is dependent upon the strength of the mortar. Five piers were built, one kind of brick being used throughout. These were Accrington (Huncoat plastic), with panels on both faces.

On testing three of these bricks for crushing strength it was found that they crushed at an average value of 388 tons per sq. ft. These bricks were tested whole, and were bedded in plaster-of-Paris when set on their proper bed. Cement mortar was used throughout, the proportions of sand to cement being different for each of the five piers. These proportions were respectively 1 to 1, 2 to 1, 3 to 1, 4 to 1, and 5 to 1. The mixing of the mortar and the building of the piers was carried out, as in the previous tests, by a working bricklayer. The tests were carried out as described above, the Martens mirrors being used, and each column was loaded about seven times. The first loading was taken up to 16½ tons per sq. ft., and each successive loading was about 13½ tons per sq. ft. higher, elastic readings being taken throughout. It is worth noticing that in spite of the great care taken to distribute the stress uniformly on the top faces of the piers, the observations showed there was always a greater intensity of stress on one face than on the one opposite; this

---

* A paper read at Manchester before the Summer Meeting of the Institute of Sanitary Engineers on July 6th, 1906.

TABLE I.

Results of tests of five brickwork piers, 1½ft. square and 3ft. high, made of Accrington bricks and Portland cement mortar. Tested about six weeks after building.

Mortar used: Sand. / Cement.	Prop. limit last time of loading.	First crack.	Crushing.	Ratio— Strength of brick. / Strength of brickwork.	Strength of mortar.	
					At seven weeks.	At twenty weeks.
	Tons per sq. ft.				Tons per sq. ft.	
1—1	85	97	125	3·1	79	98
2—1	80	91	159	2·4	32	51
3—1	78	79	125	3·1	27	28
4—1	72	90	116	3·3	20	24
5—1	72	69	125	3·1	16	18

TABLE II.

Brick.	Mortar.	Age. Weeks.	Cracking.	Crushing.	Ratio— Brick. / Brickwork.	Mortar crushing.
Common wire-cut ...	Sand and lime	4	35	53	5—1	—
Common wire-cut	3—1 Portland cement	39	64	84	3·1—1	—
Accrington...	black lime	4	78	96	2·6—1	—
Blue Staffordshire	3—1 Portland cement	39	69	98	3·6—1	—
Brindled	black lime	12	100	165	2·9—1	31·8
Brindled	black lime	26	110	185	2·6—1	31·8
Brindled	3—1 Portland cement	12	132	169	2·9—1	10·0
Brindled	3—1 Portland cement	26	90	161	3—1	10·0
Brindled	lias lime	12	38	119	4·0—1	very poor
Brindled	lias lime	26	41	102	4·7—1	soft and crumbly

excess was found to vary from 10 to 34 per cent. The chief results are given in Table 1.

The mortar was tested in the form of cubes of 4in. side.

An inspection of these results shows the crushing strength of the mortar to diminish as the proportion of sand increases; also, the strength increased with age. These results are both what one would expect them to be. It will be noticed that only the crushing strength of the mortar is given, as it is found that in tests of this kind the cube collapses very soon after the first crack is seen.

In the case of the brickwork itself, the data obtained are, first, the proportional limit as found from the last set of readings taken in the case of each pier. These agree fairly well with the order of merit of the mortars, though there is far less difference than in the case of the mortars themselves.

In the next column are the stresses at which the first crack was detected. The author thinks this the most reliable criterion of the strength of brickwork, because it marks the point where the stress is beginning to cause internal movement of the material. The same order is maintained, though an exception is to be seen in the case of the 4 to 1 pier. This is probably due to a want of alertness on the part of the observer, whose duty it was to look out for the first crack. The "crushing stresses" in the third column do not appear to follow any particular kind of order, except that the aggregate of the first two is greater than that of the last two. This crushing or collapsing load is always found to be uncertain, and where several piers which are supposed to be precisely similar are tested there may be found to be considerable difference in the final loads, although the cracking points are near together.

It may be well here to quote some of the results of previous experiments in the testing laboratory of the Manchester School of Technology (Table II.). These piers were all 1½ft. by 1½ft. by 3ft. high. The stresses are given in the same units as in the last table.

To these may be added a few results recently selected from those published by the Royal Institute of British Architects.

TABLE III.

Strength of Brickwork, R.I.B.A. experiments.

Brick.	Mortar.	Workmanship.	Crushing strength. Tons per sq. ft.
Blue Staffordshire	Lime	Average	74
,, ,,	,,	Good	114
,, ,,	Portland Cement	Average	77½
,, ,,	Portland Cement	Good	119

In the second table it will be seen that there is a set of piers of Staffordshire blue brindled bricks, which were made in pairs, having different mortars. The second of each pair was twice as old as the first. If the cracking stress be taken as the criterion of strength, it will be seen that there is not a very great deal of difference between the strength of the lime mortar piers and the cement mortar piers, except that the cement mortar fell away in strength while the lime mortar improved with age. Whether this increase of strength would have been maintained if the second piers had been kept longer it is impossible to say.

The difference between the first four and the last two is, however, very marked. This last pier, built with lias-lime mortar, was evidently very bad. It is probable that the mortar was used too long after mixing, when it had become partially set. There was no hardening of this mortar, which could be easily crushed between the fingers, and the effect is seen in the strength of the brickwork, which is lamentably weak as compared with the first four piers of this set. This may be taken as one example of the influence of the mortar on the strength of the brickwork. The other may be taken from the results of the series given on Table I., already referred to. The five mortars used in this set have a gradually increasing ratio of sand to cement, and the results of the tests of the mortars show a corresponding decrease of strength with the increased amount of sand. The brickwork strengths also show a decrease, but not so marked. The strengths of the mortar cubes are approximately in the order: 500, 200, 160, 120, 100, while the brickwork strengths are as 140, 139, 110, —, 100.

It is quite possible that if the mortar had been tested in thin flat slabs instead of cubes the results would more nearly accord with the brickwork.

Working Loads on Brickwork.

There is not a great deal of information published regarding the safe loads that can be applied to brickwork, but from what can be ascertained, the following loads, expressed in tons on the square foot, are often used.

Brick.	Mortar.	Workmanship.	Safe stress. Tons per sq. ft.
Ordinary	Lime	Average	5
Best red	,,	Good	8
,,	Cement (2—1)	Best	10

A case is quoted of a chimney in Glasgow, where the stress is 9 tons per sq. ft. in still weather, and as much as 15 on the lee side in a gale of wind. In the light of the results quoted here it would appear that the loads usually applied to brickwork are amply safe in most cases. In forming an estimate of the probable strength of any particular kind of brickwork, it is not sufficient to be guided by the names of the materials alone, but to have an intimate knowledge of their quality and the manner in which they are used.

The experiments in the Municipal School of Technology, of which the results have been quoted, were made in connection with the teaching work of the school and the greater number of the observations were taken by the students. It would have been impossible to carry out these somewhat costly experiments if it had not been for the apparatus and material provided by the Education Committee of the Corporation of Manchester, to whom the author wishes to take this opportunity of acknowledging his indebtedness.

Engineering Standards Committee. — Mr. Edward P. Martin, president of the Institution of Mechanical Engineers, has been appointed one of the representatives of that institution upon the Main Committee of the Engineering Standards Committee in place of Mr. E. Windsor Richards, past president of the Institution of Mechanical Engineers, who has retired.

Garden Suburbs at Birmingham. — The Birmingham Corporation have adopted a scheme for the establishment of garden suburbs on the lines of those which exist in Germany. The council propose to obtain power to forbid the erection of any new buildings except in accordance with a general plan for developing all uncovered land within the city boundaries.

THE INTERNATIONAL CONGRESS OF ARCHITECTS.

The seventh International Congress of Architects is being held in London this week. On Monday morning there was an informal reception at the Grafton Galleries by Mr. John Belcher, A.R.A., president of the Royal Institute of British Architects. A meeting of the International Permanent Committee was afterwards held, when the chairmen and hon. secretaries for various sittings of the Congress were appointed.

The Official Inaugural Ceremony

took place at the Guildhall in the afternoon. H.R.H. Princess Louise and the Duke of Argyll having been received by the Executive Committee and the Ladies' Committee, the chair was taken by the Lord Mayor, who surrendered it to the chairman of the meeting, the Duke of Argyll. The presidential address of welcome to the members of the Congress was then delivered by Mr. Belcher. Sir Aston Webb proposed a vote of thanks to the Lord Mayor, who then left the hall. Mr. W. J. Locke, secretary of the Congress, then read his report, giving various data which we have already published. Following this, replies to the address of welcome were delivered by the following representatives of various countries :—

Austria	Otto Wagner
Belgium	J. J. Caluwaers
Denmark	Vilhelm Dahlerup
Holland	J. T. Cuypers
France	H. Daumet
Germany	H. Muthesius
Greece	M. A. Metaxas
Hungary	J. Berczik
Italy	Prof. D'Andrade
Japan	S. Chujo
Portugal	Ventura Terra
Russia	A Representative
Spain	Don Velasquez Bosco
Sweden	Prof. Clason
United States ...	George B. Post

The Duke of Argyll then delivered an inaugural address in which he welcomed the visit of foreign architects to this country in connection with the Congress. On the motion of Mr. Belcher a vote of thanks was accorded to Princess Louise and the Duke of Argyll, and the meeting terminated. By the courtesy of the Lord Mayor and Corporation, the Art Gallery, containing a valuable collection of works by Belgian painters was thrown open to members of the Congress, who were invited to visit it at the conclusion of the ordinary meeting.

On Monday evening a soirée was held at Burlington House, by kind invitation of the president and council of the Royal Academy.

Tuesday.

The serious work of the Congress began yesterday (Tuesday) morning, when meetings were held at the Grafton Galleries and the Institute premises in Conduit Street, W. At the former, interesting papers on steel and reinforced concrete construction were read by Prof. Henry Adams (England), Mr. E. P. Goodrich (America), Prof. Cloquet (Belgium), and Joaquin Bassegoda (Spain)—summaries of which papers will be found in the "Concrete and Steel" supplement included in this issue: while at the Institute premises a paper on "The Château of Saint-Germain" was read by M. Honoré Daumet (described and illustrated in our issue for June 14th, 1905), and papers on "The Execution of Important Government and Municipal Architectural Work by Salaried Officials," read by Herr Otto Wagner (Austria), M. Oscar Simon (Belgium), and M. Gaston Trélat (Paris). In the afternoon visits were made to Hatfield House and to Hampton Court Palace, and in the evening a conversazione was held at the Mansion House by kind invitation of the Lord Mayor.

Wednesday.

To-day (Wednesday) papers on "The Architect-Craftsman" are to be read Mr. Reginald Blomfield, Mr. W. R. Lethaby, and others at the meeting in the Grafton Galleries, while at the Institute premises "The Organisation of Public International Architectural Competitions" and "Architectural Copyright and the Ownership of Drawings" will be dealt with. There will be visits this afternoon to Buckingham Palace Gardens, Westminster Abbey, Messrs. Holloway's Works at Westminster Bridge and Messrs. Doulton's Potteries at Lambeth, and in the evening the Congress will reassemble at the Grafton Galleries and at the Institute premises, "The Planning and Laying-out of Streets and Open Spaces" being dealt with at the former, and "The Responsibilities of a Government in the Conservation of National Monuments" at the latter.

Thursday.

To-morrow (Thursday), at the Grafton Galleries, papers will be read on "The Education of the Public in Architecture," while at the Institute premises the subject of "Architectural Copyright and the Ownership of Drawings" will be further considered, and papers read on the question of the architect's control over other artists or craftsmen in the completion of a national or public building. The visits to-morrow afternoon will be to Windsor Castle, St. Paul's Cathedral, The Temple, St. Bartholomew's, The Institute of Chartered Accountants, Kensington Palace and Dorchester House, and in the evening there will be a garden party at the Royal Botanic Society's Gardens in Regent's Park.

Friday.

Friday will be given up to all-day visits to Oxford and Cambridge, and, as alternatives, to the Tower of London and Tower Bridge, and the Victoria and Albert Museum, and Royal College of Science at South Kensington, The Congress will meet, however, at the Grafton Galleries in the evening, when Mr. Cecil Smith will read a paper on "The Tomb of Agamemnon," and there will also be a gathering at the Art Workers' Guild in Clifford's Inn Hall.

Saturday.

On Saturday morning there will be a meeting of the International Permanent Committee at 9, Conduit Street, and a meeting of the Congress at the Grafton Galleries to consider the subject of "A Statutory Qualification for Architects." A morning visit to Bridgewater House is arranged, and visits in the afternoon to Greenwich Hospital, the Houses of Parliament and Westminster Cathedral. In the evening there will be a farewell banquet at the Hotel Cecil, bringing to a close the first International Congress of Architects which has ever been held in this country.

The Exhibition

in connection with the Congress is divided into eight sections. Four of them deal respectively with Early Medieval, Late Medieval, Early Renaissance, and Later Renaissance work, affording a fair chronological exhibition of British architecture. Then there is a collection of photographs of work by living architects; a water-colour section devoted to drawings of British buildings (among them being two drawings by Turner, and a number of others by well-known draughtsmen); a furniture section (in charge of Mr. E. Guy Dawber), comprising some very beautiful picked specimens of British furniture from the year 1535 downwards; and a silver collection—only a small one, in three cases, but valued at many thousands of pounds.

The following are some

Notes on Buildings Visited.

The Guildhall.—The old roof of the Great Hall was destroyed in the Fire of London (1666). A temporary flat roof was erected in its place and remained in position for nearly 200 years, when the present roof was erected from the designs of the City architect, Sir Horace Jones, in 1864. The fire did much damage to the inside walls of the Great Hall and they were covered many years ago with a preparation of silica; this coating it is now proposed to remove.

Burlington House.—The old house—the centre block in the rear of the Quadrangle, was built in 1665 for the first Earl of Burlington, Colin Campbell, being the architect. The room on the first floor remains as it was decorated by Lord Burlington in 1720 and is a very interesting example of the period.

Hatfield House.—The present mansion was built between 1607 and 1611. The facade is supposed to have been designed by John Thorpe. At one time the mansion was allowed to fall into a state of disrepair, and in 1835 the west wing was demolished by fire; in the rebuilding, however, the original plan was mainly adhered to. The plaster ceiling of the gallery (163ft. by 20ft.) and the chimney-piece of the Great Chamber are notable features, as also the Flemish stained-glass work in the chapel.

Hampton Court Palace.—Built originally by Cardinal Wolsey, who presented it to Henry VIII. in 1526, it was partly pulled down by William III., who erected the celebrated Fountain Court, the Colonnade and the State Apartments—Wren being the architect. Verrio executed many paintings inside the building, and Grinling Gibbons carved the east facade. A fine example of an open hammer-beam roof is to be seen in the Great Hall (106ft. by 40ft. by 60ft. high).

Buckingham Palace. — Built 1752-1835 from designs by John Nash, and afterwards altered by Edward Blore, who was responsible for the present front. The grounds comprise 43 acres.

Westminster Abbey.—As the result of a thorough examination of Westminster Abbey by the architects to the Dean and Chapter and of the Ecclesiastical Commissioners, it has been decided during the next four or five years to execute extensive repairs, at a total cost of £20,000. The scheme includes the practical refacing of the whole north front, the surface stones being largely replaced by new ones.

Windsor Castle.—In St. George's Chapel is to be seen one of the finest examples of fan vaulting in the kingdom. Prof. Willis examined its construction in 1840, during the repair of the external roof, and made careful drawings of it, preserved in the R.I.B.A. "Transactions" for 1842.

St. Paul's Cathedral.—Begun and completed under Wren (1632-1723) at a cost of £747,661. The outer dome, 145ft. in diameter, is of wood covered with lead and does not support the lantern, which rests on a cone of brickwork raised between the inner cupola and the outer dome.

The Temple.—The Middle Temple Hall was built in 1572, and is an admirable example of Elizabethan work. The Temple Church consists of two parts—the round church (Transition Norman work) and the choir, finished in 1240; alterations and restorations were carried out in 1839-42 at a cost of £70,000. The Middle Temple Library, opened in 1861, was designed by H. R. Abraham, and the Inner Temple Hall, 1868-70, by Sidney Smirke.

St. Bartholomew's.—The finest example of Norman work left in London. In recent years considerable restoration has been carried out under the direction of Sir Aston Webb.

Institute of Chartered Accountants. — Built 1890-1893 from designs by Mr. Belcher, and one of his most successful works. Notable, too, as showing the employment of sculpture with architecture, there being a friese 140ft. long by Mr. Thornycroft, and corbel groups, &c., by the late Harry Bates, A.R.A.

Kensington Palace. — Sold for 180,000 guineas to William III., and by him partly rebuilt according to the designs of Wren and Hawksmoor. The Orangery is generally ascribed to Wren.

Dorchester House.—Erected in 1852-1854 from designs by Vulliamy. There is a very elaborate marble staircase in the interior, many gorgeous rooms, and a mantelpiece by Alfred Stevens.

Tower of London.—The oldest part is the White Tower, built by William the Conqueror and restored by Wren, who modernised the exterior, though the interior remains intact. The chapel is a fine example of Norman work. The tower is now undergoing its triennial cleaning and painting. The doors of some of the old towers show a new coat of green. The ancient woodwork of the Traitor's Gate and Bloody Tower is to be cleaned and perhaps varnished, and the buildings occupied by the Lieutenant of the Tower painted stone colour.

Oxford.—Of all the colleges there is not one to compare with Magdalen for pure charm. All its buildings date from about 1480, the tower about 1500, the large block in the deer park about 1735, and the front to High Street by Mr. Bodley. Of modern work, there is Exeter College Chapel (by Scott, 1856), Balliol College Chapel (1856), and Keble College (1870), by Butterfield, while Mr. T. G. Jackson, Mr. Henry T. Hare, Mr. E. P. Warren, Mr. Basil Champneys, and Mr. Reginald Blomfield have done considerable work there. Burne-Jones did some windows at Manchester College and a fine tapestry at Exeter College.

Cambridge.—Clare is one of the most finished pieces of architecture in the University, and King's College Chapel the most impressive interior. Of modern work, a great deal has been done by the late Mr. Alfred Waterhouse, Sir Gilbert Scott, Mr. G. Gilbert Scott, jun. (whose new court at Pembroke is very fine), Sir Aston Webb (Gonville and Caius), Mr. Bodley (Queen's), and the late Mr. Pearson (Emmanuel and Sidney Sussex). The large Roman Catholic Church of Our Lady and the English Martyrs (1890) is by Messrs. Dunn and Hansom.

South Kensington Museums.—The large extension to the Victoria and Albert Museum now in course of erection is by Sir Aston Webb. The Museum of Natural History is one of the late Mr. Waterhouse's best works, notable as an early example of the use of terra-cotta on a large scale. The design was the outcome of a competition held in 1864, which was won by Captain Fowke, of the Royal Engineers—the designer of the Albert Hall. Captain Fowke, however, did not live to undertake the work, which was given to Waterhouse. The contract for the building, exclusive of the towers, was £352,000.

Greenwich Hospital.—One of the most interesting buildings in London by reason of its position and monumental treatment. As successor to Inigo Jones, Wren was the architect for most of the work; but Hawksmoor, Campbell, and Vanbrugh had a share in it. The ceiling in the Painted Hall is by Thornhill (1717).

Houses of Parliament.—A competition was held for the design, and Sir Charles Barry's scheme was accepted. It was a condition that the "Gothic or Elizabethan" styles should be employed. It was originally intended to remove St. Margaret's Church and to enclose the whole of New Palace Yard with buildings. The magnificent Victoria Tower is 70ft. square and 400ft. high to the crown on the flagstaff, the Clock Tower being 316ft. high. The roofs are of wrought-iron covered with cast-iron galvanised plates. Altogether the Houses of Parliament cost £2,000,000, one quarter of that sum having been spent on the sculpture, decoration, and elaborate fittings.

Westminster Cathedral.—Bentley's great work; the most important Roman Catholic church built in this country since the Reformation. The scheme is that of one huge nave 60ft. wide, 117ft. high, and covered with saucer domes of concrete. It is practically only a great shell of brickwork at present, the interior decoration being but little advanced. Some splendid marble and mosaic work is, however, to be seen there.

Bridgewater House.—Built in 1847-50 from Sir Charles Barry's designs.

Obituary.

Mr. W. J. Gant, F.R.I.B.A., of Hastings, died recently, aged 82.

Mr. John Dixon, master-builder, of Kendal aged 59, committed suicide by hanging himself last week.

The late Mr. Edward Solomons, F.R.I.B.A. of Manchester, who died in May last, left estate which has been proved at £4,243 gross.

Mr. Bradley Batsford, for many years senior partner in the well-known firm of architectural publishers on High Holborn, died recently, aged 60. It is only quite recently that his father died, the founder of the firm. Mr. Bradley Batsford was a man of keen perception, artistic taste, and sound judgment, and his loss is felt greatly. The business is being carried on by his brother and his nephew.

OFFICIAL ARCHITECTURE.*

By Otto Wagner.

Imperial and Royal Superintendent of Works; Profess
of the Imperial and Royal Academy of Plastic Arts.

[*On behalf of the Society of Austrian Architects*]

It will be convenient to give first a clear definition of the word "architect" and also some explanation of the process of development of the architect, because all the differences of opinion are more or less rooted in the wrongful acceptation of these conceptions.

With regard to the way in which the architect is developed, it must be taken into consideration that artistic capacities, such as manual proficiency, imagination, taste, individuality, and a certain gift for invention, are faculties which the architect must possess in his quality as an artist, but which cannot be learnt. On the other hand, there are a general culture and a technical and constructive knowledge which the architect must also possess, but which can be acquired by study.

The amount of scientific knowledge to be acquired by the architect has reached such vast proportions that it has to be divided into parts, consequently into branches of knowledge. For this reason alone it is not possible for the young man who wants to become an architect to acquire full knowledge of all these special branches, since the time at his disposal, and the intellectual receptivity of the individual, are limited.

The architect, during the whole of his professional activity, will cultivate first of all the region of art, which nowadays even in literature has become of a very wide range. But as at the same time he is expected to have full knowledge of all technical innovations, his technical and scientific education should extend so far that he will be able to understand the essence of the sciences and their progress, and that this understanding will enable him in his practical work to put the results of human progress at the service of art.

His technical education must, moreover, enable him to choose the proper methods of construction and the most convenient materials to be employed. Nay more, his knowledge, aided by his inborn inventiveness, must enable him to combine new forms of construction, or to vary existing ones, so that they shall answer fully the purposes for which they are required. From this it follows that the practical work and experience which the architect gains in the course of his career must be based upon a sufficiently wide knowledge.

There is, therefore, a sharply marked limit in the course of education of the architect. This limit, as already said, lies naturally between the acquired complete technical education and the entering into an academy of plastic art.

It is the duty of the academy, or rather of the professors of teaching in such an institution, to examine and to decide whether or not the student possesses the inborn faculties enumerated above.

It cannot be too strongly recommended to such professors to use the utmost severity in this examination, because the result of it will have a great influence upon the general artistic standard of the profession, and because it is only by this method that class of pseudo-architects who in our days intrude on the profession, to the discredit of art as well as artists, can be made to disappear from the scene.

---

* Summary of a paper read at the Seventh International Congress of Architects.

We wish particularly to point out that for architects there can be only one school —viz. an academy of the plastic art; an academy for this reason, that art cannot be taught, and consequently cannot be admitted as a scientific subject in any course of studies, and because artistic education only consists in this, that the master shows to the art pupil the right way to perfection, and encourages him by his own activity to enter on this path.

It is, therefore, absolutely wrong for technical high schools and schools for artistic trades to admit in their plan of studies the tuition of architecture, because, owing to the students not being tested as to their aptitude for the profession, an absolutely inferior standard of architecture is created.

From what has been said so far it follows that the architect is an artist with a scientific education.

By the studies of technical matters successfully gone through by the pupil, and with the academical apprenticeship, the requirements of the architect are not yet, however, exhausted. The student is still lacking practical activity, and the experience which results from it.

If the apprenticeship of the architect is an exceedingly long one, it will certainly be very considerably extended by the period he is acquiring practical knowledge in an architect's office.

In this section of the apprenticeship of an architect (his apprenticeship really ends only with his death) he stands once more at the parting of the ways in the progress of his education: that is to say, in which way do his capacities lie? Circumstances, &c., lead him to the point either to accept the struggle for existence, or to enter into the safe haven of a salaried position. Here his artistic capacity plays the main part, because the greater it is the more easily will he be able to refuse the enticing bonds of a fixed position, unless it be a professorship.

The curriculum of education of the architect so far sketched is the normal one, but we would remark at once at this stage that it is certainly not the only one, and that there will be sufficiently numerous cases in which the inborn capacities of the architect, in other words his talents, are so great that a lack of scientific education is hardly of any importance.

This fact, as well as that other, that there is no limit of talent either in more or in less—further, the fact, which it is impossible to dispute, that the first architects in the world in a great many cases are not agreed on the question as to what constitutes an architect, give the certain proof that the title of architect cannot be protected by letters patent, and that a judgment of artistic qualities is possible only by the artists themselves, consequently by the grouping of the artists among themselves.

In the latter circumstance we find also the proof that municipal and State administrations are not even in a position to make the proper choice of an artist to fill an office.

Still another important factor comes into consideration for making such a choice. The architect appointed to an office will, while occupying it, certainly not play the leading part. His individuality, his taste, &c., must therefore subordinate themselves to the same qualities in his superior, or even of more than one superior. The works carried out under the supervision of the office would therefore not show the capacities, the taste, and individuality of the creating artist, but certainly the less valuable ones of his superiors, and as such superiors in most cases are laymen in questions of art, and often even in technical matters, it will be hardly necessary to give any more reasons why from such a combination no good can come.

It must also be mentioned that the artistic gifts of an artist oppressed by the yoke of office can never undergo the absolutely necessary development. These considerations prove sufficiently that a municipal or a State administration is never in a position to obtain the services of first-class artists as salaried officials.

But municipal and State administrations have certainly the sacred duty of cultivating the fine arts, which means with regard to architecture that the buildings erected by them should exercise the effect of models. But buildings of such a description can only be expected from great artists, and not from officials of an inferior artistic capacity.

For the same reasons the competence of the officials must only extend to the practical, technical, and economical, but never to the artistic control of buildings in the course of construction. If, finally, it is taken into consideration that, by the awakening which took place in the region of art, a lively controversy raged everywhere, and that even to this day public opinion has hardly returned to calmness, and therefore is not in a position to judge with unbiassed artistic feeling works of art, such a large number of reasons has been put forward that the correct answer to Question I. becomes easy; it can only be this:

Important municipal and Government buildings can only be constructed by eminent artists, and not by salaried officials.

The considerations alleged up to now will facilitate considerably other questions before the Congress.

By Oscar Simon.

(On behalf of the Central Society of Architecture of Belgium.)

The Central Society of Architecture of Belgium is of opinion that no advantage can result from the execution of public buildings by salaried officials (surveyors, &c.).

Neither for the administration, which protects its agent and takes upon itself the civil responsibility;

Nor for the public, which pays and suffers from the imperfect arrangements of the buildings destined for its use, and the æsthetic feelings of which are too frequently hurt and painfully impressed by the permanent sight of buildings generally devoid of artistic character.

While we shall avoid entering upon personalities or trying to prejudice private interests, and having only in view the preponderance of the architectural art, and for our only aim a better future standing of architects as a professional body, considering that these have a domain of art and its interests to defend, we hold that it is an abuse that certain officials (surveyors) should offer to private parties on the look-out for authorisation by administrations services which are prohibited by the regulations and which are a form of unlawful competition highly prejudicial to the independent architects existing only on the income from their professional art.

It is desirable that more energetic action should be taken by architects, with a view to obtain legislative powers:

1. By bringing into harmony with the modern requirements of life the rate of the out-of-date tariffs still enforced upon architects.

(A juridical consecration should be given to this principle: "To a superior talent higher fees should be allowed.")

2. By putting a stop to persons invading the architectural domain who do not exclusively exercise the profession of an architect.

3. By the revision of the laws on building in those passages where the text, *or the interpretation given to it*, imposes on the architect obligations and responsibilities inconsistent with his mission as an artist and out of proportion to the fees which are allowed for them.

(Apply juridically to the architect and to the contractor the common law principle: "To a larger profit must correspond a more extended responsibility.")

4. The Central Society of Architecture of Belgium, in the conviction that even within a modest range the co-operation of the architect will still result in the work being carried out under advantageous conditions as to price, duration, and arrangement, without excluding an artistic character which it is always necessary to strive after, is of opinion that if it be essential that the execution of public buildings should be entrusted to private architects it is ardently to be desired that *all the work, whatever its importance may be*, of construction and arrangement of plan of buildings for the public use should be exclusively given to practitioners of the architectural art.

In this there are considerations of corporative, economic, educational, and artistic interest, towards which the public officials must not remain indifferent.

To our corporation are due the normal consecration of public teaching of art, a professional encouragement, and an official recognition of the rights and prerogatives legitimately given to our profession.

Moved by a feeling of professional solidarity, *the Seventh International Congress of Architects meeting in London in* 1906, wishing to affirm with all its power the claims and just aspirations of the architects with a view to an improvement of the economic conditions of their existence, formulates the resolution:

That in the future the administration of States, departments or provinces, municipalities or communes, as well as the administrations of benevolent institutions which may be founded by the former, shall give instructions for professional architects to be appointed by way of public or limited competitions, or whose special capacities or repute shall be universally recognised, for the projects of works or buildings to be carried out within their jurisdiction;

That an absolute prohibition shall put an end to the interference of agents paid by the public administrations, that they shall obtain through private persons an authorisation which can only be granted by public authorities;

That within the limits of their influence in the legislative assemblies our representatives shall take the initiative to bring about the reform of the laws in force in such cases where the obligations and responsibilities imposed on the architect are incompatible with his mission as an artist and in disproportion to the emoluments attached thereto.

Views and Reviews.

Prof. Adams's Building Construction.

Professor Henry Adams is an authority on the subject of building construction, having devoted a good many years' attention to the subject. He is noted for the clear manner in which he deals with problems which, in the hands of others, become difficult of comprehension by the ordinary student. We are glad that he has now collected together into one volume a good deal of the information that he has published from time to time. The book is, as stated in the preface, supplementary to the other older books on building construction. In this fact its great value lies. The older books are defective in many respects, especially as regards modern practice, but Professor Adams's book not only serves to provide information which they do not give, but is also a guide to their ready and clear interpretation. One great merit of the book is that many of the examples used by Professor Adams to demonstrate points of theory are taken from actual practice, and thus they are related to everyday problems that occur within the experience of most students. The book is a cheap one, and ought to be in the hands of everyone connected with the building trades. There is certainly a want of continuity about the volume from the very fact that it is supplementary to standard works, but this does not detract from the usefulness of the book. The latter part of the work dealing with stresses in structures is excellent, and we only regret it was not extended. The notes and examples of architecture we think ought to have been omitted. They are not intimately related to the rest of the matter on building construction, and they are too disjointed to be of much service. Although Professor Adams has performed his part of the work well, we cannot say that the publishers have done the same. The illustrations are often reproduced too small and not placed in direct conjunction with the text, so that it is irritating to refer to them when reading the text. The plates are distributed throughout the volume without any relation to the text.

"Building Construction," by Prof. Henry Adams, M. Inst. C. E., &c. London: Cassell & Co., Ltd., price 7/6 nett.

Joiners' Machinery.

The large part which machinery plays in modern joinery means that this book will appeal to a large section of readers. There are not many books that deal with the elements of joinery manufacture as simply as this, and therefore, the book is very welcome. It is fortunately well and clearly written and printed in good type.

"Joiners' Machines and How to Work Them," by T. R. Groom. London: William Rider & Son, Ltd., price 1/- nett.

Plastering.

This is another addition to the many little hand-books of building crafts which Messrs. Cassell publish, and conforms to their general character. It is only a very elementary book, but so far it is quite serviceable. Plasterers' tools, methods of executing ordinary plastering, the theory of the subject, practical hints, together with estimating and measuring are all dealt with, while a good deal of ordinary memoranda is also collected together.

"Plasterers' Work." Edited by P. N. Hasluck. London: Cassell & Co., Ltd., price 6d. nett.

Illustrations of Architecture.

The various plates from Fletcher's History of Architecture have been re-published by Mr. B. T. Batsford separately to serve as class illustrations for the study of architectural history. These will undoubtedly be useful for distribution amongst students attending classes or special courses of lectures. They have been divided up into four sections, namely: Classic and Early Christian, Medieval, Renaissance and Modern, and Non-Historical. The last term we objected to at the time of the publication of the book. It is quite inaccurate to call Indian, Chinese, Japanese and Saracenic work non-historical. The author, it is true, does not deal with the matter historically, as it should be dealt with, and appears to be generally at sea in this branch of art. The fourth section, indeed, is least useful of all. We may mention that the diagrams have also been reproduced to a larger scale, so as to serve as lecture diagrams, measuring 40 inches by 27 inches, *i.e.*, printed on double elephant drawing paper, suitable for affixing to the wall. There are 168 of these sheets in all and a complete set costs £60 nett. The lecture diagrams are also sold in a series of not fewer than 10 at 8/- nett- each.

"Class Illustrations for the Study of Architectural History," from "A History of Architecture on the Comparative Method," by Professor Banister Fletcher, F.R.I.B.A. and Banister F. Fletcher, F.R.I.B.A. London: B. T. Batsford, price, 13s. 6d. nett.

Modern Buildings.

We have already reviewed the first volume of this work in our issue for March 7th last. The second is divided into three parts:—(1) town houses, shops and offices; (2) specification writing and quantity surveying; and (3) the constructional finishing of a building. In the first part a number of valuable plans of somewhat noted buildings that have been recently erected in London are included. There are also coloured plates, showing the manner in which working drawings are customarily prepared. The second part contains a specification for a draper's shop that is interesting, but of course if this is all that is to be provided in the way of specification writing it is altogether insufficient. Several chapters have been contributed by Mr. W. H. Brown, F.S.I., on "Quantities" that are distinctly valuable, summarising such an important subject into a short space. The third part contains chapters on joinery, woods, tools and methods of working skirtings, dados and panellings, doors and framings, window framings, cupboards and bath and w.c. enclosures, stairs and stair building (all by Mr. H. Kennard); external plumbing, drainage, sanitary fittings and their plumbing, and glazing (all by Mr. T. H. Bishop, A.R.I.B.A.); an anonymous chapter on floor paving and wall linings; and, finally, chapters on bells and bell-hanging and plastering, by Mr. H. Y. Margary. There is much useful information in this book, and we look forward to the succeeding volumes in anticipation that the complete work will be a most valuable one.

"Modern Buildings: Their Planning, Construction and Equipment," Vol. 2 edited by G. A. T. Middleton, A.R.I.B.A. London: The Caxton Publishing Co., price 10s. 6d. nett per volume.

Terra-Cotta and Reinforced Concrete Floors.—The National Fireproof Co. have secured the contract for the terra-cotta and concrete floors at the Manchester Infirmary, of which Mr. Edwin T. Hall is the architect.

Notes on Competitions

Holborn Municipal Offices.

We publish in this issue the selected design for the new municipal offices to be erected for the Borough of Holborn. It will be recollected that a competition amongst seven selected architects in the locality was instituted a short time ago. From these designs the committee in charge of the matter selected design No. 1, placing design No. 5 second, and design No. 6 third. At last Wednesday's meeting of the Borough Council the envelopes were opened, and the authors of design No. 1 were announced to be Messrs. Warwick & Hall, of South Square, Gray's Inn, W.C. The site for the new buildings adjoins the existing library on High Holborn, and it will be seen that Messrs. Warwick & Hall have taken this into account by making their new design an addition to the library building, repeating it as a wing, with a new centre portion between. The plans sufficiently show the internal arrangements. The other competitors all produced a fresh design, and though we may not perhaps consider the architecture of the library to be particularly worthy of emulation, still, in the circumstances, we think Messrs. Warwick & Hall have done wisely to incorporate it with their scheme, as it enables a more coherent building to be produced, and, at the same time, interferes in the least possible way with the existing arrangements. The estimated cost of the new building is £19,205.

New Central Library, St. Pancras.

The award of the assessor (Mr. Belcher) will be announced at the meeting of the St. Pancras Borough Council to be held on Tuesday, July 31st, when the envelopes will be opened.

Llanidloes Public Hall.

In open competition, the design of Messrs. Shayler & Rigg, architects, of Oswestry and Shrewsbury, has been selected for this building, which is to comprise a market hall, temperance hotel, reading-room and library, and rooms for town council meetings, &c.

Wesleyan Church, Ossett.

The designs of Messrs. Garside and Pennington, architects, of Pontefract and Castleford, have been selected in the competition for a new Wesleyan church and classrooms at South Parade, Ossett.

Competitions Open.

The following is a list of competitions open:—

DATE OF DELIVERY		COMPETITION.
July	24	EXTENSIONS TO SALFORD ROYAL HOSPITAL. Limited to architects in Manchester and Salford. Premiums £100. Names by this date to G. Ruddle, secretary and superintendent of the hospital.
July	28	BATHS AT PRIMROSE MEADOWS, SHEFFIELD. Limited to Sheffield architects. Premiums of £30, £20, and £10. Particulars from Town Clerk.
Sept.	28	SEWAGE DISPOSAL SCHEME FOR ELLESMERE. Premium of £20. Particulars from R. E. Lloyd, Clerk to Urban District Council, Ellesmere.
Sept.	29	REBUILDING OF HENSHAW'S BLIND ASYLUM AT MANCHESTER. Limited to Manchester architects. Premiums £100, £50, and £25. Assessor, Mr. John Holden, F.R.I.B.A.
Oct.	1	ALPHABET COMPETITION. Prizes of £20, £10 and £5. For particulars see "Architectural Review."

Notes and News

L.C.C. Central School of Arts and Crafts.—The tenth annual exhibition of students' work was on view at 316, Regent Street, W., on Thursday, Friday, and Saturday last. More than 900 students have been enrolled during the session, being a great advance upon previous records. The new school building in Kingsway is now under construction.

University College School, Hampstead.—The foundation-stone of the new buildings of University College School at Frognal, Hampstead, will be laid on Wednesday next by the Mayor of Hampstead, Sir George Barham. The architect of the school is Mr. Arnold Mitchell, F.R.I.B.A., whose design was selected in competition last year.

Ipswich Building Trade Dispute Settled.—Six months ago the Ipswich Master Builders' Association gave notice of a reduction of a penny per hour. The men's reply to this was a request for an increase of a penny per hour. No further action, however, was taken on either side, and the matter has now been settled by the builders agreeing to withdraw the notice for reduction and maintaining the present rate of wages.

A Large Stained-Glass Window.—Referring to the paragraph about a large stained-glass window in the North which appeared in our columns recently, Messrs. Joseph Chater & Sons, of 2 St. Dunstan's Hill, London, E.C., write stating that they executed for the Church of St. Lawrence Jewry, in Guildhall Yard, a window 14ft. by 7ft.—all in one light—with 98ft. super. in it. "This, we think, should be a record for the South."

Fifth Avenue, New York, is proposed to be widened. It is the contention of the city authorities that many of the buildings, particularly some of the new, elaborate business structures, extend beyond the legal building line and must be taken down. If this contention is successfully maintained in the courts, it will mean the expenditure of thousands of dollars by property owners and a gain of a wide thoroughfare to the city.

Elementary Schools at Exeter.—Tenders are to be invited for building new elementary schools for girls and infants in the parish of St. James, Exeter. The question of what is a fair charge per head in relation to the accommodation provided was debated at the last meeting of the council. The architect put the cost at £11 per head for the buildings, exclusive of equipment. Several members, however, considered this an excessive sum. To build for 540 children on the architect's estimate will cost rather more than £6,000.

Wallpaper Manufacturers: Halifax Works to be Closed.—The directors of Wallpaper Manufacturers, Ltd., have decided to close forthwith the works at Halifax just acquired from Page, Arnold, & Co. These works, which, with the exception of a small concern at Louth, comprised the only factory outside the wallpaper combine, were only taken over by Page, Arnold, & Co. two years ago after having been standing idle for several years. Entirely new machinery was installed, and improvements carried out, at a cost of over £40,000, while workmen were imported from Glasgow, London, Darlington, and elsewhere.

The New Court House and Technical School at Cheshunt was opened recently. It has been erected by Mr. Paul from designs by the county surveyor.

A New Liberal Club has been erected at Honley, Huddersfield, at a cost of £1,700. The architect was Mr. Joseph Berry, of 3, Market Place, Huddersfield.

The W. H. Smith Memorial Hall and Club has just been completed off Kingsway at a cost (including site) of £12,000. Mr. Allen Vigers was the hon. architect.

The Vauxhall Bridge Pylons.—£440 is proposed to be spent on erecting full-size models of the pylons at the west approach, to the new bridge across the Thames at Vauxhall.

New Baths for Blackburn, in Belper Street were opened last week. They have cost £9,000, and were designed and carried out under the direction of the borough engineer, Mr. W. Stubbs.

West Islington Branch Library.—This library is now being erected. The site is in Thornhill Square. Messrs. Dearing & Son, of Islington, are the builders, and Prof. Beresford Pite, F.R.I.B.A., is the architect.

All Saints' Church, Tooting Graveney, was dedicated recently. It is 180ft. long and has an imposing square tower nearly 100ft. high. The cost of the building has been £50,000. Mr. Temple Moore was the architect.

Messrs. Patman & Fotheringham Ltd., of 100 and 102, Theobald's Road, W.C., have been appointed builders for the rebuilding of the Avenue Theatre for Mr. Cyril Maude, after the Charing Cross roof accident last December.

New Schools at Byfield are in course of erection from designs by Messrs. Law and Harris, F.R.I.B.A., of Northampton. The contractor is Mr. T. Higgs, of Northampton. The total cost, exclusive of site, will be £2,280.

A New Chapel has been erected at Lower Bullingham, near Hereford, for the use of the Community of the Sisters of St. Vincent de Paul. It has cost £5,000, Mr. Ware, of Exeter, being the architect, and Messrs. William Bowers & Co., of Hereford, the builders.

New Y.M.C.A. Buildings at Ealing are being erected at a cost of £6,000 from designs by Mr. W. A. Pite, F.R.I.B.A. The building will consist of four floors, comprising reception hall, assembly hall, reading-rooms, games' room, library, classrooms, and gymnasium.

A New Roman Catholic Church at Tyne Dock has just been completed. It provides accommodation for 500 adults. The church has been designed by Messrs. Brodrick, Lowther & Walker, architects, of Hull. The contractor for the work was Mr. James Young of Tyne Dock.

The New Undercliff Promenade at Ramsgate, the construction of which has been carried out at a cost of £4,600, was opened on Wednesday last by the mayor. The work was undertaken during the winter, and formed part of a scheme for giving assistance to the unemployed.

"Bruce House," the "poor man's hotel," which the London County Council have built at a cost of £46,000 in Kemble Street, Drury Lane, was opened on Friday last. It contains 699 cubicles (let at 7d. per night), and dining-room accommodation is provided for 400 men, with cooking ranges &c., for the men's use, as in Rowton houses

The Historic Farm of Mount St. Jean at Waterloo, is not to be pulled down.

The Theatre Royal, Runcorn, was destroyed by fire last week. It was built mostly of wood.

Brixton's New Fire Station, at the corner of the Gresham Road and Station Road, was opened for duty on Thursday last.

The Edinburgh Architectural Association held its annual excursion recently, when the members visited Tulliallan & Culross.

Sea Defence Works at Lowestoft, comprising a wall and groynes, have been carried out by the corporation at a cost of £68,000.

Law Cases.

An Architect's Registered Design.—In the Court of Appeal last week the case of *Staple v. Warwick* was heard. This was an appeal by the defendant from an order made by Mr. Justice Phillimore in chambers committing him to Holloway for contempt of an order granting an interim injunction pending the hearing of the action. Council said defendant was an engineer, who had commenced to erect an iron tower at Cleethorpes, Lincs., which the plaintiff, a well-known architect, alleged was an infringement of a design which he had registered. The plaintiff conceived the idea of an iron tower which could be ascended by means of an encircling road and staircase. He registered a design under the name of "The Helter-skelter Lighthouse." Several of these lighthouses had been erected from his design, one at the Earl's Court Exhibition, another at Blackpool, and so on, and they had been well patronised. The defendant began erecting one at Cleethorpes which he believed was not an infringement of the plaintiff's registered design. The plaintiff, however, commenced an action, and moved for an interim injunction before Mr. Justice Bucknill, and the learned judge made the order as asked. The defendant therepon altered his design and went on building. The plantiff then applied to Mr. Justice Phillimore to order the committal to Holloway of the defendant, alleging that the building he was putting up was a breach of the order made by Mr. Justice Bucknill. Mr. Justice Phillimore took that view, and the defendant now appealed against the attachment order which had been granted. The Master of the Rolls said that the defendant's case was that he had only copied that part of the plaintiff's design which admittedly was not protected, because it was not novel, and had not infringed those parts of it which could be validly registered. The plaintiff's design was in the form of a lighthouse, and when the action was commenced the defendant at once changed his design from a lighthouse to a machicolated building with overhanging battlements. With the question of infringement still undecided he was not going to allow this gentlemen to go to prison for an act which it might turn out after the trial was not a breach of the injunction, and therefore not an act of contempt at all. With due deference to the learned judge, he thought the committal order should not have been made. The appeal would accordingly be allowed, and the order set aside. Lord Justice Cozens-Hardy concurred.

REINFORCED CONCRETE CHIMNEY CONSTRUCTION.

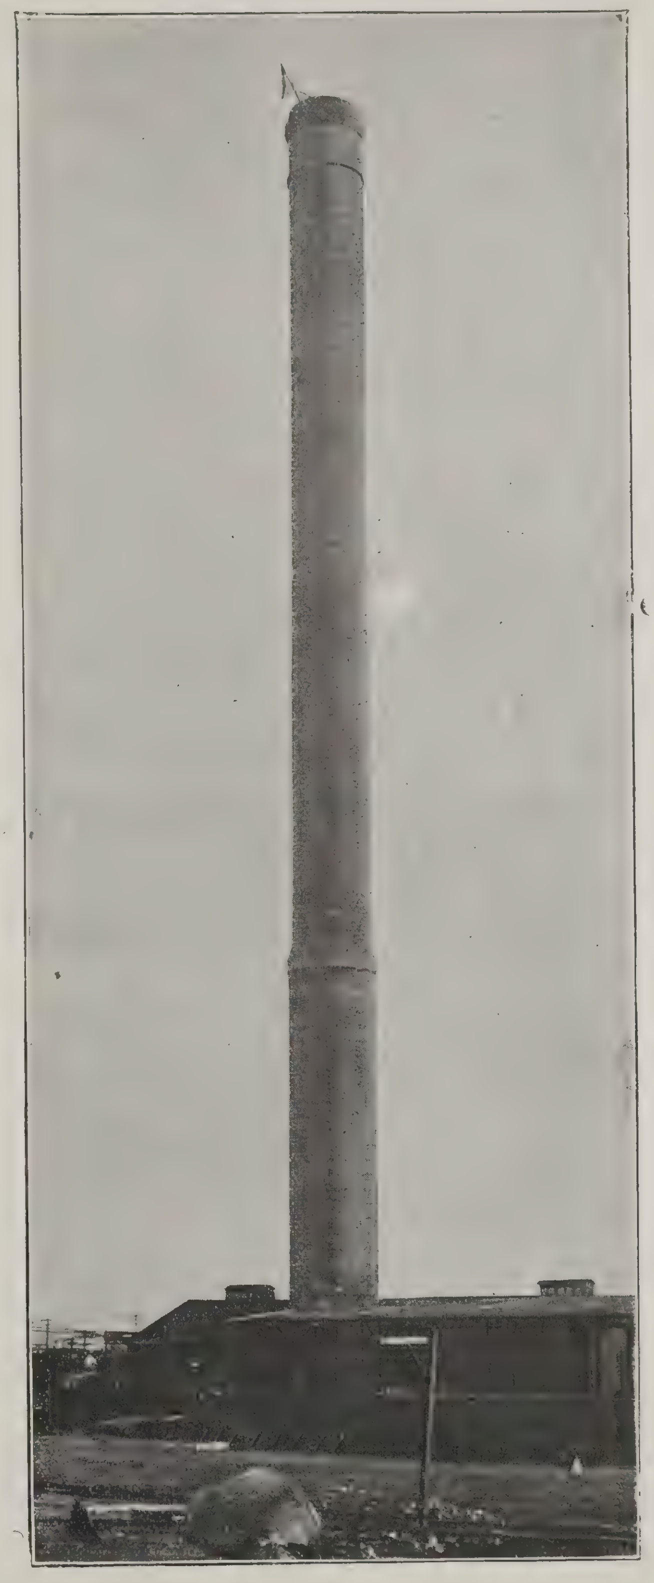
Designed upon Correct Principles.
Monolithic in Character.
Absolutely Air Tight: Economical.

Plans, Strain Sheets, Specifications and Tenders gladly furnished upon request.

Method of Construction fully Covered by Patents in the United Kingdom, &c.

HIGHEST AND LARGEST REINFORCED CONCRETE CHIMNEY IN THE WORLD, COLUSA PARROTT MINING & SMELTING COMPANY, BUTTE, MONTANA, U.S.A.

Two large Reinforced Concrete Chimneys on this system are being erected within twenty miles of Charing Cross



HEIGHT 352 ft. ABOVE GROUND.

DIAMETER 18 ft.

Electrical Notes.

An Illuminating Engineering Society.

We drew attention in these columns recently to the necessity of lighting matters being placed in the hands of trained men. In this connection Mr. L. Gaster, of 32, Victoria Street, S.W., writes to us suggesting the formation of an Illuminating Engineering Society. Such a society, he says, would contribute largely to advance and disseminate the knowledge relating to the science and art of illumination. "The merits and faults of the different illuminants now used, for public or other lighting purposes, would have a better chance to be discussed on a more scientific basis, and the sphere of useful application be more easily defined for each of them. There is no doubt that great economies can be derived from the judicious selection of the system of lighting adopted and the type of lamps, shades, reflectors, &c., used for different purposes. The annual expenditure for lighting purposes in the United Kingdom has been estimated lately to exceed £35,000,000, and it can easily be seen that only a small increase in the efficiency of the systems used will amount to considerable savings per annum.

"The formation of an Illuminating Engineering Society ought to receive a hearty support from the council of the gas and electric institutions, and of the newly-formed British Science Guild. The growing recognition of illuminating engineering as an art is indicated by the recent establishment at the American General Electric Co.'s works of a special department of illuminating engineering in charge of an expert. In the paper read by me before the Society of Arts recently, on the Progress in Electric Lighting, I suggested that there is a wide field open for the illuminating engineer, and I shall be glad to receive the names of any engineers willing to join me in the formation of an Illuminating Engineering Society in this country."

Technical Thermometry.

We have received from the Cambridge Scientific Instrument Company, Ltd., of Carlyle Road, Cambridge, a copy of a new catalogue on technical thermometry recently published by them. The first part of the list is devoted to showing the many applications of electrical thermometers; the electric resistance thermometers, thermo-electric thermometers and the Fery radiation pyrometer being described and explained in full detail. The list is divided into three sections—(1) dealing with the more particular commercial applications of pyrometers; (2) dealing with scientific or research work; (3) an appendix explaining the theoretical considerations of the instruments and giving tables of general interest. An interesting application of the electrical thermometers is that of measuring the temperature in cold stores. In the past the tedious method of sending a man round to read a mercury thermometer fixed in every chamber was adopted, but now it is possible by means of electrical thermometers for the engineer to read the temperatures throughout a large building from the engine-room. In the case of one large cold stores, the time saved in reading the thermometers by this method amounts to six hours a day.

Bankruptcies.

Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—adjudication.

During the week ending July 13th, twenty-three failures in the building and timber trades in England and Wales were gazetted.

S. Booth (late Peerless Patents Co.) builders' merchant, Stockton Heath. R.O., July 5th.

J. Fell, engineer and contractor, Notting Hill, W. First meeting, London Bankruptcy Court, July 20th, at 11. P.E., same, Aug. 9th, at 11.30. R.O., July 6th.

F. Mullins, plumber and decorator, Twickenham. R.O., July 4th.

Lightburn Bros., builders and contractors, Long Benton. P.E., Newcastle-on-Tyne C.C., July 26th, at 11. R.O., July 2nd.

J. Ridgway, builder and joiner, Lichfield. First meeting, O.R.'s, Wolverhampton, July 18th, at 12. P.E., Walsall C.C., July 25th, at 11.30. Liabilities, £631; deficiency, £333.

S. W. Gibbs, builder, Charlwood. Adj., July 5th.

Dix & Co., engineers, Cardiff. First meeting, O.R,'s, Cardiff, July 18th, at 11. P.E., Townhall, Cardiff, Aug. 7th, at 11.

R. E. Cole, contractor, Tottenham. R.O., June 25th.

W. J. Robinson, engineer, Twickenham. First meeting, 14, Bedford Row, W.C., July 19th, at 3. P.E., Brentford Town Hall, Aug. 17th, at 11.

F. Elliott, builder, Tamworth. Adj., July 2nd.

G. Crouch, builder, Birmingham. First meeting, 191, Corporation Street, Birmingham, July 18th, at 11. P.E., Birmingham C.C., Aug. 15th, at 2.

F. A. Simons, builders' merchant, Gravelly Hill. Adj., July 3rd.

C. Fairbank, builder, Birmingham. Liabilities, £897; deficiency, £66. R.O., July 5th.

J. F. Hinchliffe, builder, Penistone. First meeting, O.R.'s, Barnsley, July 18th, at 10.15. P.E., Barnsley C.C., same day, at 10.45.

M. Jenkins, contractor, Port Talbot. P.E., Neath Town Hall, Aug. 7th, at 11.30.

G. S. Cooper, builder, Echt. Liabilities, £200; assets, £129. Sequestration awarded.

G. Goulder, builder, Nottingham. Liabilities, £641; assets, nil.

J. T. Birtwistle, joiner and builder, Blackburn. Liabilities estimated by debtor at £497; proofs submitted, £1,274; assets estimated by debtor, £1,440, actually produced, £15 12s. Case adjourned for six months.

J. McGuire, late builder, Hull. Gross liabilities, £6,780; £6,405, fully secured; deficiency, £375.

WRITE FOR CATALOGUE.

Enquiries Answered.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

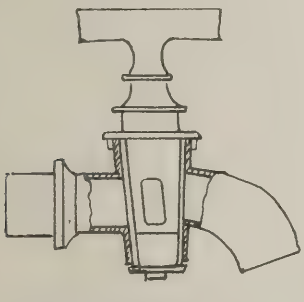
Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Plug Tap: Impounding Reservoirs.

ALDERSHOT. — CORNUBIENSIS writes: "(1) Please give a section of the old type of plug tap which has been superseded by the screw-down in works of water-supply (domestic fittings); (2) What may be considered a fair average cost per million gallons of constructing impounding reservoirs, valve tower, mains to town not included?"

(1) The accompanying sectional sketch shows one form of "plug-tap" as formerly in common use for water-supply draw-off taps, but long since discarded owing to the sudden concussion set up within the service pipes by the abrupt stoppage of the discharge, resulting frequently in great waste of water. The tap consists of a simple plug with a central waterway.



(2) It is not possible to usefully give a definite answer to this question as so much depends upon the circumstances of each individual case—for example, the locality, the facilities and suitability or otherwise of the site, convenience of procuring materials, the nature of the strata underlying the proposed reservoir, &c. Also, the cost will greatly depend upon the total volume of water to be impounded. Small reservoirs cost more per million gallons to construct than large ones. Then, again, some impounding reservoirs are lined with concrete, asphalt and other materials, and the accessary works in one case may be quite incomparable in extent to those in another. The cost of an impounding reservoir of 45 million gallons capacity within our experience, involving considerable excavation, culverting of stream, lining with concrete and asphalt, ranged between £700 and £800 per million, inclusive of all charges for works. Very frequently, however, large impounding reservoirs require no such lining, and comparatively little excavation of the site. Loch Katrine, for example, was converted into an impounding reservoir for the supply of Glasgow, and many other instances of a like character, but on a smaller scale, may be cited in which the physical features of the site selected minimise the artificial works involved. For these reasons, we are of opinion, therefore, that any general figure purporting to be a *fair average cost* would be more misleading to our correspondent than helpful—the possible range of variation being too wide.

Sketching at Wollaton Hall and Kirby Hall.

HALIFAX. — SUBSCRIBER writes: "(1) Are there any facilities for sketching at Wollaton Hall, Notts, and Kirby Hall, Northants? (2) How far is the latter from Northampton? (3) To whom should I apply for permission to sketch and measure at each place? (4) Is it necessary to apply by letter beforehand?"

(1) In the neighbourhood of Wollaton Hall there are many places of architectural interest. At Wollaton village, 2¼ miles west of Nottingham, there is a church containing some interesting monuments. Nottingham contains several fine examples of architecture. Of the castle built by William the Norman but little remains in the shape of a gate-house which has been defaced somewhat by modern insertions. The Perpendicular churches of St. Mary and St. Peter are worth studying, and the modern Roman Catholic church by Pugin is worth a visit. Goralston Church contains some Early English work, and Woodborough Church possesses a splendid Decorated chancel—the best in this part of the country. Interesting churches will also be found at Burton Joyce and Lowdham. A trip to Southwell Minster should be arranged while in this part of the country. Kirby Hall is situated in one of the most out-of-the-way parts of Northamptonshire, and for this reason is rather separated from the other architecture of the county. It was designed by John Thorpe, and the first stone was laid in 1570, as indicated in the original plans in the Soane Museum, Lincoln's Inn Fields, London. The Church of St. James at Gretton (restored) contains Early English work in the chancel and aisles, Decorated work in the transepts, and some Norman work. Picturesque seventeenth-century houses are also to be found at Gretton. The church at Great Weldon is mainly Early English in style. A visit to the stone quarries of Weldon will prove interesting to the architect. At Harringworth there is a church—St. John's—with a fine tower and spire, and a handsome wood screen. (2) Kirby Hall is about 35 miles as the crow flies from Northampton, and the journey from one place to the other will prove rather a tedious one. (3) Wollaton Hall is the residence of the owner, Lord Middleton, and Kirby Hall is a possession of the Earl of Winchelsea and Nottingham, whose address is Harlech, Merioneth. Application for permission to sketch had better be made direct to the owner in each case. (4) You will probably have no difficulty in getting permission to sketch on the spot at Kirby Hall; but Wollaton Hall is not open to the public. You would do well to obtain permission to sketch both cases beforehand.

H. Y. M.

Calverley Wood Grey Stone.

SOUTHPORT writes: "Please give some information about Calverley Wood grey stone—its price, and whether a suitable wearing stone for curbs around pavement lights."

A Yorkshire stone of uniform white colour and very durable. Examples: Colne Town Hall, and the lions in front of Bolton Town Hall. Its rate to London is 10s. 10d. per ton. Prices may be had on application to John C. Rowan, 28, Drewton Street, Bradford.

SIR ASTON WEBB ON SHOP ARCHITECTURE.

Writing in the *Nineteenth Century* on the rebuilding of Regent Street Quadrant, Sir Aston Webb takes up the general question of shop architecture. He says: "Of recent years 'unmitigated' shop fronts have been allowed to run riot through our streets, facilitated perhaps by the relaxed conditions in the latest Building Act. It seems to be considered essential by some to face the whole of the ground and first-floor fronts of a long series of houses with an appalling mixture of plate glass, looking-glass, and tawdry wood and brass work; to commence any architectural treatment on the second floor; and to cover the whole building over in due course with advertising announcements. Now even if, as some contend, the vulgar treatment results in increased sales for a time, there can be little doubt but that it leads in the long run to the deterioration of the character of the street and of the shops as first-class business property. It has been hinted, in the supposed interest of the shopkeepers, that provision should have been made for such shop fronts in the Quadrant itself, where surely if anywhere such a treatment should be an absolutely derogatory impossibility. Walking through our streets it is fairly obvious to the most superficial observer that it is not necessarily the best firms who have the largest window shows, but rather the contrary. Public taste, by common consent, has improved in recent years, and is hardly likely to be long impressed with these vulgar shop-fronts which entirely disregard all surrounding æsthetic and structural conditions, and vulgarise not only the buildings to which they are attached, but also the goods which are displayed in them. . . ."

THE SANITARY ENGINEER.

In his address to the Institute of Sanitary Engineers on the occasion of their annual summer meeting at Manchester on July 6th, Sir William Mather, M.I.C.E., said the Institute represented a branch of the engineering profession which was the most beneficial of all. There were the civil engineer, the hydraulic engineer, the electrical engineer, the mechanical engineer, but the sanitary engineer seemed to differ from every one of these, inasmuch as he laboured in a field in which, more or less, all branches were interested, but which had to do almost solely with the well-being of the people. Moreover, he had to work without many of those incentives and rewards which attached to other branches of the profession. It was a branch of engineering which did not offer many attractions to those who desired to win praise from their fellow-men or to erect monuments to themselves by the work of their hands. England, as they knew, enjoyed the reputation—or did enjoy the reputation some years ago—of being the most advanced nation in the world in sanitary science and in its application. He remembered how, after a visit some twenty years ago, an eminent German scientist, Dr. Virchow, reported that England was one hundred years behind Germany in education, but one hundred years ahead of Germany in sanitation. Sir William said he remembered Berlin when it was a city ugly and offensive in many respects, with no drainage system except that which was exposed to the street, with a vile atmosphere, bad water, and bad lighting. But after twenty years Berlin was now the pride of the German Empire.

Complete List of Contracts Open.

WITH a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

July 19. Cultra.—*Erection of a dwelling-house* near Cultra Railway Station. Plans and specification may be seen and copies of the bill of quantities obtained at the office of Graeme-Watt & Tulloch, architects, 77A, Victoria Street, Belfast, on payment of a deposit of £1 1s., which will be returned to those contractors who submit a bona-fide tender. Sealed and endorsed tenders to be delivered at the above office not later than 10 a.m. on July 19.

July 19. Somerset.—*Erection of a bungalow residence*, on the Crowcombe estate, Somerset, for G. Connock Dyke. Plans and specification may be seen Crowcombe station, on application to John A. Tozer: and further particulars from G. C. Strawbridge, architect, 25, Alma Street, Taunton. Tenders to be delivered to G. C. Strawbridge or or before July 19.

July 19. Goldhanger.—*Alterations and additions* to the Gardener's Farmhouse, Goldhanger, for H. F. J. Coape-Arnold. Applications for plans, &c., to reach T. F. Tickner, architect, High Street Chambers, Coventry, not later than July 19.

July 19. Thornton Dale.—*Additions and repairs* to the Hall and out-buildings, Thornton Dale. Also for the various trades required in the erection of a house in Thornton Dale. Plans and specifications may be seen at the estate office. Tenders to be sent in to A. Hill, The High Hall, Thornton Dale, not later than July 19.

July 19. Devonport.—*Certain works required to complete the erection of a cart shed* at Pottery Quay for the Devonport Council. Plans, specifications and conditions may be seen and form of tender obtained at the Surveyor's Office, Municipal Offices, Ker Street, Devonport. Sealed tender, endorsed "Tender for Cart Shed, Pottery Quay," and addressed to J. F. Burns, borough surveyor, Municipal Offices, Ker Street, must be delivered on or before 10 a.m. on July 19.

July 19. Thornton-le-Beans.—*New school at Thornton-le-Beans* to accommodate about 60 children for the North Riding of Yorkshire County Council Education Committee. Contractors desirous of tendering for the work will be supplied with bills of quantities when ready, upon forwarding their names to Douglas Smith, secretary, County Hall, Northallerton. Such applications to be received not later than July 19.

July 20. Belfast.—*Building and completing a block of warehouses at Franklin Street, Brunswick Street and James Street South.* Quantities may be had on application to S. C. Hunter, building surveyor, 2, Wellington Place, Belfast. Plans, &c., may be inspected on application to H. Seaver, B.E., architect, Scottish Temperance Buildings, Belfast. Sealed tenders, endorsed "Warehouses," to be lodged with H. Seaver, not later than 12 o'clock noon, July 20.

July 20. Stretford.—*Erection of twenty pairs of semi-detached cottages* in Lacy Street, Stretford, for the Urban District Council. Plans, form of tender, &c., may be seen, and bills of quantities obtained, at the offices of John Bowden & Co., architects, 14, Ridgefield, Manchester, upon payment of £1. Tenders to be sent to the Chairman, Sanitary Committee, at the Council Offices, Old Trafford, on or before July 20, endorsed "Tender for Cottages."

July 21. Heath Town.—*Erection of new infants' department at Woden Road Council School, Heath Town.* Builders desiring to Tender for the work should apply to G. Balfour on or before July 21. Quantities will be supplied upon a deposit of £1 1s. being made. The drawings and specification can be seen at the County Education Offices, Stafford.

July 21. Inchlea.—The Directors invite Tenders for the *Mason, Carpenter, Slater, Plaster, Plumber, Painter, in the erection of a block of three houses* for workmen at Inchlea Crossing Loop, between Newtonmore and Dalwhinnie Railway Stations, for the Highland Railway Co. Plans and Specifications may be seen with Mr. William Roberts, Company's engineer-in-chief, at Inverness, or with the Station Agent at Kingussie. Sealed Tenders, addressed to Robert Park, secretary, The Highland Railway Co.'s Office, Inverness, and marked on the outside, "Houses, Inchlea," to be lodged by July 21.

July 21. Maesteg.—*Alterations and additions to Bethel English Baptist Chapel*, Maesteg. Plans and specifications may be seen with the Rev. R. Davies, Rhiaufa, St. Michael's Road, Maesteg. Sealed and endorsed Tenders to be delivered to G. Griffiths, Hon. sec., St. Michael's Road, Maesteg, on or before July 21.

July 21. Guildford.—(a) *The construction of a small store, external shelter and a pent roof* in connection with the new casuals block, and (b) external painting at the Infirmary Buildings, both at the Union Workhouse, Guildford. Specifications and plans of the proposed work can be seen on application to Edward L. Lunn, architect, 36, High Street, Guildford. Sealed tenders, endorsed "Building Work at Casual Block" and "Painting Infirmary," are to be sent to W. S. V. Cullerne, Union Offices, Commercial Road, Guildford, not later than 10 o'clock a.m. on July 21.

July 21. New Hey.—In connection with Sewage Works at New Hey, the Crompton U.D.C. solicit tenders for the following: Contract No. 1.—Erection of Buildings for sludge-pressing machinery and other works in connection therewith. Contract No. 2.—Supply and Installation of Suction Gas Producer Plant, gas engine pump, air compresser and receiver, water tanks, and all shafting, piping, &c. in connection therewith. Contract No. 3.—Supply and Installation of Sludge Press, dams, mixer, cast-iron overhead sludge tank, and all piping, &c. in connection therewith. Plans, specifications, and general conditions may be seen and forms of tender, with all necessary information, obtained on application to J. F. Wilkinson, M.Inst.C.E., Council's engineer, 301-304, Cathedral Street, Manchester, accompanied by a deposit of £1 1s. Sealed tenders, endorsed "New Hey Sewage Works—Contract No. —" (as the case may be), must be addressed to F. F. Gartside, clerk to the Council, Town Hall, Shaw, near Oldham, and be delivered at this office not later than 10 a.m. on July 21.

July 23. Fawley.—*External painting, alterations to offices, erection of new lavatories and cloakrooms, drainage, new offices, heating, ventilation, &c.*, at the school. Builders desirous of tendering may see plans and conditions of Contract, and obtain specification at the Office of W. J. Taylor, county surveyor, The Castle, Winchester, on and after July 9, between the hours of 9 a.m. and 5 p.m., Saturdays, 9 a.m. and 1 p.m. Plans and conditions of contract may also be seen at the school. A deposit of £1 1s. will be required for a copy of the specification. Deposits must be made by cheque payable to Hants County Council and crossed Bank of England, or particulars will not be sent. Tenders endorsed "Proposed Work, Fawley Council School," are to be delivered to H. Barber, clerk to the County Council, The Castle, Winchester, not later than 10 a.m. on July 23.

July 23. Risca.—*For the erection of public offices, stables and cartshed, together with boundary walls.* Plans and specifications may be obtained from A. J. Dardis, surveyor, Council Offices, Risca, on deposit of £2 2s. Separate prices must be shown for each of above works. Fair wages clause. Tenders must be sealed and marked "Tender for Offices," and delivered to T. S. Edwards, clerk to the Council, 24, Stow Hill, Newport, Mon., on or before July 23.

July 23. Porchester.—*Gravelling, erection of offices, ventilation, &c.*, at the Council school. Plans and conditions of contract may be seen and specifications obtained at the office of W. J. Taylor, county surveyor, The Castle, Winchester, on and after July 9, between the hours of 9 a.m. and 5 p.m. (Saturdays 9 a.m. and 1 p.m.). Plans and conditions of contract may also be seen at the school. A deposit of £1 1s. will be required for a copy of the specification. Deposits must be made by cheque payable to Hants County Council and crossed Bank of England, or particulars will not be sent. Tenders endorsed, "Proposed Work, Porchester Council School," are to be delivered to H. Barber, The Castle, Winchester, not later than 10 a.m. July 23.

July 23. Bexley.—*The extension of the existing Car Shed* to form a paint shop. *The erection of a steel structure for a repairing shop* for the Urban District Council. Drawings, specifications and bill of quantities may be seen at the manager's office, car sheds, Bexley Heath. Copies of the bill of quantities will be supplied on payment of 10s. Sealed tenders marked (1) "Paint Shop," (2) "Repairing Shop," as above to be delivered to C. G. Baynes, Oak House, Bexley Heath, Kent, not later than noon, July 23.

July 23. Braishfield.—*Repairs, painting, and provision of lavatory accommodation* at Braishfield school, Conditions of contract may be seen, and specification obtained of W. J. Taylor, county surveyor, The Castle. Winchester, between the hours of 9 a.m. and 5 p.m. (Saturdays 9 a.m. and 1 p.m.) Conditions of contract may also be seen at the school. A deposit of £1 1s. will be required for a copy of the specification. Deposits must be made by cheque payable to Hants County Council and crossed Bank of England. or particulars will not be sent. Tenders endorsed "Proposed Work, Braishfield Council School," are to be delivered to H. Barber, The Castle, Winchester, not later than 10 a.m. on July 23.

July 23. Fowey.—*Taking down old and erecting new building in Fore Street, Fowey.* Drawings and specifications can be seen on application to R. Vincent, Manager Fowey Wine Co., Fowey. Tenders to be delivered to the above on or before Monday, July 23.

July 23. Bagthorpe.—*Building alterations* at Bagthorpe Workhouse. Particulars and quantities may be obtained on application to Arthur Marshall, A.R.I.B.A., architect, King Street, and on payment to him of a sum of £2 2s. Tenders must be delivered to G. M. Howard, Poor Law Offices, Shakespeare Street, Bagthorpe, before 12 noon on July 23.

July 23. Mountain Ash.—*Erection of a mixed school* (to accommodate 400 children), with the necessary offices, boundary walls, &c., at Darranlas, Mountain Ash. Plans and specifications may be seen and forms of tender and bills of quantities obtained on application to W. H. Williams, architect, Town Hall, Mountain Ash, upon the deposit of £2 2s. The bill of quantities is to accompany the tender, but in a separate sealed and endorsed envelope. Sealed tenders and sealed bills of quantities, endorsed "Darranlas Mixed School," to be received by A. Morgan, Town Hall, Mountain Ash, not later than July 23.

July 23. London, W.—*Repairs to the gutters, parapets*, &c., at the Asylum in Cleveland Street, W., the specification for which may be seen by appointment, and bills of quantities obtained at the office of William Lockwood, architect, 12, Sherwood Street, Piccadilly Circus, W., on payment of £2 2s. Tenders, addressed to the Board of Management, will be received at the Clerk's Office, Cleveland Street Asylum, not later than 10 a.m. on July 23.

July 23. Tredegar.—*Erection of two semi-detached villas* for T. J. Price, Esq., Glanyrafon, Tredegar, to whom sealed and endorsed tenders should be sent by July 23. Plans and specification may be seen with W. S. Williams, architect, Tredegar.

July 24. Gorleston.—*Alterations to a building* adjoining the Tramway Depôt, Gorleston, and adapting the same for use as a manual instruction centre. Tenders are also invited for alterations to the offices of Church Road Board School, Gorleston, and Cobholm Island Boys' School. Plans and specifications may be seen at the Office of the Borough Surveyor, Town Hall, Great Yarmouth. Endorsed tenders to be delivered at the office of the education committee by noon on July 24.

July 24. Mutley.—*Erection and completion of a police and fire station at Ford Park, Mutley.* Plans and specification can be seen and forms of tender and bills of quantities obtained on deposit of £2 in cash. Sealed tenders, accompanied by the fully-priced out bill of quantities, to be delivered to J. Paton, borough engineer and surveyor, Borough Engineer's Office, not later than five p.m. on July 24. Conditions upon which forms of tender will be granted may be seen at his office.

July 24. Sherborne.—*Enlargement and alterations* to the General Post Office, Sherborne. Plans and specifications may be seen at the office of the architect, SS. John's Buildings, Sherborne, between the hours of ten and five. Tenders, endorsed, "Tender for Post Office," to be delivered free to Fooks & Douglas, solicitors, Sherborne, not later than ten o'clock, on July 24.

July 24. Mardy, Glamorgan.—*Pulling down and rebuilding the conservative working men's club*, Mardy, Glamorgan, for the trustees. Plans and specifications may be seen at the Club premises, Mardy. Tenders to be delivered to T. R. Leyshon, secretary, 24, North Terrace, Mardy, Glamorgan, on or before 6 p.m., July 24.

July 24. Guisborough.—*Additions and alterations to the King's Head Hotel*, Guisborough, for James Calder & Co., Alloa, Ltd., brewers. Plans, specifications, and conditions may be seen, and bills of quantities obtained of W. Duncan, architect and surveyor, 43, Albert Road, Middlesbrough, until Tuesday, July 24, 1906, on which day tenders are to be delivered to W. Duncan, endorsed "Tender."

July 24. Douglas (Isle of Man).—*Alterations and additions* to the Tynwald Street Schools (Girls' Department). For plans and specifications apply to G. & W. R. Kay, architects, Athol Street, Douglas. Fair wages clause. Full particulars as to the time of the commencement and completion of the work and conditions upon which tenders will be received may be had from the clerk of the School Board or the architects. Sealed tenders, endorsed "Tenders for Alterations to Tynwald Street School," to be delivered at the office of the Board on or before July 24.

July 24. London, S.W.—*Pulling down and reconstructing* the second portion of the Streatham Depôt, Streatham Hill, as a car shed for electric cars. Full information as to the conditions to be observed by Tenderers is given in the London County Council Gazette (price 1*d*., post free 1½*d*.), which can be obtained from P. S. King & Son, 2 & 4, Great Smith Street, Westminster, S.W. Tenders must be upon the official forms to be obtained from the Superintending Architect's Department (Highways Section), 13 Charing Cross, S.W., and no Tender will be received after 10 a.m. on July 24.

July 25. Dartford, Kent.—*Engineering alterations to laundries* at Darenth Asylum, Dartford, Kent, in accordance with drawings and specifications prepared by W. T. Hatch, M.I.C.E., M.I.Mech.E., engineer-in-chief. Drawings, specifications, conditions of contract and forms of tender may be inspected at the office of the Board, Embankment, E.C., and can then be obtained upon payment of a deposit of £2. Tenders, addressed as noted on the form, must be delivered at the office of the Board not later than 10 a.m. on July 25.

July 25. Sutton, Surrey.—*Stabling and other buildings* on the Belmont Asylum Estate, Sutton, Surrey, for the Metropolitan Asylums Board. A copy of the specification, conditions of contract, bills of quantities and form of tender can be obtained at the office of the Board, Victoria Embankment, E.C., on payment of a deposit of £1. The drawings can be seen by intending contractors at the office of T. W. Aldwinckle & Son, architects, 20, Denman Street, London Bridge, S.E., on production of the specification or form of tender. Tenders, endorsed in accordance with the instructions on the form of tender, must be delivered at the office of the Board by 10 a.m. on July 25.

July 25. Erdington.—*Erection of boundary walls* at the depôt in Spring Lane of the Erdington Urban District Council. Drawings may be seen, and copies of specification, quantities and form of tender obtained, upon application to H. H. Humphries, engineer and surveyor, the Council House, Erdington, where tenders, endorsed "Tender for Walls," must be delivered not later than twelve o'clock, July 25. Fair wages clause.

July 25. Ashford.—*Erection of a Kentish rag stone boundary wall*, about 1,200 feet long, at its cemetery, Canterbury Road, in accordance with plans and specification, which may be seen. Form of tender, and any other information, obtained on application to

W. Terrill, surveyor, Ashford, Kent, at his office, North Street. Sealed tenders, endorsed "Cemetery Walling," to be sent to F. Hughes Hallett, solicitor, clerk to the cemetery committee, 11, Bank Street, not later than five p.m., July 25.

July 26. York.—*Extending the destructor buildings*, Foss Islands Depôt. Specification and bill of quantities may be obtained of A. Creer, architect, Guildhall, York, on deposit of £1 1s. Tenders, endorsed "Destructor Buildings," to be delivered not later than noon on July 26.

July 26. Minehead.—*Erection of three houses and Garage*, in the Parks, Minehead, for J. K. Heard, Taunton. Sealed tenders to be left with W. J. Tamlyn, architect, Minehead, not later than July 26. For plans and further particulars apply to W. J. Tamlyn.

July 27. Orion.—*Erection of ante-room* to Inchberry Public Hall, Orton. Plans and specifications may be seen with A. B. Hunter, chairman of Inchberry Hall Committee, Orton Station, with whom offers, endorsed "Ante-Room," may be lodged on or before July 27.

July 27. London, S.E.—*Erection of a branch library* in London Street, West Greenwich, according to the drawings, specification, and conditions of contract and bond, which may be seen at the office of Wills & Anderson, architects, 24, Bloomsbury Square, London, W.C., between the hours of 10 and 12 on July 18, 19, and 20, 1906. Bill of quantities, prepared by Fowler & Hugman, F.R.S.I., may be obtained of the town clerk, Town Hall, Greenwich, upon payment of a deposit of £2 2s. The tenders, on the form supplied, sealed and endorsed "Tender for Branch Library," must be delivered to the Town Clerk, not later than 12 o'clock noon on July 27, 1906. Fair wages clause.

July 28. St. Annes-on-the-Sea.—*Technical School* at St. Annes-on-the-Sea, for the Urban District Council. Plans may be seen and bills of quantities obtained from the office of the county architect, Henry Littler, 16, Ribblesdale-place, Preston, by payment of a deposit of £2. Sealed tenders, endorsed "Technical School," must be sent so as to reach T. Bradley, Public Offices, St. Annes-on-the-Sea, not later than 12 o'clock noon on July 28.

July 28. Pontycymmer.—*Erection of a school hall* at Pontycymmer, for the English Calvinistic Methodist Church. Plans and specifications may be seen with Owen Jones, Saddler, Pontycymmer, or A. L. Thomas, architect and engineer, Church Street Chambers, Pontypridd. Sealed and endorsed tenders to be sent to Owen Jones on or before July 28.

July 28. Exeter.—*Erection of an elementary school for girls and infants* in St. James's Road, Exeter, in accordance with drawings and specifications which may be seen at the offices of James Jerman, F.R.I.B.A., architect and surveyor, Bedford Circus, Exeter, for the City Council. Bills of quantities may be obtained on payment of the sum of £1 1s. Tenders endorsed "Tender for St. James's School," to be sent to H. L. Parry, town clerk, Exeter, on or before July 28.

July 29. Youghall—*Erection of nine houses* for the accommodation of the working classes, on Cork Hill, including the drainage, water supply, fencing and roadway, according to plan and specification (amended in red ink by the town surveyor), which can be seen at the town hall between the hours of 11 a.m. and 4 p.m., for the Urban District Council. Each tender must be accompanied by a schedule giving the quantities and prices upon which said tender in founded. Contractors must examine the site before tendering, as no extras will be allowed under any circumstance. Each tender is to be on the prescribed form (to be obtained from J. J. O'Shea, clerk, Urban District Council, Town Hall, Youghal), and is to contain the genuine signatures of two solvent persons willing to enter into a joint and several bond for the due execution of said works within the time specified. This bond and contract is to be prepared by the Council's Law Adviser and paid for by the contractor. Tenders, endorsed "Tender for the Housing of the Working Classes," addressed to the Chairman, Town Hall, to be sent through the Post Office not later than July 29.

July 30. Warrington.—*A light telescopic ladder tower* for emergency work for the Electricity and Tramways Committee. Particulars and specification can be obtained on application to F. V. L. Mathias, A.M.I.E.E., Borough Electrical and Tramways Engineer, Howley, Warrington. Tenders must be sealed with wax, endorsed "Tender for Telescopic Ladder," and delivered not later than 12 o'clock noon on July 30, 1906, addressed to the Chairman of the Electricity and Tramways Committee, Town Hall, Warrington.

July 30. Glasgow.—*Sponge cloth laundry* at St. Rollox Stores. The drawings may be seen at the office of the company's engineer, Buchanan Street Station, Glasgow. where copies of the specification and schedule may be obtained on payment of £2 2s. Sealed tenders, endorsed "Tender for Construction of Sponge Cloth Laundry at St. Rollox," to be lodged with J. Blackburn, secretary, Caledonian Railway Company's Offices, 302, Buchanan Street, Glasgow, on or before July 30.

July 31. Derby.—*Enlargement of the branch post office* at Midland Road, Derby. Drawings, specification, and a copy of the conditions and form of contract may be seen on application at the Midland Road Branch Post Office, Derby, between the hours of 10 a.m. and 4 p.m. Bills of quantities and forms of tender may be obtained of the Secretary, H.M. Office of Works, Storey's Gate, London, S.W., on payment of £1 1s. Tenders must be delivered before 12 o'clock noon on July 31, addressed to the Secretary, H.M. Office of Works, &c., Storey's Gate, London, S.W., and endorsed "Tender for Derby Branch Post Office Enlargement."

July 31. West Hartlepool.—*Construction of steps* leading from the Longhill subway to the proposed road, in accordance with plans, sections, and specification to be seen, and approximate quantities obtained of N. F. Dennis, Borough Engineer and Surveyor, Municipal Buildings. Tenders, endorsed "Construction of Steps, Longhill Subway," and addressed to the Chairman of the Works Committee, are to be delivered at the office of the Town Clerk, 78, Church Street, not later than 4 p.m., on July 31.

July 31. Wolverhampton.—*Erection of additions to the administrative block* at the fever hospital in Green Lane. Plans may be seen, and specifications, bill of quantities, and form of tender obtained on application to G. Green, Borough engineer, Town Hall, Wolverhampton, upon payment of a deposit of £1 1s. Tenders, addressed to the chairman of the Health Committee, to be delivered at the Town Clerk's Office by 10 a.m. on Tuesday, July 31. (Fair wages clause.)

July 31. Rothwell Haigh.—*Erection of an engine-house and pump-room* at their new workhouse, Rothwell, Haigh, in accordance with the drawings and specifications prepared by W. E. Richardson, architect, Rothwell, near Leeds. Applications for bills of quantities and forms of tender must be made to the architect on or before July 21, and bills of quantities will be supplied to such applicants only. Drawings may be inspected at the offices of the architect, and tenders, on forms provided, must be delivered to F. W. Mee, Union Offices, Hunslet, Leeds, by 10 o'clock on Tuesday, July 31.

Aug. 1. Pontypridd.—*Erection of a large chapel and schoolroom* for the English Baptist Church at Hopkinstown, Pontypridd. Plans and specifications may be seen of A. L. Thomas, A.M.I.C.E., architect and engineer, Church Street Chambers, Pontypridd. Sealed and endorsed tenders to be sent to the Rev. Samuel Davies, Oakfield, Pwllgwaun, Pontypridd, on or before Aug. 1.

Aug. 2. Alnwick.—*Erection of new residence* at Alnwick for Wm. Percy, Esq. The plans and specifications may be seen of G. Reavell, Junr., Alnwick, and the tenders, duly endorsed, must reach him not later than noon, August 2.

August 15. Lostock Hall, near Preston.—*Erection of a new Public Elementary School* at Lostock Hall, near Preston. The plans may be seen and bills of quantities obtained at the office of Henry Littler, county architect, 16, Ribblesdale Place, Preston, by payment of a deposit of £2. Tenders must be delivered before 12 o'clock noon on August 15, 1906, sealed and endorsed, to W. S. Woodcock, Esq., Council Offices, Bamber Bridge, near Preston.

No date. Sherborne.—*Small one-storey lace factory* at Sherborne. Builders desirous of tendering apply by letter to W. H. Radford, C.E., Albion Chambers, Nottingham.

SANITARY.

July 19. Stockport.—*Manual and team labour and materials required in sewering* the following streets within the Borough: Longford Road, Lewis Road, Welland Street, Denstone Road, Tyrrell Road. Plans, sections, specifications, and conditions may be seen, and forms of tender obtained, on application to J. Atkinson, Borough Surveyor's Office, Stockport. Tenders, addressed "The Borough Surveyor, Stockport," sealed and endorsed "Tender for Sewering Longford Road, &c.," to be left at his office at or before noon on July 19. Fair wages clause.

July 23. London, N.—*Construction of a 12-in. and 9-in. surface-water sewer* and appurtenant works in Hendon Lane and Waverley Grove of about 520yds. in length. The proposed works to be constructed in accordance with drawings, specifications, &c., which may be inspected at the offices of the engineer and surveyor to the Council, at Church End, Finchley. Copies of the specification and schedules, together with form of tender, may be obtained from the engineer on application, accompanied with a deposit of £2. Sealed tenders, endorsed "Hendon Lane, &c., Sewer," and addressed to E. H. Lister, clerk to the Council, Council Offices, Finchley, N., to be sent not later than 5 o'clock on July 23.

July 23. London, W.—*Barging away house refuse and road sweepings* from their Wharf at Lots Road, Chelsea, for the period commencing 1st October, 1906, and ending 31st March, 1908, and for an optional period thereafter of two or four years. Proposals must be made upon and strictly in accordance with the printed form of tender, which may be obtained, with further particulars, on application at the Town Hall, Kensington High Street. The party whose tender is accepted will be required to enter into a written contract and provide two good and sufficient sureties in the sum of £500 for the due performance thereof. The expense of the contract will be borne by the Council. Fair wages clause. Tenders, sealed and endorsed "Tender for Barging Work," must be delivered to W.C. Leete, town clerk, Town Hall, Kensington, W., not later than 4 o'clock in the afternoon of July 23, 1906. Parties submitting tenders must, when delivering their tenders, deposit with the borough treasurer, at the Town Hall, Bank of England notes to the value of £25 as a guarantee of good faith (the deposit, however, not to be enclosed with the tender).

July 24. Bromley.—*Sewering, levelling, paving, metalling, channelling, and making good streets*, known as Albert Road, Devonshire Square and Sandford Road, situate within the Borough, in accordance with plans, sections, and specifications prepared by the borough engineer, which may be seen, and bills of quantities, &c., obtained, on payment of 10s. 6d., of F. H. Norman, town clerk, Bromley, Kent. Tenders, endorsed, "Tender for Works of Street Improvement," must be delivered to F. H. Norman, not later than 3 o'clock on July 24, 1906.

July 25. Dartford, Kent.—*Building cesspool and constructing new drainage* for four cottages and gate porter's lodge, at Gore Farm Convalescent Hospital, Dartford, Kent, in accordance with drawing and specification prepared by W. T. Thatch, M.Inst.C.E., M.I. Mech.E., engineer-in-chief. Drawing, specification, conditions of contract, and form of tender may be inspected at the office of the Board, Embankment, E.C., and can then be obtained upon payment of a deposit of £1. Tenders, addressed as noted on the form, must be delivered at the office of the Board not later than 10 a.m. on July 25, 1906.

July 25. Barrow-in-Furness.—*Construction of the following lengths of surface-water sewers* inclusive of all manholes, lampholes, gullies and connections and outfalls. Sewer No. 1.—422 yards lineal 3ft. by 2 ft. egg-shaped brick sewers. Sewer No. 2.—687 yards lineal 5ft. 9in. by 3ft. 10in. egg-shaped brick sewers; 120 yards lineal 4ft. 3in. by 2ft. 10in. egg-shaped brick sewers; 338 yards lineal 4ft. by 2ft. 8in. egg-shaped brick sewers; 260 yards lineal 3ft. 3in. by 2ft. 2in. egg-shaped brick sewers; 220 yards lineal 3ft. by 2ft. egg-shaped brick sewers. Pipe sewers.—100 yards lineal 21in. stoneware pipe sewer; 40 yards lineal 18in. stoneware pipe sewer; 170 yards lineal 15in. stoneware pipe sewer; 120 yards lineal 12in. stoneware pipe sewer; 120 yards lineal 9in. stoneware pipe sewer. Also for certain works in filling up existing brick sewers. Plans and sections may be seen at the borough engineer's office, and copies of specification and bills of quantities and forms of tender obtained on application to the borough treasurer upon payment of the sum of £5. Tenders and fully priced bills of quantities, each in a separate properly sealed envelope, endorsed "Tender for Surface Water Sewers," must be delivered at the Town Clerk's Office not later than 12 o'clock noon on July 25.

July 27. Dunham Massey.—*Construction of the following works of sewerage*, within the township of Dunham Massey:—1,170 lineal yards or thereabouts of 18-inch diameter stoneware pipe and concrete sewer between Lowerhouses and Broadheath; 80 lineal yards or thereabouts of 15-inch diameter stoneware pipe and concrete sewer, and 36 lineal yards or thereaaouts of 15-inch diameter cast-iron pipe and concrete sewer under the railway at the cattle bridge, 500 yards or thereabouts west of the Broadheath station on the L. & N.W. railway, together with all shafts, manholes, and other appurtenant works in connection therewith for the Bucklow Rural District Council. Plans, sections, detail drawings, and specification can be seen, and bill of quantities with form of tender and any other information obtained on application to J. P. Wilkinson, M.Inst.C.E., 301, Cathedral Street, Manchester, and on deposit of the sum of £2 2s. Sealed tenders, endorsed "Dunham Massey Sewerage, Contract No. 4," must be addressed and delivered to G. Leigh, clerk to the Urban District Council, Union Offices, Knutsford, Cheshire, not later than 10 o'clock a.m., on July 27, 1906.

July 30. Chadderton.—*Construction of earthenware and cast-iron pipe sewers*, &c., for the sewerage of the Middleton Junction District. Drawings and specifications may be seen, and quantities, Form of tender, and all other particulars obtained, on application at the offices of James Diggle & Son, civil engineers, Hind Hill Street, Heywood, and 14, Victoria Street, Westminster, S.W., on payment of a sum of £3. Tenders, endorsed "Tenders for Middleton Junction Sewerage, Contract No. 14," to be sent to H. Hoyle, clerk to the Council, Town Hall, Chadderton, not later than July 30.

July 30. Beckenham.—*Extension of Dust destructor and also for repairs and alterations to the existing cells* for the Urban District Council. Particulars and forms of tender may be obtained on application to John A. Angell, surveyor, on the production of a receipt from the collector (who attends at his office daily from 9 to 10 a.m. only, except on Tuesdays, when his hours are from 9 a.m. to 1 p.m.) for a deposit of £2. Tenders, duly sealed and endorsed "Tenders for Dust Destructors," to reach F. Stevens, clerk to the Council, not later than 4 p.m., July 30. Fair wages clause.

July 31. London, S.W.—*Construction of filter beds* at Barn Elms, in the Western District. Forms of tender and contract, with specification, may be obtained on application to the District Engineer, Commercial Road, Pimlico, on production of an official receipt for the sum of £5. Such payments and applications must be made between the hours of 10 and 4 (except on Saturdays). Tenders, enclosed in sealed envelopes, addressed to the Clerk of the Board, Metropolitan Water Board, Savoy Court, Strand, W.C., and endorsed "Tender for Filter Beds, Western District," must be delivered at the Offices of the Board, not later than 10 a.m. on July 31, 1906.

August 5. Edmonton, Alta, Canada.—*Destructors for the City Sanitary Deparment.* Present population approximately 12,000. Propositions and plans to be fully descriptive of capacity, &c., with arrangements for readily extending the plant. Tenders with plans addressed "City Commissioners, Edmonton," to be delivered not later than August 5, 1906, to Geo. J. Kinnaird, secretary-treasurer, Edmonton.

ENGINEERING.

July 19. Hull.—*Construction of a covered concrete service reservoir* at Keldgate, to hold about 10 million gallons. Fair wages clause. Drawings may be seen and copy of specification and form of tender may be obtained at the office of F. J. Bancroft, City water and gas engineer, Alfred Gelder Street, Hull, on payment of £2. Cheques and postal orders to be made payable to T. G. Milner, city treasurer, Hull. Tenders endorsed "Tender for Covered Service Reservoir," are to be addressed to the Chairman of the Water and Gas Committee, and delivered at the town clerk's office not later than July 19.

July 20. Oran (Algeria).—*Water-supply works* for the town, 82,000 francs, deposit 2,200 francs. Apply to Prefecture, Oran, July 20.

July 20. Alberique (Spain).—*Electric lighting of the town.* Apply to Alcaldia Constitucional, Alberique, Valencia, by July 20.

July 23. Delamere (Cheshire).—*Construction of covered reservoir in concrete* of a capacity of 200,000 gallons; erection of pumping station and caretaker's house; erection of stone boundary wall enclosing the site; enlarging two boreholes from a diameter of 18in. to 20in. to a depth of about 60ft.; quarrying of stone and provision of plant for same, at the quarry on the Crown land adjoining the site; laying about 12 miles of 8in. water mains, in four sections of three miles each, or thereabouts, from the site to Middlewich, for the Middlewich Urban District Council, at their waterworks site, Delamere, Cheshire. Further particulars and specifications can be obtained on application by letter to Frederick William Stocks, engineer, Town Hall, Middlewich. Sealed tenders endorsed respectively "Reservoir," "Pumping Station, &c.," "Boundary Wall," "Boreholes," "Quarrying," or "Laying Water-Mains," to be delivered to C. F. Lawrence, clerk, Town Hall, Middlewich, before 10 a.m., on July 23.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, *Great New Street, Fetter Lane, E.C.*

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

July 23. London, S.E.—*Laying on an electric light wiring installation* at the two underground conveniences, Sutton Street, St. George-in-the-East. Persons tendering must submit the names and addresses of two substantial persons willing to be jointly and severally bound for the due and proper performance of the contract. Fair wages clause. Contractors will be prohibited from assigning or underletting their contract to anyone without having previously obtained the written consent of the Council thereto. The drawings may be seen, and copies of the stipulations, specifications, schedule, and form of tender may be obtained by applying to M. W. Jameson, borough engineer, 15, Great Alie Street, Whitechapel, E., between 10 a.m. and 12 noon, upon paying £1 deposit. Tenders, endorsed "Tender for Electric Light Installation, Underground Conveniences, Sutton Street," should be sent to G. W. Clarke, 15, Great Alie Street, Whitechapel, E., in the envelope supplied, so as to arrive on or before 12 o'clock noon on July 23.

July 24. Cowes (I. of W.) Urban District Council.—*Construction and erection of a steel bridge over railway.* Apply to J. W. Webster, engineer's office, July 24.

July 24. Featherstone.—*Works, &c., required in widening the bridge*, carrying Common Side Lane over the railway at Featherstone, for the Directors of the Lancashire & Yorkshire Railway. Plans can be seen, and form of tender and specification obtained on application at the Engineer's Office, Hunt's Bank, Manchester. Tenders, endorsed "Tender for Widening Bridge at Featherstone," to be in the hands of R. C. Irwin, secretary, Hunt's Bank, Manchester, not later than 10 o'clock on July 24.

July 24. London, W.—*Rebuilding of Perivale Bridge, Greenford Road.*—The drawings and specifications may be seen and forms of tender, together with bill of quantities and other particulars may be obtained from Charles Jones, M.Inst.C.E., borough engineer, Town Hall, Ealing, W., any day during office hours, upon payment of a deposit of £2 2s. Sealed tenders, in the envelopes provided, endorsed "Tender for Re-building Perivale Bridge," must be delivered to G. E. Brydges, town clerk, Town Hall, Ealing, W., not later than 9.30 a.m. on July 24.

July 25. Rainhill.—*Plant* for the County Asylum, as follows:—(*a*) *One independent surface condensing plant with electrically-driven pumps, together with the necessary pipework.* (*b*) *One water softening and purification plant.* Plans and works may be seen, conditions, specification and form of tender may be obtained from the Engineer's Office at the Institution. Tenders to reach J. Gornall, clerk's office, County Asylum, Rainhill, not later than 5 p.m. on July 25 endorsed on the outside "Water Softening."

July 25. Sutton, Surrey.—*Installation of Electric Lighting* at the Downs School, Banstead Road, Sutton, Surrey, in accordance with drawings and specification prepared, by W. T. Hatch, M.Inst.C.E., M.I.Mech.E., engineer-in-chief. Drawing, specification, conditions of contract, and form of tender may be inspected at the office of the Board, Embankment, E.C., and can then be obtained upon payment of a deposit of £2. Tenders, addressed as noted on the form, must be delivered at the office of the Board, not later than 10 a.m. on July 25.

July 25. Middelburg (Holland).—*Canal construction works*, 960,000 florins. Apply to Provincial Government, Middelburg, July 25.

July 25. Norwich.—*Erection of new boiler house, seating for boilers, and economiser*, at the Norwich Workhouse. Plans and conditions of contract may be seen, and bills of quantities obtained on payment of £1 1s. at the offices of Morgan & Buckingham, architects and surveyors, 3, Redwell Street, Norwich. Sealed tenders, endorsed "Tender for Boiler House," to be delivered to H. Stone, Guardians' Office, St. Andrew's Street, Norwich, not later than 3 o'clock on July 25. Fair wages clause.

July 27. Sunderland.—(*a*) *Two 250-kw. synchronous motor generators, 5000—240 volts.* (*b*) *High tension and low tension switchgear for the electricity department.* The specifications and forms of tender can be obtained on application to the Borough Electrical Engineer, J. F. C. Snell, M.Inst.C.E., Town Hall, Sunderland, and on payment of a deposit of £1 1s. for each specification. Sealed tenders addressed to the "Chairman of the Electricity and Lighting Committee," Town Hall, Sunderland, must be delivered to F. M Bowey, Town Hall, Sunderland, not later than 12 o'clock noon on July 27. Tenders to be endorsed "A" or "B" according to the item tendered for.

July 30. Stanley and West Hallam.—*Waterworks at Stanley and West Hallam*, Derbyshire, including laying 4,466 yards of 6in., 3,050 yards of 4in., and 1,910 yards of 3in. cast iron pipes, with all appurtenances, and the construction of a brick service reservoir (capacity 90,000 gallons). Plans may be seen and specification and bills of quantities obtained, at the offices of Elliott and Brown, engineers, Burton Buildings, Parliament Street, Nottingham, after July 16, 1906, on deposit of £2 2s. Sealed tenders, addressed to J. W. Newbold, Council Offices, Derby, and endorsed "Tender for Waterworks," to be delivered on or before the first post on July 30, 1906.

July 31. Shanghai.—*For the supply and delivery c i.f. Shanghai of the following plant:*—for the Municipal Council. *a.*—Two 600 kilowatt Steam-Turbo Dynamos, or, as an alternative, Two 600 kilowatt Steam Dynamos, together with Condensing Plant, certain Pipes and Valves, Motor-Generator, Switchboards, &c. *b.*—Two Water-tube Boilers, with Feed-water Heaters, Superheater and Chain-grate Stokers, Feed Pump, Pipes, Valves, &c. Specifications, general conditions, and forms of tender can be obtained from Preece & Cardew, 8, Queen Anne's Gate, Westminster, S.W., on payment of a deposit of £2 for each section. Extra copies of the specification and general conditions for each section can be obtained on payment of 5s. each (non-returnable). Sealed tenders, endorsed "Shanghai Electricity Supply," are to be addressed to Preece & Cardew, 8, Queen Anne's Gate, Westminster, S.W.. and delivered before 12 o'clock noon on July 31.

Sept. 4. Lancaster.—*Proposed reconstruction of steam heating arrangements and hot-water service.* The last date for receiving tenders for the above work has been extended to Sept. 4. Contractors please note. J. T. Cheetham, clerk and steward.

No date. Workington.—*Heating of Victoria Infant School* by hot water (radiators and piping) are requested to send in their names to E. J. Hepworth, secretary, Education Offices, Workington, as early as possible.

PAINTING AND PLUMBING.

July 19. Culmstock.—*External and internal painting*, &c., of the School House and School, according to specification to be seen at the School between 9 a.m. and 5 p.m., Saturday excepted. Tenders must be received by R. W. Beadon, Woodgate, near Wellington, before 9 on July 19.

July 20. Chartham Downs, Kent.—*Painting, repairs*, &c., and other works in connection therewith to Section No. 3. The Specifications can be seen at the Office of W. J. Jennings, Architect, 4, St. Margaret's Street, Canterbury, and copies of the bills of quantities obtained therefrom on depositing with him the sum of £5. Tenders to be delivered to the Asylum, addressed to the Chairman of the Committe of Visitors, not later than 10 o'clock on July 20.

No Date. Whittington.—*Painting and colouring, inside only, New Whittington and Whittington Moor Schools*, for the Derbyshire Education Committee, to be done during August. Apply for Specification, J. J. Creed, correspondent, Old Whittington, Chesterfield.

July 20. Norwich.—*Painting and other work* at Norwich Technical Institute. Stipulations of contract and specification may be seen and forms of tender obtained on application to A. E. Collins, city engineer, Guildhall, Norwich. Tenders on the forms supplied, enclosed in envelopes sealed with sealing wax, endorsed "Painting," and addressed to the Chairman of the Higher Education Sub-Committee, must be delivered to A. E. Collins, not later than 2.30 p.m on July 20.

July 24. Birkenhead.—*Painting the Woodside ferry building and approaches.* Further information, specifications, and forms of tender may be obtained on application at the office of the Ferries Manager, Woodside Ferry, Birkenhead. Tenders (which must be on the printed form supplied) sealed and endorsed "Tender for Painting Ferry Buildings," must be sent in to A. Gill, town clerk, Town Hall, Birkenhead not later than 5 o'clock in the afternoon of July 24, 1906.

IRON AND STEEL.

July 24. London, E.C.—*Supply of steel bridges*, 12 to 70ft. spans, about 1340 tons, for the South Indian Railway Company, Ltd. Specifications and forms of tender may be obtained at the company's offices. Tenders, addressed to the Chairman and Directors of the South Indian Railway Company, Ltd., and marked "Tender for Bridges," must be left with H. W. Notman, company's offices, 55, Gracechurch Street, E.C., not later than 12 noon on July 24. A charge will be made of 20s. for each copy of the specification. Copies of the drawings may be obtained at the office of Sir George B. Bruce, 3, Victoria Street, Westminster, on payment of 5s. per sheet.

July 26. Dublin.—*Supply of* 5500 *tons steel rails*, 400 *tons steel soleplates*, 150 *tons steel fishplates*, invited by the Directors of the Great Southern and Western Railway, in accordance with the specifications, which can be obtained on application to the Company's Engineer, Inchicore, Dublin. The specifications for the rails (2), fishplates (2) and soleplates are upon separate forms, and a charge of 5s. will be made for each specification. Tenders, which must be made on the form attached to the specification, must be delivered to F. B. Ormsby, Kingsbridge Terminus, Dublin, endorsed "Tender for Rails, &c.," before 10 a.m. on Thursday, July 26

July 30. West Hallam.—*Supply and free delivery at West Hallam, Derbyshire, of cast-iron pipes, special castings, &c.*, in connection with the water supply of Stanley and West Hallam, near Ilkeston, for the Shardlow Rural District Council. The contract will comprise about 186 tons of 6in. pipes, 76 tons of 4in. pipes, and 35 tons of 3in. pipes. Full particulars, with specification, bills of quantities, and form of tender, may be obtained from Elliott & Brown, engineers, Burton Buildings, Parliament Street, Nottingham, on deposit of £2 2s. Sealed tenders, addressed to J. W. Newbold, Council Offices, Becket Street, Derby, and endorsed "Tenders Iron Pipes," to be delivered on or before July 30, 1906.

Aug. 2. Ashford, Middlesex.—*Supply Delivery, and erection on their premises at Ashford, Middlesex, of the following plant and materials* for the Managers of West London District Schools. Contract No. 1.—Pipework and sundry apparatus for Exhaust Steam Heating System. Contract No. 2.—Pipe Trenches and sundry Builder's Work. Contract No. 3.—Chimney Shaft, Economiser Chamber, and Flues. Contract No. 4.—Two 50 kw. Steam Dynamos (high-speed D.A. vertical compound engines), and Boosters, an Electric Motor, Additions and Alterations to Switchboard, some 200 yds. of Cable, and sundry other work. Contract No. 5.—Alterations and extensions to Steam, Exhaust, Feed and Drain Pipes, a Green's Economiser, &c. Copies of the general conditions applicable to all the contracts, the specifications, drawings, and forms of tender may be obtained by application to F. G. Beeching, clerk to the managers, Ashford, Middlesex, at the schools, on payment of a deposit of £3 3s. for each section. Copies of the above-mentioned documents may be seen (but not obtained) at the offices of F. H. Medhurst & Lloyd, consulting engineers, 13, Victoria Street, Westminster, from whom all particulars of the work may be obtained. Persons tendering may inspect the schools on week-days, between the hours of 10 a.m. and 4 p.m. The tenders must be delivered to F. G. Beeching (as per instructions with the forms) not later than 6 p.m. on Thursday, Aug. 2.

MISCELLANEOUS.

July 20. London, W.—*Supply to their electricity works of best cylihder oil, crank-chamber oil, paraffin engine oil, best rope waste, and stoneware pipes*, for the Town Council of the Borough of Ealing. Tender forms and full particulars can be obtained on application to A. E. Lewis, A.C.I.S., Electricity Department, Town Hall, Ealing, W., and must be delivered not later than noon, July 20, 1906.

ROADS AND CARTAGE.

July 19. Edinburgh.—*Whinstone paving in the carriageways of*:—(1) Appin Terrace; (2) Roseburn Place; and (3) Lane at 5 East Preston Street; also for concrete paving in carriageways of:—(4) Springvalley Terrace, and (5) Gibson Street; also for granolithic footways at:—(6) Arboretum Road and Kinnear Road. Plans may be seen, and schedules of quantities and specifications obtained, on application to the City Road Surveyor, City Chambers. Tenders, sealed within the official envelopes supplied, must be lodged with the subscriber by 10 a.m. on July 19.

July 20. Manchester.—*Execution of the following work*:—Sewering, draining, paving, &c.; Side Street, Clayton, North Manchester. Sewering, draining, paving, &c.; Colville Street, Newton Heath, North Manchester. Sewering, draining, paving, &c.; Grey Street, Newton Heath, North Manchester. Reconstruction of 18-in. pipe sewer in Stuart Street, from Mill Street to Cavendish Place, Bradford, North Manchester. Construction of sewer, Eileen Grove, &c., Rusholme, South Manchester. Sewering, draining, paving, &c., passage behind 1 to 21, Hora Street, and adjoining 21 and 23, Hora Street, and 2, Freda Street, Bradford and Ardwick, North and South Manchester. Forms of tender may be obtained on application to the Paving, &c., Department (surveyor's office), and must be returned to the Chief Clerk, Paving, &c., Department, Town Hall, Manchester, before 10 a.m. on July 20.

July 23. Waltham Holy Cross.—*Making up of Fairmead Road, High Beech*, for the Urban District Council. Plans and specifications may be seen on application to W. T. Streather, Town Hall, Waltham Abbey. Tenders, in envelopes supplied, to reach the office of F. C. E. Jessopp, clerk to the Council, by 12 noon on July 23.

July 23. Cheshunt.—*Construction of a 40ft. road* about 600ft. long, situated in the Manor House Grounds, Cheshunt. The plan and specification can be seen and forms of tender obtained from R. H. Jeffes, Engineer and Surveyor to the Council, Manor House, Cheshunt. Persons tendering must take off their own quantities. Sealed tenders, in envelopes supplied, and addressed "Chairman, Cheshunt Urban District Council," to be delivered at or before 4 p.m., July 23.

July 24. London, N.W.—*Execution of certain road-making and paving works* in the following: Lushington Road, Harlesden; Drayton Road, Harlesden; Lydford Road, Willesden Green. Plans and specifications may be seen, and all further particulars obtained, upon application to O. Claude Robson, M.Inst.C.E., engineer to the Council, Public Offices, Dyne Road, Kilburn, N.W. The Tenders, upon printed forms, and endorsed "Private Streets," to be delivered at the offices of the Council not later than 4 p.m. on July 24. A £10 note to be deposited with each tender.

July 25. Heanor.—*Compound ten tons steam road roller*, to be delivered on or before September 29, for the Urban District Council. Tenders, with drawings and specifications attached, endorsed "Tender for Steam Roller," to be sent to John Holbrook, surveyor, Town Hall, Heanor, Derbyshire, by sixo'clock, on July 25.

July 25. Neath.—*Supply of* about 900 tons of granite (or other approved) metalling, chippings, and siftings, and about 500 tons of limestone, metalling, and screenings. Copy of specification may be obtained on application to D. M. Jenkins, borough engineer, Gwyn Hall, Neath, to whom sealed tenders, endorsed "Tender for Road Metalling," are to be delivered on or before July 25.

July 25. Wanstead.—*2,000 tons (more or less) of Guernsey granite or Quenast stone*, broken to 1½in. cube, delivered to Snaresbrook Station (G.E. Ry.) by such instalments and in such quantities as may be directed in writing from time to time by the Council's surveyor, beginning Sept. 1 next. Forms of tender can be obtained on application to the Surveyor at the Council Offices. Tenders, sealed and enclosed in the envelopes provided, are to be delivered at the Council Offices not later than Wednesday, July 25. Payment will be made as follows—viz.: 50 per cent. at the Council meeting in January, 1907; 50 per cent. at the Council meeting in July, 1907.

July 25. Ticehurst.—*Steam rolling* in their district as from the first week in November, 1906. The contractors will be required to supply one or more rollers with driver and mate to each, scarifiers, sleeping-vans, water-carts, with horse and man to each, and all necessary appliances. The work to be undertaken either by the piece or by daywork, as the Council may determine. Forms of tender may be obtained from W. N. Wood, surveyor, Ticehurst, on a stamped addressed foolscap envelope being forwarded. Tenders, sealed and endorsed "Steam Rolling," mustbe sent so as to reach J. C. L. Andrews, clerk to the Council, Wadhurst, Sussex, not later than July 25.

July 25. Wanstead, N.E.—*Ten ton steam roller with driver*, attendant, fuel, &c., to work in the district during the months of September, October, November, and December, 1906, for the Urban District Council. Forms of tender, with further particulars, can be obtained on application to C. H. Bressey, surveyor, Council Offices, Wanstead. Tenders, sealed and enclosed in the envelopes provided, are to be delivered at the Council Offices not later than July 25.

July 26. Wallsend.—*Macadamising, kerbing, cementing, &c.*, certain roads. Plans and specifications may be seen and forms of tender obtained on application to G. Hollings, borough surveyor, corporation offices, Wallsend. Tenders, sealed, and endorsed "Tender for new streets, &c.," to be received by W. V. Mulcaster, 28, Sandhill, Newcastle-on-Tyne, on or before noon of July 26.

July 28. London, W.—*Execution of the following contracts* for the Paddington Borough Council No. 25B.—Renewal with 8in. or 9in. by 3in. by 5in. Creosoted deal wood blocks of existing wood paving in Edgware Road (all materials and labour; about 3,650 super yards). No. 25C.—Renewal with 9in. by 3in. by 4in. West Australian hardwood blocks of existing wood paving in Praed Street (all materials and labour; not more than 5,100 super yards. No. 51.—Purchase of old West Australian hardwood blocks to be taken up from the areas above mentioned. No. 2.—Construction of a sewer with manholes, lampholes, drain connections, and contingent works and accessaries in Queen's Gardens. Printed conditions, specifications, schedule and bills of quantities, and forms of tender may be obtained on application between the hours of 10 a.m. and 4 p.m. (Saturdays 10 a.m. and 1 p.m.) at the office of or by letter addressed to the Borough Surveyor, Town Hall, Paddington, W. In the case of contract No. 52 a payment of £1 must be made for a set of documents. No tender will be considered unless made strictly in accordance with and on one of the printed forms issued, and it must be sealed, endorsed according to the description of contract, and delivered at the Town Hall, Paddington, W., by July 28. Letters of enquiry respecting any of the above contracts should have the number of the contracts written in the left-hand corner of the outside of the envelope.

July 28. Lye and Wollescote.—*About 3,000 lin. yds. of Rowley granite kerbing, and 10,300 sup. yds. of granite sett paving*, to be laid on the Stourbridge and Halesowen main road, situate in the Urban District of Lye and Wollescote, for the Worcestershire County Council Highways and Bridges Committee. Drawings may be inspected, and specification, bill of quantities, and form of tender obtained, on application, and payment of a fee of £2 2s., to J. H. Garrett, Shire Hall, Worcester. Sealed tenders, marked "Tender for Granite Sett Paving," must be delivered to J. H. Garrett not later than 10 o'clock on July 28.

July 31. West Hartlepool.—*Construction of Bangor Street*, the passage-way leading from Clarence Road to Hart Road, on the north side of "The Willows," and the New Roadway, being diversion of Mainsforth Terrace to the westward, from Grantham Street to the Longhill Sub-way. Plans, sections, and specifications can be seen, and forms of tender, with approximate quantities obtained, upon application to N. F. Dennis, borough engineer and surveyor, Municipal Buildings. Tenders, endorsed "Construction of Streets, &c.," and addressed to the Chairman of the Works Committee, are to be delivered at the office of the Town Clerk, 78, Church Street, not later than 4 p.m. on July 31, 1909.

July 31. Mitcham, Surrey.—*600 tons of hard blue Guernsey granite spalls*, to be delivered in such quantities as may be ordered, free of all delivery charges and cartage, to the Workhouse, Western Road, Mitcham, Surrey, for the Guardians of the Holborn Union. The granite must be weighed as sent in, and the Workhouse weighbridge weights charged for. Tenders (by letter) must be delivered to J. A. Battersby, Holborn Union Offices, 53, Clerkenwell Road, E.C., not later than 12 o'clock noon, on July 31.

August 1. Litherland.—*About 250 tons of the best Welsh macadam, and about 25 tons of granite chippings*, during the ensuing twelve months for the District Council. The macadam and chippings to be delivered at the Alexandra or Langton Dock at such times and in such quantities as may be required. Samples must be forwarded carriage paid to A. H. Carter, surveyor, Public Offices, Sefton Road, Litherland, not later than Aug. 1. Specification and form of tender can be obtained on application to the Surveyor, any morning between 9 and 11 am. Tenders, endorsed "Tenders for Macadam and Chippings," to be sent to J. W. A. North, 15, Lord Street, Liverpool, not later than Aug. 1.

August 1. Widnes.—*Private improvemeut works* in each of six streets and nine passages situate at Simm's Cross. Plans, sections, and specifications may be seen and forms of tender with bills of quantities obtained at the office of John S. Sinclair, A.M.I.C.E., borough surveyor, Town Hall, Widnes, upon deposit of £2 2s. Tenders, sealed and endorsed "Tender for Private Improvement Works," to be sent, on forms supplied, to H. S. Oppenheim, Town Clerk's Office, Town Hall, Widnes, on or before August 1. Fair wages clause.

TOO LATE FOR CLASSIFICATION.

July 19. Edinburgh.—*Mason and Brick, Carpenter, Joiner, Plumber, Slater, Plaster and Cement Works* in connection with the Cottage proposed to be erected at Martyrs' Cross, near Glencorse, for the Edinburgh and District Water Trust. Schedules of Quantities may be had on application to E. C. Carse, architect, 37, Frederick Street, Edinburgh, at whose office plans of the proposed Cottage may be seen. Tenders endorsed "Cottage at Martyrs' Cross, Glencorse," must be lodged with W. Boyd, clerk to the Trust, 12, St. Giles' Street, Edinburgh, not later than July 19, at 10 a.m.

July 19. Huddersfield.—*Painting and decorating* of the Huddersfield Technical College. The successful tenderer will be required to execute a contract the draft of which may be inspected at the Town Clerk's Office, Town Hall, between 10 and 4 o'clock. Specifications and general conditions may be seen, and bills of quantities and forms of tender obtained, on application at the offices of the Borough Engineer and Surveyor, 1, Peel Street after the 11th inst. Sealed tenders, endorsed "Tender for Painting Technical College," signed in the handwriting of the tenderer or his agent, and addressed "Town Clerk, Town Hall, Huddersfield," must reach him not later than 10 a.m. on July 19.

July 20. Inverness.—*Additions to Farraline Park Public School*. Plans and specifications to be seen with W. Mackintosh, architect, Inverness, from whom schedules may be obtained, and tenders to be lodged with him by July 20, 1906.

July 21. Inverness.—*Block of Three Houses for Workmen* at Inchlea Crossing Loop, between Newtonmore and Dalwhinnie Railway Stations for the Highland Railway Co. Plans and specifications may be seen with W. Roberts, the Company's Engineer-in-Chief, at Inverness, or with the Station Agent at Kingussie. Sealed tenders, addressed to the Secretary of the Company, The Highland Railway Co.'s Office, Inverness, and marked on the outside, "Houses, Inchlea," to be lodged at his office on or before Saturday, July 21.

July 23. Huddersfield.—*Painting and other work at various schools*. General specification and conditions may be seen, and forms of tender, and short specification for each school, obtained on application at the offices of K. F. Campbell, M.Inst.C.E., borough engineer. Sealed tenders, endorsed, "Tender for Painting Mold Green School," or as the case may be, signed in the handwriting of the tenderer or his agent, and addressed "Town Clerk, Town Hall, Huddersfield," must reach him not later than 10 a.m. on July 23.

July 23. Kirkmichael.—*Renovation* of the Parish Church of Kirkmichael. Plans and specifications to be seen with J. Robertson, architect, Inverness; also copies of both plans and specifications to be seen with the Rev, Mr. Frazer, The Manse, Kirkmichael, Ballindalloch, and tenders to be lodged with Mr. Robertson, on or before July 23.

July 24. Stocksfield-on-Tyne.—*Painting* of the above-named school premises for the managers of the Broomley Council School. Forms of tender can now be obtained and specifications and conditions of contract seen at the schools, or at the office of W. H. Ord, solicitor, Swinburne Street, Gateshead, to whom tenders are to be delivered not later than July 24.

July 25. London, N.—*Painting certain portions of the outside* of workhouse at Edmonton, for the Guardians of the Edmonton Union. Specifications and forms of tender can be obtained at the Offices of Stuart Hill, architects, 106, Cannon Street, E.C., on deposit of £1 1s. Tenders, to be marked "Tender for Outside Painting," to be delivered to F. Shelton, clerk, Lower Tottenham, on or before 9 a.m., on July 25, 1906.

July 25.—*Cleaning and painting works* at Joyce Green Smallpox Hospital, Dartford, Kent, in accordance with specification prepared by Mr. W. T. Hatch, M.Inst. C.E., M.I.Mech.E., Engineer-in-Chief. Specification, conditions of contract, and form of tender may be inspected at the Office of the Board, Embankment, E.C., and can there be obtained upon deposit of £1. Tenders, addressed as noted on the form, must be delivered at the Office of the Board, not later than 10 a.m. on July 25, 1906.

Why cute builders use

JAPANOL

Pocket.

Pocket considerations are important. **JAPANOL** is more efficient and durable than any enamel paint ever invented. Value considered, it is cheaper than anything else on the market.

Convenience.

One coat of **JAPANOL** is better than three coats of ordinary enamel paint, and lasts for as many months as the other do weeks. Can't break, crack, or peel off. Once on, it's a good job well done!

JAPANOL is a paint—but a paint that words cannot do justice to. One coat against a dozen.

Cheap, easy to use, never cracks or peels, mirror-like surface, and practically everlasting wear.

Don't go by our words—go by the FREE SAMPLE.

Reputation.

The exquisite effects produced by the use of **JAPANOL** inspire a wealth of flattering opinions. People talk about it. It builds up a good repute for those who use it in their business.

Don't send an Order!

We only want you to try it at our expense. Your orders will come as sure as sunrise if you once see what **JAPANOL** is and what it can do.

Samples and full particulars post free from

CONCRETE AND STEEL SUPPLEMENT (MONTHLY)

THE DESIGN OF REINFORCED CONCRETE BRIDGES.

By Charles F. Marsh, M.I.C.E., A.M.I.M.E.

The employment of reinforced concrete has enabled engineers to design bridges which for lightness of construction and adaptability to the conditions of their sites can compare favourably with bridges previously constructed with any other material.

M. Considère, by the employment of hooped concrete, has produced a bridge at Plougastel of the cantilever and bowstring girder type, with spans of 317¾ feet, in which the members show no greater dimensions in elevation than would be necessary in a steel bridge of like design. A view of one span of this bridge is shown in Fig. 1.

The adaptability of reinforced concrete for arched bridges is well demonstrated in Fig. 2, which is produced from a photograph of a bridge constructed by M. Hennebique at Liège for the exhibition of 1905.

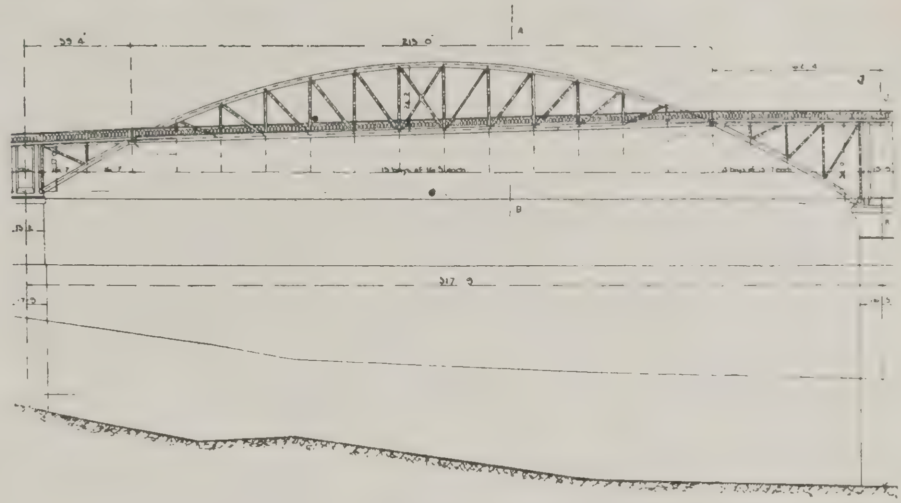

FIG. I.—BRIDGE AT PLOUGASTEL,

Two Classes of Bridges.

For the purpose of this article, two classes of bridges will be discussed—those with girder supports, and those formed with arches. Parallel flanged girder bridges may be designed with reinforced parapets and cross beams supporting the floor slab. This is an excellent method to employ, since headroom is economised and the parapets are employed to the greatest advantage. They may also be designed with reinforced main and cross beams below the decking when there is sufficient headway, the parapets being formed, in this case, of reinforced concrete or other material independent of the parts supporting the structure.

Fig. 3 is an example of the first type, the parapets being reinforced near the upper and lower surface throughout the longer span, where the area of concrete in compression was found to be too little to resist the compressive stresses. For the side spans, the parapets were only reinforced along the bottom, one series of rods being used at the top, round which the vertical shearing reinforcements were passed to form a secure attachment to the concrete near the upper surface.

The Concrete Mouldings

on the elevation of the parapets were formed for ornamental purposes, and the appearance of the bridge was thereby much improved.

The cross beams supporting the decking have reinforcements near the lower surface and a series of small bars along the top, over which the vertical shearing reinforcements are passed.

The decking is reinforced with longitudinal and transverse rods near the lower surface.

A Bridge of the Second Type

is shown by Fig. 4. In this case a series of main beams may be employed connected by cross beams of small span. In the bridge shown in the illustration the cross-beams were only placed under the roadway, there being none under the footways. The outside series of cross-beams shown on the plan are merely supports for gas and water pipes, &c., their purpose being more clearly shown in the cross-section.

The beams are reinforced near the upper and lower surfaces, since their depth is insufficient to give enough sectional area of concrete in compression to resist the stresses. The lower rods are tied to the upper surface by vertical shearing reinforcements. The parapets and string-courses are of terracotta, and are supported by a projecting ledge of reinforced concrete carried on reinforced corbels. The decking is reinforced by alternate straight and bent-up rods in the direction of the cross beams, a further set of straight rods in the direction of the main beams being inserted near the upper surface.

The two methods described above illustrate in a general manner the design of bridges supported by girders with parallel flanges, but these are necessarily altered in detail to suit every case.

(*To be concluded.*)

STEELWORK AT THE NEW "MORNING POST" BUILDING, LONDON. MEWES AND DAVIS, ARCHITECTS.

In former issues of this supplement we have published photographs showing the steelwork in course of erection at the new "Morning Post" building, at the Strand corner of Aldwych. We now supplement these with the above view, taken on Friday last, which shows the present condition of the work. This photograph was taken from the back of the site, looking towards the Strand. It will be recollected that the plan of the building is triangular, with the point of the triangle against the Strand frontage. The placing of the stanchions has been carefully worked out for easy erection, and it is obvious from the above view how this makes for economy and quick work. A detail view of the curved girders at the corner was published in our last supplement (June 20th).

STRESSES IN REINFORCED CONCRETE BEAMS.—III.

(*Continued from p. 28, No. 593.*)

T Beams.

WHEN spans are small reinforced concrete floors are constructed of even thickness, as simple beams or slabs supported at the ends or on all four sides as a panel. Where, however, wide spans are required, intermediate beams are called for as supports, it becoming obviously undesirable and uneconomical to increase the thickness to such an extent that the floor slab would be self-supporting. These beams are generally constructed monolithic with the floor slabs, and the former are assumed to be strengthened by the latter by forming with them **T**-shaped beams. The concrete of the floor slabs is itself calculated to take the maximum compression at the centre of their spans, and thus we cannot add an additional stress by expecting it to take the compression that would come from their acting as the top or table of the **T**. Towards the supports however, the concrete of the floor slabs is not stressed to the full, and may be relied upon to take the stresses due to their acting as part of the **T**-shaped beams. It is usual to reckon one-quarter of each floor slab as forming a portion of the **T**, as shown in Fig. 9 where B is the breadth of the **T**.

In this present article we shall use the same symbols as in the first article of this series in our issue for May 23, with a few additions, namely:

b = breadth of rib of **T** beam.
B = breadth of table of **T** beam.
d = depth of tensile reinforcement from top of beam.
D = depth or thickness of table of **T** beam.
y = distance from top of beam to neutral axis.
$d - y$ = distance from tensile reinforcement to neutral axis.
a = area of steel in tension.
E_s = modulus of elasticity of steel = 30,000,000.
E_c = modulus of elasticity of concrete = 3,000,000.
S_c = greatest stress in concrete in compression.
S_s = greatest stress in steel in tension.

If the neutral axis does not fall without the floor slab or below the table of the **T** the method of calculation given in the first article of this series exactly applies, it being only necessary to substitute B for b.

If, however, the neutral axis falls below the table of the **T** then we have to somewhat modify our previous calculations.

Fig. 10 shows a longitudinal section comparable with Fig. 3, while Fig. 11 is the adaptation of Fig. 4 to the altered case, the volume of the shaded portion showing the amount of compressive stress taken by the various portions of the beam. For the sake of simplicity we may neglect the small amount of compression taken by the rib of the **T** above the neutral axis just as we have previously neglected the amount of tension taken by the concrete below the neutral axis.

We see by Fig. 10, from the properties of similar triangles, that

$$S_c : x :: y : y - D.$$

$$\therefore \frac{S_c}{x} = \frac{y}{y - D}$$

$$\text{or } x = \frac{S_c(y - D)}{y} \quad \ldots\ldots \quad (18)$$

Equation (1) remains the same for this case,

$$i.e. \quad S_s = S_c \cdot \frac{E_s}{E_c} \cdot \frac{d - y}{y} \quad \ldots\ldots\ldots (1)$$

Equation (5) however requires modification to suit the altered conditions. Instead of $S_c \cdot \frac{by}{2}$ representing the contents of the shaded portion, we get $(S_c + x) . \frac{DB}{2}$

The equation therefore becomes

$$(S_c + x) . \frac{DB}{2} = S_s . a \quad \ldots\ldots\ldots (19).$$

Inserting the value for x in equation (18) and the value for S_s in equation (1) in equation (19) we obtain.

$$\left[S_c + \frac{S_c(y - D)}{y}\right]\frac{D.B}{2} = S_c \cdot \frac{E_s}{E_c} . \frac{d - y}{y} . a$$

$$\therefore S_c \cdot \frac{(2y - D)}{y} . \frac{D.B}{2} = S_c \cdot \frac{E_s}{E_c} . \frac{d - y}{y} . a$$

$$\therefore (2y - D) . \frac{D.B}{2} = \frac{E_s}{E_c} . (d - y) . a$$

$$\therefore yBD - \frac{BD^2}{2} = \frac{E_s}{E_c} \cdot ad - \frac{E_s}{E_c} \cdot ay$$

$$\therefore y\left(BD + \frac{E_s}{E_c} \cdot a\right) = \frac{BD^2}{2} + \frac{E_s}{E_c} \cdot ad$$

$$\therefore y = \frac{\frac{BD^2}{2} + \frac{E_s}{E_c} \cdot ad}{BD + \frac{E_s}{E_c} \cdot a} \quad \ldots\ldots\ldots (20)$$

To obtain the moment of resistance M_r we require to know where the line of resultant of the compressive stresses is situated. This passes through the centre of gravity of the shaded parallelogram in Fig. 10 which is situated $\frac{D}{3} . \frac{S_c + 2x}{S_c + x}$ from the top of the beam. Inserting the value of x from equation (18) this becomes

$$\frac{D}{3} . \frac{S_c + 2\frac{S_c(y - D)}{y}}{S_c + S_c\frac{(y - D)}{y}} = \frac{D}{3} . \frac{3y - 2D}{2y - D} = \frac{3Dy - 2D^2}{6y - 3D}$$

The moment of resistance is therefore

$$M_r = R_s\left[d - \frac{3Dy - 2D^2}{6y - 3D}\right] \quad . . . (21)$$

And as $R_s = S_s . a.$, by substituting the value of $S_s . a.$ in equation (19) we get

$$M_r = (S_c + x) . \frac{DB}{2}\left[d - \frac{3Dy - 2D^2}{6y - 3D}\right].$$

Substituting the value of x in equation (18) we get

$$M_r = \frac{S_c.(2y - D)}{y} . \frac{DB}{2}\left[d - \frac{3Dy - 2D^2}{6y - 3D}\right] . (22)$$

These equations give us all we require for designing because we have B, D, the load and bending moment (equal to the moment of resistance) all fixed. Thus taking, as before, $\frac{E_s}{E_c} = 10$, and the highest stresses concrete and steel will bear, and putting $y = zd$ we get:

From equation (1)

$$60{,}000 = 3{,}000 . 10 . \frac{d - zd}{zd}$$

$$\therefore 2z = 1 - z \quad \therefore z = \tfrac{1}{3} \text{ and } y = \tfrac{1}{3}d.$$

From equation (22)

$$M_r = \frac{3000(\frac{2}{3}d - D)}{\frac{1}{3}d} . \frac{DB}{2}\left[d - \frac{Dd - 2d^2}{2d - 3D}\right]$$

in which only d is unknown.

Having found d in this way, we can calculate a from equation (20) which becomes

$$\tfrac{1}{3}d = \frac{\frac{BD^2}{2} + 10ad}{BD + 10a.}$$

The breadth, b, of the rib, has to be sufficient to resist the shearing stresses, and therefore may be omitted for the present.

The working drawings, here published, illustrate the design for a coal pocket at Bevan's Portland cement Works at Gravesend, now being erected for the Associated Portland Cement Manufacturers, Ltd., by the Trussed Concrete Steel Co., of Caxton House, Westminster. The general reinforcement throughout consists of Kahn trussed bars. From the plan it will be seen that tunnel trucks run under the coal bins, which are buttressed internally. The walls may be considered as self-sustaining, the weight of the coal keeping them in position. The weight is transmitted down the sloping floor and underneath is filled in with chalk (as shown) to add to the stability.

PORTLAND CEMENT WORKS AT GRAVESEND.

FERRO-CONCRETE CONSTRUCTION.*

By Henry Adams, M.Inst.C.E.

So much has been written during the last four or five years upon the use of concrete and steel in combination that there is practically nothing new to be said. Those who have studied the literature of the subject will probably have been struck with the number of different terms used to express this mode of construction. "Béton armé," and the English equivalent, "armoured concrete," are perhaps the least appropriate. "Reinforced concrete" gives undue prominence to one element to the total exclusion of the other; "concrete-steel" is less open to objection, but the writer prefers the term "ferro-concrete" as being self-explanatory of the intimate combination between the two materials, the more important one coming first. A superficial criticism might allege that *ferrum* is iron, and therefore not applicable to steel, but steel is generically iron, and the term is therefore quite appropriate.

In early designs no provision whatever was made to resist the shearing stresses, which were either overlooked or ignored, and it is interesting to observe the gradual recognition these stresses obtained in the hands of the designers, until in recent construction they receive nearly as much consideration as what are called the "direct" stresses of tension and compression. The importance of considering shear was brought prominently under notice by the failure of experimental beams which had no special provision for meeting the shear stress towards the ends, where, of course, it is greatest. Various methods are employed in the different systems, but the Kahn trussed bar seems peculiarly suitable, the fin on either side of the core being left attached throughout the middle portion where the tension is greatest, and separated and bent upwards towards the ends to take the shear where the tension is least.

The question of adhesion between the concrete and the steel at one time caused some anxiety. It was naturally supposed that with increase of temperature the steel would expand more than the concrete, and it was thought that this would be sufficient to impair, if not to destroy, any adhesion that might be otherwise obtainable. As a matter of fact the linear change for a given variation of temperature is about 15 per cent. less for concrete than for steel, but when the actual figures are compared the difference is very trifling. Taking the range of temperature between summer and winter as seventy degrees Fahrenheit, the change of length in 100ft. produced by this variation of temperature will be for steel 0·546in. and for concrete 0·464in. the difference between the two materials in a length of one foot being less than a thousandth of an inch.

With equal care in mixing the concrete the adhesion varies with the condition of the surface of the steel. When coated with red oxide paint it is extremely slight, and even a bituminous paint reduces the adhesion below that due to a clean unprepared surface. It is, however, found that the best adhesion occurs when the steel is rusted all over before being embedded in the concrete. This appears to be due to the formation of some chemical compound, or salt of iron and lime, which may not be detrimental in the absence of further moisture, but the final result is doubtful in such cases as reservoir walls, tanks, and dams. Painting the steelwork over with cement wash is a simple method of commencing the contact, and this would seem to prevent further rusting, on the principle of the pail of limewater into which the Sheffield grinders dip their small goods to resist the tendency to rust when left wet.

Professor Bauschinger found the ultimate adhesion to be from 569 to 668lb. per sq. in., but Mr. J. S. Costigan found it not to exceed 65lb. per sq. in. Probably in the former case it was measured by the resistance of a rod to withdrawal, and in the latter by the insertion of small plates in a briquette. At any rate it is not safe to reckon upon more than 50lb. per sq. in. as a working load for adhesion. Allowing 16,000lb. per sq. in. as the working load on steel, the embedded length that would make the strength and adhesion equal would be 16,000 times the sectional area of steel in square inches divided by fifty times the surface area per inch in length, or briefly $320\ a \div s$; so that a quarter-inch square bar embedded for a length of twenty inches would be equally strong against tearing or slipping, and similarly a one-inch square bar would need to be embedded for a length of eighty inches. There are many different constructions in which this fact may be of importance; for instance, in a simple beam, if the span is less than twice the above lengths, there will be a tendency for the rod to draw before the tensile strength is utilised, unless the ends are turned up to form cleats. In the edge of a circular ferro-concrete tank, instead of overlapping the ends of the rods, for which the above distance would be a minimum, it would clearly be more economical to turn up the ends and slip a welded link over them. There are several specially prepared bars giving greater resistance to withdrawal—*e.g.*, the Ransome twisted bar, the square corrugated bar, and the Columbian bar, which relies for efficiency upon its large surface area compared with its sectional area, but plain rods which can be obtained everywhere should be adopted whenever possible, on the score of economy and avoidance of delay.

Ferro-concrete does not at first sight lend itself readily to architectural effect; the warehouses and coal stores constructed of it can hardly be called visions of beauty, but some of the recent arched bridges have a decidedly pleasing effect, and when the adaptability of the compound material becomes better known we may confidently look forward to the expression of taste as well as utility in the designs.

Perhaps the greatest departure from existing models occurs in the construction of ferro-concrete retaining walls. Hitherto we have looked upon weight as the essential element of such walls, and stability has been secured by leaning this weight against the bank of earth to be supported. We are now confronted with a new type in which added weight bears no part; the only weight employed is that of the earth itself. The construction consists of a skin of concrete reinforced with steel rods, securely and continuously attached to a similar base and forming with it two sides of a triangle. The face wall is then kept in position by rods protected by concrete, tying the inner edge of the base at intervals to the face at one or more points of the height. It does not follow that because the centre of effort of the thrust occurs at one-third of the height that that is the proper place for the connection to be made; it would be if the wall were disconnected at the bottom, but being firmly secured there the point of attachment should certainly be higher than one-third. If the stiffness throughout the height be uniform the point of attachment should be about 58 per cent. of the height. There are some other rather nice points of calculation about these walls which the writer does not propose to go into now; he would only point out that, apart from strength, the stability is obtained by the weight of earth resting on the base. Other examples of these walls have reinforced counterforts six to nine inches thick extending to the whole height at intervals of eight to ten feet, in the length, and others again have reinforced buttresses at similar intervals, and in one case the writer has seen the base of the wall extended in the front instead of at the back, so as to react by pressure at a considerable leverage, but this method does not appear to be so economical as that previously described.

There are, no doubt, many other uses to which ferro-concrete systems may be applied. Englishmen are naturally conservative; they like to feel that in their adoption of any new system they are not running too great a risk, and a novel form of construction such as this must undoubtedly have some failures, but, paraphrasing the old saying, the writer would urge that "nothing succeeds like failure." It is from failures that the greatest knowledge of true principles can be obtained, and therefore we should be grateful to those pioneers who do venture to take risk, even at the sacrifice of some reputation.

REINFORCED CONCRETE.*

Its Relation to Fire Protection.

By E. P. Goodrich, M.Am.Soc.C.E.

In choosing the subject of "Reinforced Concrete and its Relation to Fire Protection," the writer had in mind the dual conditions necessary to the greatest immunity from fire in large building constructions, particularly where such has varied types of occupancy, together with correspondingly different manufacturing fire hazards.

The requisites are, first, the employment of the most incombustible materials and the assembling of these elements in such manner as will most effectively limit the spread of fire; secondly, the equipment of the building with such protective and extinguishing apparatus as a wide experience has determined most effective. Either of these essentials alone will accomplish a large measure of results, but to secure a maximum the combination is necessary.

An exemplification of such a combination is the tenant factory community being developed by the Bush Terminal Company of Brooklyn, N.Y., U.S.A., for which reinforced concrete has been adopted as the structural part of all buildings. These factories were especially designed to take advantage of all insurance regulations, and thus secure the minimum insurance rates on buildings and contents.

Associations of insurance companies in the United States have had the effect of standardising requirements. All the most important points thus developed were carefully considered in the design of the Bush Factories, which thus were provided with:

---

* Summary of papers read before the Seventh International Congress of Architects on July 17.

Special fire walls.
Special stair and elevator shafts.
Waterproof floors.
Automatic fire doors.
A complete sprinkler equipment.
Windows of wire glass in metal frames.

The reinforced concrete design was prepared with special care as to the fire-resisting qualities of the structure. A "unit" system of reinforcement was devised, which proved effective and economical, not liable to derangement during construction, and especially advantageous because allowing of the use of special fire-resisting materials at points of greatest danger. The columns, even though built of concrete, were fire-proofed with cinder concrete shells, which served at the same time as a vehicle for the steel reinforcement and as a mould for the construction of the main body of the column.

The building now completed enjoys the lowest rate of fire insurance, both as to structure and contents, accorded any similar risk.

CONSTRUCTION AND ÆSTHETICS.

By Professor Louis Clouquet.

[On behalf of the Central Society of Architecture of Belgium.]

Constructive Point of View.

This old style edifice was characterised by the separation between two distinct parts, the walls and the gable. There is a lack of solidarity between the two. At the point where the trusses of the frame rest upon the walls there is something like an articulation. The introduction of the metallic frames has not at once remedied this characteristic defect of buildings formed of stone walls and gables of wood. For a long time it was customary to combine trusses of iron similar to the wooden trusses. The solution of the problem of the large halls only made a decisive step in advance when the centred trusses were introduced, which have their starting point on the ground, like the trusses of the Dion pattern. From that moment the solidity between the vertical and the inclined parts was secured. However, it is only the trusses which cannot be deformed. The solidity between the vertical and the inclined parts is not realised in the enclosing surfaces. There is lack of homogeneity between the two parts of the building—that is to say, its skeleton or frame and its wall. Logic claims a more radical solution, which would consist in establishing solidity not only between the uprights and the trusses, but rather between the wall and the roof. This is what the use of reinforced concrete enables us to realise. The side wall may even disappear or be made one with a vault. The whole will show almost uninterrupted surfaces on the outside as well as on the inside, with the absence of the encumbering internal protrudings of the frames. The new arrangement has, therefore, as a result to save the trusses, and only to maintain a surrounding wall which supports itself without any assistance. Now, experience has shown that buildings conceived on this plan do not cost more than those carried out in thick stone walls with metallic gables, and that they are solid.

If it is the question of a building with storeys the floor of reinforced concrete takes with advantage the place of the old systems. The most characteristic consequence of the use of reinforced concrete is the supression of the roof, as the uppermost ceiling can be used as a cover and constitute an inhabitable terrace. This kind of construction lends itself, moreover, to the boldest rakes or overhanging structures.

This system, if applied in a rational manner, is able to bring a change into the architectural forms. It simplifies the forms, it causes the cumbersome complexities of the frames and floorings to disappear, it simply carries out all the surrounding or separating surfaces. It makes disappear every distinction between the wall and the roof. It introduces an architecture consisting of such elastic surrounding walls that these can be given any dimensions required, according to the space it is useful to enclose. The compartments will take the shapes of parallelopipeds terminated by terraces, and the large buildings with curved vaults with visible estrades. We must be prepared to see sculptures and moulded relief work disappear and coloured ornaments prevail. A radical change in the internal and external forms of the buildings will be the consequence of the substitution of a concrete solid, homogeneous structure for our former architectonic organism. All the forms proper for a combination of marked out stones and covered over with plaster, which will henceforth no longer be used, would here be devoid of expression and æsthetic value. They must be given up and other methods must be found.

The Æsthetic Point of View.

We have in mind three kinds of form: those of *convenience*, those of *structure*, and those of *expression*.

The forms of convenience, by which the building receives its complete usefulness and a character in harmony with its destination, satisfies the mind without causing pleasure to the eye. Those forms of convenience which are, if not the most pleasing, at least the most excellent can be carried out to perfection by making use of the processes, so eminently practical, of reinforced concrete.

The forms of expression are those by which the architect and his assistants put their imagination and their soul into the building, in order to impart to it the eloquence of a pleasant aspect. The ideal is that they shall form an integral and inseparable part of the structures. In the buildings constructed of reinforced concrete there is little scope for the artist's talent, especially the sculptor's. There remains hardly anything except the superficial decoration by painting and some polychromic, ceramic, or other adornments, but for the artists in colour a vast field is opened for their creations.

The forms of structure, either real or fictitious, are the principal ornament of the buildings produced by the old methods. They are those organic forms which give life to the aspect of buildings with walls of marked out stones.

In the old-fashioned conception a building is to be compared with a living organism where we can distinguish a skeleton, various members, and a sort of muscular system. Reinforced concrete does not afford these elements of interest and charm; it leaves the impression that the work has been carried out in too docile a material, on which the sacred labour of the workman and his traditional processes have not left the traces of the noble struggle between the artisan and matter. We do not find the same beauty in this work all cast in one block in a dead and dull-coloured material, without apparatus, without organism, with which the best thing that can be done is to hide them beneath a superficial decoration.

In conclusion the new processes, economic and powerful as they are, are precious from the point of view of certain bold and complex accomplishments. They are devoid of the charm of an artistic expression. Besides, economy is only a relative law and of a secondary character, and the boldness of the structure is not always required. A process which is prevalent from these two points of view does not impose itself to the exclusion of the others. Recourse may be had to it for the economic satisfaction of ultilitarian projects, for the realisation of comfort, and for the solution of bold problems. But it will eliminate from architectural practice the noble and artistic combinations of masonry work in marked-out stones, moulded and sculptured, of frameworks in wood and in metal, of superstructures with vaults, &c.

STEEL AND REINFORCED CONCRETE CONSTRUCTION.*

By Joaquin Bassegoda (Barcelona).

Building in reinforced concrete does not solve any new problem either in art or construction; it is a composite building of stone and metallic materials by means of which, profiting by the qualities of the two components, difficulties are more economically solved than could be done with either of them alone.

Economy in the use of reinforced concrete does not depend on the low price of the materials of which it is composed, which are comparatively dear, but on their accurate combination, which allows of the quantity being reduced. Economy consequently has a limit in the maximum co-efficient of ironwork and concrete.

There is no reason why these co-efficients, especially that of the concrete, should be higher than homogeneous constructions, for there are many circumstances, all difficult to foresee, which may produce lower resistances than those which have served as a basis in the calculation; such as the quality of the cement; the nature and size of the sand and gravel, and the manipulation and use of the different materials.

This consideration has produced various systems from which cement work has been almost completely eliminated, or in which at all events, it has not been taken into consideration in the calculation; it is then considered as a simple exterior covering destined to protect the metal against agents which would tend to destroy it, such as oxidation and fire.

Security reaches its maximum in these systems, but, on the other hand, economy diminishes; it may happen that this kind of masonry may become less economical than other homogeneous kinds, such, for example, as brick laid with cement.

In countries where they have excellent bricks which, according to an already old-established custom, they use in very reduced thicknesses, either in the parts which give support or in the parts which are supported (arches and horizontal floorings), one might introduce the system of fortifying these constructions, thus obtaining a greater ecomomy in homogeneous masonry work and in fortified concrete work.

---

*. Summary of a paper read before the Seventh International Congress of Architects on July 17th.

In places where construction in brick does not meet the conditions required, the use of armoured cement offers a real and effective economy over all other systems of construction; an economy which should not be exaggerated whilst admitting coefficients of work very superior to those which experience found to be absolutely safe. One can recommend such systems in which the ironwork is adjusted to be able to resist all external force.

With regard to the artistic point of view of the question, reinforced concrete has no exclusive form; on the contrary, like every concretion, it takes that which is given to it. The supporting element, covering an empty space, may be straight (beam) or curved (arch): the length of the former is comparatively restricted; the length of the latter can be much extended, as is also the case in homogeneous constructions.

In the straight form, as in the curved, the theoretical limit of reinforced concrete requires, on account of the weight of the concrete itself, the use of a greater volume of iron in the ironwork than is required in homogeneous metallic constructions. The relation or proportion between the units of resistance and of weight is 13 times greater in cement than in iron. It follows that in proportion as the absolute dimensions of the works in reinforced concrete are increased, so must the importance of the iron over the cement be increased also, and in consequence the forms then have the characteristics of metallic constructions, as may be noticed in the large bridges.

On the other hand, in architectonic works, in which it is scarcely ever desired to attain the maximum of possible dimensions, the artistic character must come from the lines, projections, and coloration. With regard to the first, the architect can choose freely without any restriction; the second, whatever they may be—mouldings, ornamental decorations, &c.—can also be obtained with ease and comparative economy, but with the drawback that for their execution one must have recourse to moulding, which indicates a limitation of artistic effect to which architectonic art cannot bring itself. With regard to colour one cannot admit the only one, that of cement; but, on the contrary, this modern concrete must be treated as the ancients treated it—that is to say, by covering it either altogether or in part with other materials of which the varied coloration permits of obtaining the desired effect being obtained, as certain architects and engineers are already doing who have succeeded in using armoured cement in their works with a particularly artistic effect.

SHEAR STRESSES.

In Beams of Steel and of Reinforced Concrete.

By Prof. Robert H. Smith, A.M.I.C.E., M.I.M.E., M.I.E.E., &c.

(Continued from p. 27, No. 593.)

Approximate Solution.

As the phenomenon of the variation of shear stress in the neighbourhood of the junction between the two materials is somewhat complex, it will be illustrated by a simple case—namely, that of there being no steel in the upper part of the section above the neutral axis, and of the steel being confined to one horizontal row of bars embedded near the under surface of the beam.

In this case the distribution of stress over the whole upper part above the neutral axis is exactly similar to that in a plain homogeneous beam. Thus, if the section be full and rectangular, T and τ are simply proportioned to the height above neutral axis, and the curve of intensity of shear stress on the vertical section is a parabola rising from zero at the top surface and with its vertex at the neutral axis. The neutral axis, of course, lies low below the mid-depth of the section. Thus, with a rectangular outline to the section of total depth H, and a steel section of, say, $2\frac{1}{2}$ per cent. of the concrete section placed at $\frac{H}{10}$ from the bottom, and with steel elastic modulus 16 times that of the concrete ($e=16$), since $16\times{\cdot}025={\cdot}4$; the neutral axis lies above the under surface a distance $\frac{H}{2}\cdot\frac{1+16\times{\cdot}025\times2\times{\cdot}1}{1+16\times{\cdot}025}=\frac{H}{2}\cdot\frac{1{\cdot}08}{1{\cdot}4}={\cdot}39H$. If e were 20, this height would be $\frac{H}{2}\cdot\frac{1{\cdot}1}{1{\cdot}5}={\cdot}37H$. This proportionate height does not vary largely in practice so long as the steel is placed all near the bottom. As a further example, take the steel 3 per cent. of the whole rectangular section with its lower edge 4 per cent. of H from the bottom surface and $e = 20$. Then the neutral axis lies ·345H from the bottom and ·655 from the top. The moment of inertia of the section is then made up of the following four items, the section width being called B:—

All concrete above neutral axis	$\frac{{\cdot}655^3}{3}$	$= {\cdot}0937BH^3$.
All concrete below neutral axis and above steel	$\frac{{\cdot}275^3}{3}$	$= {\cdot}0069$,,
Steel - -	$20\times{\cdot}03\times{\cdot}29^2$	$= {\cdot}0504$,,
Concrete below steel	${\cdot}04\times{\cdot}325^2$	$= {\cdot}0042$,,
Total - -		$I = {\cdot}1552BH^3$.

A plain homogeneous rectangular section would have $I=\frac{1}{12}BH^3={\cdot}0833BH^3$.

The bending modulus for the extreme compressive stress in the concrete is $\frac{{\cdot}1552}{{\cdot}655}={\cdot}237BH^2$. That for the tensive stress in the concrete at the same level as the steel is $\frac{{\cdot}1552}{{\cdot}29}={\cdot}533BH^2$. That for the tensive stress in the steel is $\frac{{\cdot}533}{20}={\cdot}02665BH^2$. This tensive stress in the concrete is less than the extreme compressive stress in the ratio $\frac{29}{{\cdot}655}={\cdot}443$; and, therefore, the tensive stress in the steel is greater than the extreme compressive stress in the ratio $20\times{\cdot}443=8{\cdot}86$. If this extreme compressive stress be 600 lbs./in.², then the bending moment is

$$600\times{\cdot}237=142BH^2 \text{ inch-lbs.}$$

with B and H in inches.

The total compressive force upon the section above the neutral axis is $\frac{1}{2}\times600\times{\cdot}655BH$, or in general terms $\frac{T_m}{2}\times{\cdot}655BH$, if T_m be the extreme fibre compression, and $u\frac{I}{H}={\cdot}237BH^2$. Now, if F be the total shear force over the whole section it has been shown that the difference of T_m in two contiguous sections b apart is $T_m'b=\frac{Fb}{{\cdot}237BH^2}$. Therefore the difference of the two total compressive forces above the neutral axis on these two sections is $\frac{Fb\times{\cdot}655BH}{2\times{\cdot}237BH^2}=\frac{{\cdot}655}{2\times{\cdot}237}\frac{Fb}{H}$. This causes shear on the neutral axis surface $b\times B$, and the intensity of this shear is $\frac{{\cdot}655}{2\times{\cdot}237}\frac{F}{BH}=1{\cdot}38\frac{F}{BH}=1{\cdot}38\bar{S}$, if $\bar{S}$ be the average shear stress over the whole section. If the depth of the neutral axis below the upper surface be called $cH={\cdot}655H$ in this special case, then the factor $1{\cdot}38$ is $\frac{c^2}{2i}$, where i is the coefficient in $I=iBH^3$. For a full homogeneous rectangular section, the ratio of maximum shear stress at neutral axis to average shear stress is well known to be $1\frac{1}{2}$: here $c=\frac{1}{2}$ and $i=\frac{1}{12}$, and $\frac{12}{2\times4}=1\frac{1}{2}$. For the reinforced concrete beam here taken as an example, it is reduced from $1\frac{1}{2}$ to $1\frac{3}{8}$.

For any other sectional shape than the rectangular, all we have to do is to compute $T_m'b=\frac{cFb}{iBH^2}$; from this find the difference of the two total thrusts above neutral axis, and divide by bB_n, where B_n is the breadth of the section at the neutral axis. The small distance b of the sections apart, of course, cancels in the division and there, remains as the shear stress at neutral axis a definite numerical factor (depending on the sectional shape) multiplied by $\frac{F}{B_n H}$. The ratio of $B_n H$ to the whole sectional area being known, this gives the ratio of this neutral axis shear to the average shear over the total section.

Proceeding now downwards to a horizontal section j, the steel, say at $\frac{{\cdot}655}{2}H$, below neutral axis in the example here taken, here the tensive stress is half the compressive stress at the upper surface, and the total pull between this level and the neutral axis is $\frac{1}{4}$ of the total thrust above this axis. This applies to both vertical sections b apart, and on each above the section considered up to the top there is an excess of thrust over pull equal to $\frac{3}{4}$ the total thrust. The same proportion applies to the difference of this excess on the two vertical sections, and (the section being of uniform width) the shear stress on horizontal and vertical sections at this level is $\frac{3}{4}$ of its intensity at the neutral axis. Down to the close neighbourhood of the steel it decreases from its maximum intensity at neutral axis according to the same law that would hold for a rectangular homogeneous section of depth $2\times{\cdot}655H=1{\cdot}31H$.

At the level of the steel, since the steel is stretched horizontally in the same ratio as the concrete at the same level, and is therefore stressed e times as much as the concrete, the rate of variation per inch horizontal of the steel-stress is e times that of the concrete. That is, T''_h is e times greater in steel than in contiguous concrete at same level. But we found that the variation of shear per inch vertical $S''_v = T''_h$ in each material; so that apparently the shear in the steel must vary vertically twenty times more rapidly than it does in the concrete. Thus if S be the shear stress in the concrete immediately above the steel and in contact with it, and if there were the same shear in the steel at this level, and if S_2 were the shear in the concrete immediately below and in contact with the steel, the variation in the concrete being (S_1-S_2), that in the steel would be $20\ (S_1-S_2)$, and the shear in the lower side of the steel would be $S_1 - 20\ (S_1 - S_2) = (20S_2 - 19S_1)$, and this would be less than that in the contiguous concrete by a difference of $S_2 - (20S_2 - 19S_1) = 19\ (S_1 - S_2)$. Is such a difference possible? Although discontinuity of shear strain is possible, and indeed inevitable, at the dividing surfaces between the materials, as also discontinuity of rates of variation of stress, there is no physical possibility of discontinuity of the shear stress itself. Even if there were shear fracture at these surfaces, and the one material actually slid over the other, the shear at each of the two touching surfaces would be the friction resisting such sliding, and would therefore be equal on each.

A part answer to this paradox is that in Fig. 2 there were considered the stresses on only two of the three sets of parallel sides of the prism $a \times b \times 1$. In most elastic problems the stresses on the planes parallel to the main forces are either zero because of symmetry of condition or are too small to need to be taken account of. In most beams the shear stresses on the longitudinal vertical sections are either zero or negligibly minute. Here evidently is a case in which they cannot be neglected; the concrete lying between the steel rods and at the same level clearly drag upon the steel; that is, there are shear forces between steel and concrete on their longitudinal vertical sides as well as at top and bottom, and these shear stresses may vary across the horizontal transverse line. If S^1_h represent the variation per inch horizontal transversely of the horizontal shear upon longitudinal vertical sections, then the complete equation of variation is

$$S''_v + S''_h = T''_h.$$

This law is well-known in elastic theory, and it need not be proved here.

Mutual Shear Drag of Concrete and Steel.

Simply because the steel and concrete are jointed together so as to be compelled to stretch equally along longitudinal lines, and therefore be subjected to unequal stresses, it is clear that the concrete exerts on the steel all round its periphery a special shear drag to prevent the steel stretching so much as it would do if it were not attached to the concrete, while the steel exerts on the concrete surrounding it a reciprocal shear drag stretching it more than it would do if the connection were fractured. This interaction between the two is analogous to that called "self-strain," although here it arises because of, and in proportion to, the externally applied loads. It produces special curvature of the transverse sections in the concrete in the regions immediately outside the periphery of each steel bar, and also special reverse curvature in the transverse sections of the steel immediately inside these peripheries. These spherical curvatures are

Dimples

in the regular lay of the total transverse section of the beam—dimples such as were referred to early in this paper. They produce special inequality of the distribution of horizontal extension both in the concrete and in the steel in the close neighbourhood of their dividing surfaces. This special inequality of distribution is such as to make the extension of the concrete close to the steel greater, and consequently also its tensive stress greater, than the average or normal in the concrete at the same level across the section; and such as to make the extension of the steel immediately inside its periphery less, and the tensive stress in the steel proportionately less than the average in the steel at the same level—still less than the maximum at the mid-width of the steel section. This rounding off of tension strain and stress in both concrete and steel near their dividing edges approximates the stresses in the two at these separating surfaces to such a degree that, although the concrete and steel stresses themselves are by no means equal, still they are able to obey the law

$$S'_v + S''_h = T''_h$$

on each side of the division. In fact, obedience to this law is the limiting factor which determines the amount of the rounding off in each material. It will be readily understood that the special rounding across these divisions greatly increases the local shears in both materials above the average shear across the whole width of the beam section at each such level. To calculate the exact amount of this local excess shear is too complex and difficult a problem to attempt within the scope of this article, and requires the application of other fundamental elastic laws that have not been referred to here. Sufficient to say that the excess shear stress is proportional to the difference of the elastic moduli of the two materials, and that it is greatly diminished by shouldering and collaring such as is employed in Thacher bars, provided the shoulders have no sharp corners. These shoulders transmit the integral shear forces, or a large part of them, from material to material by thrust in substitute for shear stress on longitudinal dividing surfaces. With plain reinforcing rods or wires, the local excess shear probably extends in the steel inwards from the steel periphery not more than $\frac{1}{100}$in. and outwards in the concrete from the same periphery not more than about $\frac{1}{10}$th or $\frac{1}{8}$th of an inch.

Another Effect of these Dimples

is practically important. It is that they make slightly untrue the statement that the stretch of steel and concrete is the same at the same level in the section. They are actually the same only at the precise peripheral contact surfaces between them. The stretch here is greater than the average stretch in the concrete and less than the average in the steel. This latter is therefore greater than the average in the concrete. The maximum in the steel is still greater than the average in the concrete, and this applies, of course, equally to the stresses as well as to the strains. The pull of the rods is therefore somewhat greater than *e* times that of an equal concrete sectional area at the same level. The excess, however, cannot in well-designed practical work be large; and its exact calculation is not only difficult but also impossible without account being taken of the special connections, if any, of the ends of the steel rods to the supports, or of the special mode of anchoring these ends in the concrete.

As for the *average* shear stresses over the whole width of the section at those levels where both steel and concrete appear, these can be calculated on the approximate assumption that the tensions are accurately known, precisely in the same manner as has been illustrated above for the all-concrete levels. All the thrusts and tensions above the level investigated are to be reckoned for each of two contiguous cross-sections a small distance *b* apart; the difference of the two sums (reckoned algebraically giving + and — signs to the thrusts and pulls) is to be divided by B*b*, where B is the horizontal width of the steel-concrete transverse level line. The quotient gives $\overline{S}$, the average across the width B of the shear stress. Neglecting the feeble vertical compressive stresses on the horizontal planes, the maximum shear stresses may then be reckoned from

$$S_m = \pm \tfrac{1}{2}\sqrt{T^2 + 4S^2}$$

these being on planes at $\tan 2\,(\text{-}) = \frac{T}{2S}$ from the horizontal. These are greater in the steel than in the concrete because of T being greater. But it must be remembered that this calculation leaves out of account the excess shear stress due to the dimpling explained above.

(*To be continued.*)

REINFORCED CONCRETE SYSTEMS.

III.—Expanded Metal.

Expanded metal has been very extensively adopted of recent years for all kinds of reinforced concrete work in this country and abroad. It is now about 15 years since its advantages for reinforcing concrete were first practically recognised. It may thus be looked upon as one of the earliest systems of reinforced concrete in general adoption, and we, therefore, shall deal with the various uses of expanded metal for the strengthening of concrete in the third article of this series.

The basic patent for the manufacture of expanded metal was obtained in 1884 by Mr. John F. Golding, a native of the States. It is thus an American invention, and it was very shortly afterwards pushed extensively in this country as well as in the United States. At first the machinery was only capable of dealing with metal sheets of slight thickness, and it was therefore used as metal lathing for plastering. After some years' experience, however, the manufacture was improved and sheets of greater thickness were dealt with. These were suitable for reinforcing floors of small span and light loads, and for strengthening paving slabs and walls. As time went on the machinery was improved until it became possible to shear metal of considerable thickness, sufficient for all practical purposes.

One of the earliest buildings where expanded metal was used for reinforcing purposes was the General Post Office, St. Martin's-le-Grand, erected about 15 years ago. Here concrete floors and partitions had expanded metal placed therein to strengthen them.

The Manufacture.

In our issue for April 26, 1905, we illus-

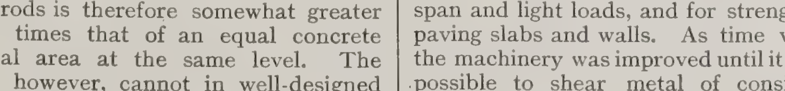

FIG. 1.

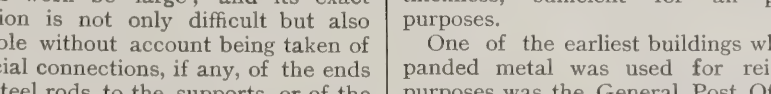

FIG. 2.

trated the present machine for manufacturing expanded metal. This will produce sheets up to 16ft. wide, the long way of the mesh.

The expansion of the steel sheets in process of manufacture is from two to twelve times the original width of the sheets according to the sizes of the meshes and the width of the strands formed. Owing to the stretching of the strands in the process of manufacture the expansion causes no diminution in weight and no reduction in the original lengths of the sheets. The sheets used range from 24-B.W.G. to ¼-inch plate.

When expanded metal was first used for the purpose of reinforcing concrete it was naturally first adopted for slabs, for which it was obviously suitable, and we may therefore deal with its use in this way before passing to the many other ways in which the material is now used.

The various expanded metal companies in America and England early made experiments to determine the degree to which expanded steel strengthened slabs of concrete in which it was placed, the economy in the amount of concrete effected by its use, and in order to discover a basis upon which to design work with such a reinforcement.

FIG. 6.—THE CHANNEL ARCH FLOOR.

The experiment made by Mr. D. A. Low, in June, 1899, at the East London Technical College, elicited the fact that that expanded steel sheets possessed an average breaking strength of 31 tons per sq. in.

Experiments also made by Messrs. David Kircaldy & Son about the same time, showed that, whereas the average strength of the sheets before being sheared and expanded was 27 tons per sq. in., after [illegible] ment their strength became 32 tons per sq. in.

Tests on Slabs.

Messrs. Fowler & Baker, in April, 1896, carried out some tests upon the strength of slabs reinforced with expanded metal and uniformly loaded. The composition of the concrete used in these tests was 1 of cement, 1 of Leighton Buzzard sand, and 2 of Thames ballast. The expanded metal was of 3-in. mesh reckoned across the short way of the diamond.

The following table gives the average results of the tests on slabs 3ins. thick and 2ft. wide :—

Clear Span.	Thickness of Ex. Metal.	Breaking Strength. (cwts.)
3ft. 6in.	$\frac{7}{32}$in. by $\frac{3}{32}$in.	15·86
3ft. 6in.	$\frac{7}{32}$in. by $\frac{5}{32}$in.	19·28
6ft. 6in.	$\frac{7}{32}$in. by $\frac{3}{32}$in.	4·61
6ft. 6in.	$\frac{7}{32}$in. by $\frac{5}{32}$in.	5·07

A series of experiments was also carried out in 1899 at Newcastle before a joint committee of representatives of the Northern Architectural Association, Newcastle, Gateshead and Tyne District Master-Builders' Association and the Council of the Building Trades Exchange, upon which we reported at the time. The concrete of these slabs was composed of 4 parts clean washed gravel, 1 part clean sand, and 1 part Portland cement in the case of the 5-in. slabs; and of 2 parts gravel, 1 part sand and 1 part Portland cement in the case of the 3--in. slabs. It was

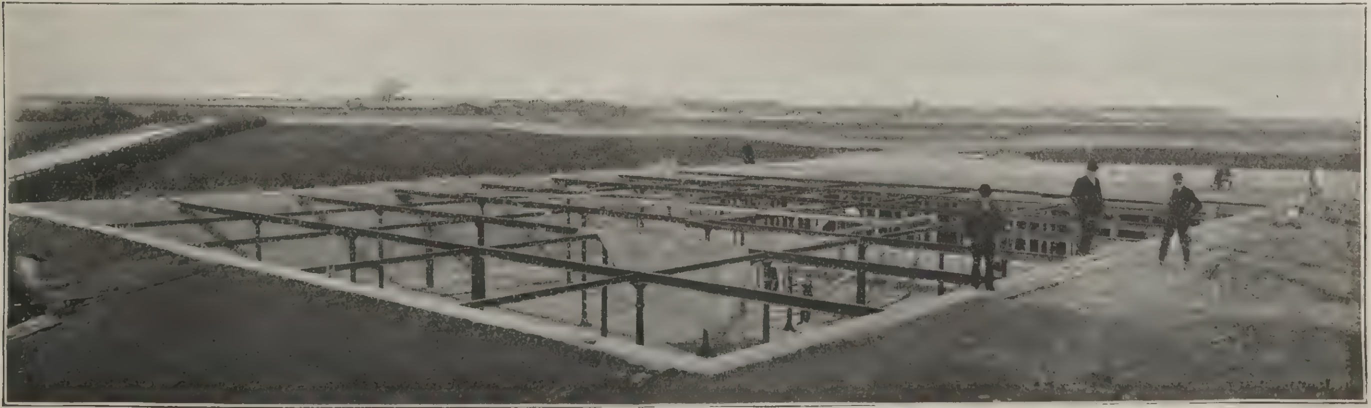

FIG. 10.—SCUNTHORPE WATERWORKS, NEAR DONCASTER.

thus respectively, five and three to one. Each slab was 4ft. wide and the expanded metal 3-in. mesh. The results of these tests are given in the following table :—

Size of Slab.	Clear Span.	Thickness of Slab.	Thickness of Ex. Metal.	Breaking Strength (lbs.)
8ft. × 4ft.	7ft.	5in.	$\frac{1}{4}$in. × $\frac{3}{16}$in.	26,642
8ft. × 4ft.	7ft.	3in.	$\frac{1}{4}$in. × $\frac{1}{2}$in.	10,797
6ft. 6in. × 4ft.	5ft. 6in.	5in.	$\frac{1}{4}$in. × $\frac{3}{16}$in.	38,129*
6ft. 6in. × 4ft.	5ft. 6in.	3in.	$\frac{1}{4}$in. × $\frac{1}{8}$in.	12,678
5ft. × 4ft.	4ft.	3in.	$\frac{1}{4}$in. × $\frac{1}{8}$in.	23,957
5ft. × 4ft.	4ft.	5in.	$\frac{1}{4}$in. × $\frac{3}{16}$in.	30,308*

* Unbroken at this load.

In 1903 a test was carried out by Messrs. A. T. Walmsley, J. P. Allen, and A. Home Morton on a slab of much greater span than the foregoing. The expanded steel used was No. 10 3-in. mesh, $\frac{1}{4}$in. by $\frac{3}{16}$in. strands. The slab was 7ins. thick and the expanded metal was placed as close to the underside as possible. The concrete was composed of 1 part Portland cement, $2\frac{1}{2}$ parts brick broken to pass a $\frac{3}{4}$-in. sieve, and $1\frac{1}{2}$ sand. The unsupported area of the slab was 15ft. by 15ft. and it had a 6-in. bearing on all four sides. The slab finally gave way under a total load of 56 tons 11 cwt.

Formulæ derived from Experiments.

Many other tests were carried out in America, and from them the engineers of the manufacturing companies were early in possession of facts which enabled them to draw up a rational method of calculation which is practically the same as the generally recognised methods adopted at the present day.

We might refer those interested to a paper read by Mr. Arthur T. Walmsley before the British Association at Bradford in September, 1900, in which the method of calculating the reinforcement of slabs or beams was carefully gone into. This contribution is valuable as showing that, as a result of tests on expanded metal, an independent engineer of eminence had placed before the profession an easy and accurate method of ascertaining the proportion of steel to utilise the strength of concrete to the full.

The various types of floor construction

adopted are shown in Figs. 1-5. Figs. 1 and 2 show the forms best adapted for long or short spans. In Fig. 1, the expanded steel follows the line of tension in the beam, but it is often more practicable to use a layer embedded throughout the under side of the concrete with tension strips over the intermediate bearing at the top of the concrete, *i.e.*, at the point of contraflexure, as shown in Fig. 2. In the system shown in Fig. 3 the concrete is flush with the top of beams, while the bottom flange of the joists is encased with expanded steel lathing, upon which the plaster is applied. In Fig. 4 the floor slab is placed on the top of the joists. Fig. 5 shows a floor with a suspended expanded metal and plaster ceiling, this being done where it is desired to have a flat ceiling.

The Channel Arch Floor.

One of the earliest forms of floor to be adopted with expanded metal was the channel arch floor shown in Fig. 6. In this system the spans have varied between 12ft. and 25ft. The ribs or secondary beams are formed of curved steel channels filled in with concrete to the underside of the decking of the floor, and set at various distances according to the span and load to be carried. In the end bays of such a floor, where the channels come against the walls, straight steel channels are placed in chases in the walls to form the necessary bearing, and tie rods take up the horizontal thrust. The rise of the channels is made 1in. per foot of span, and the size of the channels is calculated from the following formula :—

$$A = \frac{Ldl^2}{8000r}$$

Where A = area of channel required in sq. ins. ; L = total safe load per sq. ft. in lbs. ; d = distance between ribs in ft. ; l = span in ft. ; r = rise of arch channel in ins.

It may be mentioned that the centering for these floors is supported upon the cambered channels by means of bolts passing through the side forms which retain the concrete of the ribs. Among the buildings in which floors were executed upon this channel arch system are : warehouses at the Manchester Ship Canal ; Armstrong, Whitworth & Co.'s Elswick Works ; Granton Gas Works ; breweries at Gateshead-on-Tyne, Stockwell, S.W., Horselydown, S.E., and Guildford.

In the construction of floor slabs it is plain that expanded metal is a most economical form of reinforcement. There is much less labour entailed than with interlacing rods which have to be placed in position and kept in place. The sheets of expanded metal are simply laid upon the centering and the concrete shovelled in upon them. Fig. 7 shows such a floor in course of construction before the concrete is filled upon the expanded metal sheets. This particular floor is at the electric generating station at Chelsea which supplies power for the Underground Railway. The whole of the floors in this building are carried out with expanded metal.

It stands to reason that expanded metal extending across the full width of a floor slab develops the strength of the concrete to the full and has no tendency to pull out such as round rods without rigidly attached shear members have.

Expanded metal has been extended in its use beyond the floor slab of recent years, and is now used for the construction of beams, columns, pillars, piles and other parts of construction.

The use of the metal for the reinforcement of

Beams

is interesting, and has been adopted to some extent in the United States. In this connection it must be explained that in shearing the metal before expanding it, it is possible to leave a solid uncut strip at the end. This strip of metal is made generally of three widths—namely, $2\frac{1}{4}$ins., 3ins. and 4ins. The adjoining sheared metal is pulled out into the well-known diagonal form so as to be of the following lengths : 6ins., 9ins. and 12ins. The expanded mesh work is then turned at right angles to the solid strip so as to stand vertically upwards in the beam like an **L**. The solid metal strip consequently serves as the tension rod in the bottom of a beam, while the vertical mesh work performs an important part—namely, reinforcing the beam against shear stresses, the mesh work crossing the lines of compressive and tensile stresses in a beam at right angles, which lines extend as curves from the top and bottom of the beam respectively.

Columns.

The same form of expanded metal bar is used for the vertical reinforcement in columns or pillars, the solid metal strips being placed at the outside of the column and the mesh-work extended inwards towards the centre. Another form of column reinforcement consists in placing round rods vertically and wrapping round them, at the outside, sheets of expanded metal. This is a form in which

Piles

are made with expanded metal. The sheets strengthen the pillar or pile from splintering outwards under pressure or being damaged by vibration stresses induced by pile driving.

It may here be mentioned that this ability to leave a strip of metal at the edge of the sheet is also found of service in connection with roof work, this strip being bent over angle irons to resist the tendency to sliding.

As regards Wall Construction,

expanded metal is placed either in the centre or on both faces of a wall. Fig. 8 shows an example. The wall seen on the left of the view is a retaining wall for the surrounding earth and has sheets of expanded metal on external and internal faces. The wall shown on the right is an internal wall sustaining the external wall of the building above ground, and has a sheet of expanded metal in the centre. The cross-bracing shown is constructed of joists encased in concrete, while the roof of the dry area is the pavement of the street above. Another example of wall construction is shown in Fig. 9—namely, a boundary wall at Hartlepool, with buttresses and footings reinforced with the same material. The wall was constructed by means of temporary wood centering covered with oiled paper sheeting, the sheeting doing away with the necessity of rendering the concrete in cement after the centering had been struck. Expanded metal has been greatly used in foundation work ; and, in fact, it is impossible to enumerate all the uses to which it has been put, and will probably be put, in the future.

Among the various adaptions of expanded metal we may refer to its extended use for the construction of

Reservoirs and Tanks

for water and sewage. Not only are the walls constructed with expanded metal reinforcements, but the roofs also. Fig. 10, shows an example of a reservoir.

Expanded metal has also been used for

Retaining Walls and Sea-Walls.

An example of the latter at West Hartlepool was illustrated in our issue for March 8th, 1905.

We also illustrated in our issue for September 2, 1905, another instance where expanded metal has been found of great service, namely,

Grain Silos.

Figs. 11 and 12 show the use to which expanded metal has been put in the way of a bridge at Reedsmouth. We have not space to illustrate other interesting bridges that have also been constructed with expanded metal.

In our next "Concrete and Steel" Supplement we shall publish an article in which the use of expanded metal in sewer and water-pipe construction is referred to, and we therefore need not illustrate its use in this respect.

Several Official Fire Tests

have been made upon floors constructed with expanded metal, in which it has been shown how excellent is the resistance offered by such floors. The most recent and the most severe test was dealt with in our issue for June 6th last, and need not here be gone into at length again.

The Congress. THE Congress has come and gone, and we give our readers fifteen columns of it this week: that, however, not as any lengthy report of what has been said, but as a succinct summary of the various papers read and the discussions that followed the reading of them. If any readers find it a hard task to get through these fifteen columns, let them remember that this is a comparatively entertaining account of the proceedings. We fear, indeed, that the gift of elaborating on hackneyed subjects, and speaking volumes of airy nothings is quite an international one, and it is no more inspiring in the French tongue than in English. Let us take note of a few significant facts. At the opening meeting of the Congress the Guildhall was filled with members, and there must have been more than 1,700 persons present; while at the garden fête last Thursday evening it is stated that there were 3,000 persons present. Of course, a good many of these were ladies, but supposing we place the number of architects at 1,000, the fact that there were not more than 50 at any of the sessional meetings is, to say the least, suggestive, and the only inference is that dry talks upon subjects about which so much has been said did not attract members. Moreover, of those attending the meetings a small handful of delegates took the leading part, while the rest looked on with more or less interest. The sectional meeting upon the subject of steel and reinforced concrete construction was a case in point. Some of the papers contributed were undoubtedly useful and instructive, but the majority were by theorists, and those who took part in the discussion may, on the whole, be held to know next to nothing of the subject, having had no practical experience, and, so far as we could judge from the tenour of their remarks, had not even taken the trouble to learn something from the recognised works on reinforced concrete construction. The papers and the discussions and resolutions on architectural copyright and the ownership of drawings were the most productive of good, due to the leadership of those who had made a special study of the subject. But, after all, this meeting was only sparsely attended, although we have no doubt a larger meeting would have taken just the same view, as the subject is one on which the profession feels strongly. The organisation of public international architectural competitions might well have occupied the attention of the Congress to a greater extent than it did. It was distinctly a subject which was within the province of an International Congress of Architects, but only very few members attended the meeting, and consequently the foreign delegates did not learn the strong views English architects take in the matter. The way in which the rights of competitors are regarded abroad by the profession and public is, indeed, in need of much reform. As for such subjects as the execution of Government and municipal architectural works by salaried officials, the education of the public in architecture, the architect's control over the craftsman, Government responsibilities in the conservation of national monuments, the architect's training in the crafts, and the laying-out of open spaces—these were generally of such nebulous character that nothing substantial was likely to come out of them. The subjects are, in fact, worn almost threadbare. In our opinion, much more useful results could be obtained if subjects and resolutions for discussion were set by the Permanent Committee of the International Congress and discussed by the architectural societies of each country, the results of these discussions being sent to the main body and reported on to the Congress when in session. They would thus be much better thrashed out than it is possible at the hands of a few members. The subjects, however, that might gain in the discussion by a large meeting might be grouped together and the papers put in print before the meeting, so that they could be read at leisure. This would save time, and would enable a decision to be come to at one largely attended meeting which might fairly be said to represent the collective opinion of the profession. There should be, too, a recognised quorum for the passing of any resolution: otherwise, as has happened during this last week, opinions set down as nominally representing the "International Congress of Architects," become nothing more nor less than those of a few interested members whose views may or may not be worth having. In conclusion, we would urge the greater importance of considering soberly the logic of individual opinion than the collective opinion as arrived at by such congresses, whose chief function is social. Why, indeed, not admit the fact clearly brought out during the last week—that this Congress is a social event? Why affect so much humbug about general questions of architecture when the majority of members do not attend, but go away sightseeing (as one would expect them to)? Let us take the truth to heart. With the thermometer in the eighties architectural ethics can never stand a chance against outdoor excursions and social meetings.

Two Exhibitions. IN the Victoria and Albert Museum at South Kensington the prize designs submitted in the National Competition are now on view. While in the several classes of applied design some excellent work is shown, and the metal work is especially promising, there is but a poor show of architectural drawings: what the bulk of the designs must have been can only be gauged from the examiners' remark "that many are so inferior and so destitute of any architectural quality that they should not have been submitted." Architectural teaching in the schools up and down the country is clearly very unsatisfactory. As an example of what can be done, however, we have only to turn to the exhibition of students' work done by the architectural class under Professor Beresford Pite, shown in block "C." This is of a high average quality and the work is carried out on a big scale, most interesting being the designs for a Nelson monument in St. Paul's, drawn out one-quarter full size. These are, indeed, very admirable studies.

THE INTERNATIONAL CONGRESS OF ARCHITECTS.

Summaries of Papers Read.

In our issue for last week we reported the opening meetings of the Seventh International Congress of Architects, in London, up to the time of going to press. In the present issue we give summaries of the papers read at the various subsequent meetings, together with the resolutions passed and synopses of the discussions that took place.

STEEL AND REINFORCED CONCRETE CONSTRUCTION.

The papers on this subject read before the meeting of the Congress on Tuesday were given in our issue for last week. The discussion that followed was diffuse, and we do not find space to report it. The following resolutions were passed :—

That it is the sense of this meeting that an enquiry into the cases of failure of reinforced concrete and their causes would be most desirable.

That where reinforced concrete is intended to be fire-resisting the greatest possible care must be taken as to the nature of the aggregate and its size, and also as to the protection of the steel.

A paper by Mr. Peter D. Wight on "The use of burned clay products in the fireproofing of buildings in the United States of America" was read. We hope to give this paper together with illustrations, in our next "Fire Supplement."

OFFICIAL ARCHITECTURE.

Summaries of the papers on "The Execution of Important Government and Municipal Architectural Work by Salaried Officials," read before the meeting of the Congress on Tuesday, were given in our issue for last week.

In the discussion following the reading of the papers Mr. George Oakley Totten, junr. (Washington Architectural Club), gave an account of the methods followed in the United States. There were, he said, three classes of Government buildings, (1) those known as federal, such as naval and military buildings, etc., and all post-office buildings; (2) State buildings, of a similar character to the federal buildings but under the control of the various States; and (3) municipal buildings, under the direction of the municipalities throughout the country. The municipal work was generally carried out by city architects, though, in the case of particularly important buildings, competitions were sometimes held. The same applied to the buildings of the various States, while, as to federal buildings, these were partly under the control of salaried architects, but many of the larger works were given out to practising architects of ability. Washington had no city architect, but there was a Supervising Architect's office, under the Treasury Department, in which between 150 and 250 draughtsmen were employed, the bulk of the work being post-office buildings, custom houses, etc. In respect of these last it was interesting to note that Congress this year had voted 39,000,000 dollars for federal buildings to be carried out through the official bureau. The Tarsney Act of 1893, however, gave the Secretary of the Treasury power to hold competitions for any important federal building, and in this way thirty-two competitions had been held since 1897.

Mr. F. E. P. Edwards, city architect of Bradford, claimed that excellent work was being done by salaried architects throughout the country, and he put it to the meeting that it was perhaps on account of the fear of architects being deprived of work which they considered was their own portion, that all the outcry against official architects was raised. The bottom of the whole evil of incompetent architectural work being done was that too many young men were put into architects' offices who had no talent for the work, but who, nevertheless, at the end of their pupilage, were turned loose to get their living somehow.

Mr. A. B. Plummer, of Newcastle-on-Tyne, urged that it was especially wrong for official architects to be allowed to engage in private practice, competing in that capacity with ordinary private architects, more particularly as the latter had to have their plans passed by the official architect.

Other speakers followed, including Mr. W. E. Riley, superintending architect to the London County Council, who made a strong stand for the rights of salaried architects. In the end the following resolution was passed :—

That in the future, in the interests of the administrations and the public, and in the higher interests of the art of architecture, public bodies, whether governmental, provincial or municipal, should entrust important works of architecture only to qualified professional architects, either by competition or otherwise.

INTERNATIONAL ARCHITECTURAL COMPETITIONS.

On this subject two papers were read before the Congress on Wednesday, one by J. Guadet (professor at the École des Beaux-Arts, Inspecteur-Général des Bâtiments Civils) and another by M. Gaston Trélat, of Paris. M. Guadet expressed the opinion that the cost of the competition should be kept distinct from the cost of the building, and that it was dangerous to promise the execution of the work to the authors of the first-premiated design. The assessing of the competition should be by a jury of architects of every nation, these being in the proportion of one assessor to ten competitors; and every nation represented by fewer than ten competitors, with a minimum of five, should have the right to one assessor. In the case of double competitions, the chosen competitors in the first—the sketch competition—should not be classed, and premiums should be reserved as an extra matter for the final competition. Designs should be exhibited before and after adjudication if necessary. In the case of double competitions, however, it was preferable that the sketches submitted in the first should not be exhibited, but held back for inclusion in the exhibition of the designs submitted in the final competition. M. Guadet read the rules formulated by the Society "Architectura et Amicitia" (Amsterdam) for the organisation of public international competitions. By these it is recommended that such competitions shall be double, preliminary competitions being opened in the various countries, or groups of countries, through the medium of the permanent commissions constituted, and each competitor in the final competiton paid an honorarium. The jury, it is recommended, should consist of half the number less one of the competing members of the country in which the competition takes place. The amount of the premiums should be double what would be paid to an architect entrusted with the design in the ordinary way, and the premium should not be deducted from the successful architect's fee.

A short discussion followed the reading of the papers, and the following resolution was passed :—

That a special committee of seven members be appointed by the Permanent Committee to go into the whole question of competitions and present a report at the next Congress.

OWNERSHIP OF ARCHITECTS' DRAWINGS.

Four papers on the subject of "Architectural Copyright and the Ownership of Drawings" were read and discussed before the Congress at the meetings on Wednesday and Thursday, the authors being Mr. H. Heathcote Statham, Signor D. Pablo Salvat (Spain), M. Gaston Trélat (Paris), and M. Georges Harmand, advocate of the Court of Appeal, Paris.

Mr. Statham, dealing with the question whether the drawings and specification of the architect should be retained by him or handed over to his client, said that in France and Germany no legal question was raised, the architect retaining the drawings as a matter of law, and in England the custom had been almost universally the same. But in the case of *Ebdy v. M'Gowan* (1870) the Court ruled that, the building not having been carried out, the drawings must be handed over to the client on his paying for the time expended on them; and in the case of *Gibbon v. Pease* (1904) the Court ruled that the precedent of *Ebdy v. M'Gowan* covered all cases, whether the building had been carried out or not, and that the client had a right to demand all the drawings, the Court refusing to hear any evidence on the side of the architect, whose drawings and specification could therefore, in England, be legally claimed by the client, although he already had what he really paid for—the building. This was a manifest injustice to the architect. Moreover, the custom of handing over the drawings to the client when the building had been planned, but *not* carried out, was a mistake; as an unscrupulous client had only to say that he had changed his mind in order to get possession of the drawings and use them as he pleased, with no further compensation to the architect. The wording of clause I. of the R.I.B.A. Scale of Charges was most unfortunate, as it appeared to state (though not so intended) that the architect's commission was for producing drawings of a building. The wording of this clause should be amended, and he (Mr. Statham) moved a resolution that the necessary steps should be taken to secure this end and to legalise it.

The trend of the discussion following the reading of the papers was towards treating the matter from an international standpoint so as to give a sign-manual that the architect's drawings were his own property. Various resolutions and amendments were put forward, and eventually the following was carried :—

That this Congress is of opinion that the architect is employed to produce a building, and that all drawings and papers prepared by him to that end are undoubtedly his property.

THE ARCHITECT-CRAFTSMAN.

On Wednesday papers by Mr. Reginald Blomfield, A.R.A., Mr. W. R. Lethaby, M. van Gobbelschroy (Belgium), Professor

Otto Wagner (Austria), M. Gaston Trélat (Paris), and MM. Lesage and Poupinel (Paris) were read on the question of how far the architect should receive the theoretical and practical training of the craftsman. Full abstracts of the papers by Mr. Blomfield and Mr. Lethaby are given on pp. 39 and 40 of this issue.

M. Gobbelschroy urged that it was necessary for the architect to be able to work well himself in order that he might be able to command well, but, while he should have sufficient technical knowledge to understand the details of craftsmanship it was not necessary for him to be an expert craftsman.

Professor Wagner's conclusion was the same.

MM. Lesage and Poupinel treated the subject not so much on its general lines as on the particular methods followed in France. It was pointed out that the French Government had organised workshops and professional schools in which workmen only were trained, but it had not yet created any technical school for the training of masters of work, contractors and architects. The Ecole des Beaux-Arts was not a school of architecture, but a special school of the Fine Arts, in which architecture occupied a place similar to painting and sculpture or engraving. The Beaux-Arts ideal was to train the architect's mind in the direction of art and not to teach him a trade. Students were chosen by competition, and on their merits of intelligence and aptitude. The Beaux-Arts school dominated architecture in France and made its influence felt even in the South of Europe, and especially in America. The examinations and competitions in mathematics and construction imposed on students from the very beginning had no other aim than to eliminate those who were unfit for the study of building science, but for technical knowledge students had to go elsewhere, obtaining their experience more particularly in building yards. This chance way of obtaining practical experience, however, was not satisfactory. The instruction should be given in a methodical way, so that side by side with the Beaux-Arts there should be established schools of applied building, analogous to the schools of artillery, military engineering, &c., in connection with the Ecole Polytechnique.

The following resolution was passed:—

That this Congress considering that the architect, the master of the works, having under his immediate direction workmen and artisans of the most varied bodies of the State, and utilising the services of the most varied industries, has no means of acquiring in each of these trades and in each of these industries the complete knowledge of a specialist, expresses the desire that to architectural students the opportunity should be given to acquire in a general but exact manner the technical parts of the various trades and industries of the building trade without claiming to practise these trades and industries. It also expresses the wish that between the schools international and continuous relations may be established.

THE PLANNING AND LAYING-OUT OF STREETS AND OPEN SPACES.

Six papers on this subject were read before the Congress on Wednesday, the authors being M. Ch. Bulls (on behalf of the Société Centrale d'Architecture de Belgique), M. Eugène Hénard (Paris), Signors Vivó, Ribós and de Quintana (Spain), Dr. J. Stübben (Berlin), M. Gaston Trélat (Paris), and Mr. Raymond Unwin.

M. Bulls said that in laying-out streets there were three hypotheses to be considered: (1) An entirely new town might be founded (as at Zeebrugge, in Belgium); (2) a quarter of an old town might be transformed into a modern quarter; or (3) a new suburb might be added to an old town. Principal arteries should be straight, and secondary streets sinuous, and any "squares" arranged in these streets should be oval, not circular. Crossed-shaped intersections should be avoided and star-shaped "squares" condemned.

M. Hénard described the plans of Berlin, London, Moscow and Paris, and emphasised the usefulness of comparing the lay-out of large towns.

Signors Vivó, Ribós and de Quintana dealt with the planning of streets in respect of latitude, sunlight, &c., and stated that the more populous the city was the greater should be its area of open spaces.

Dr. Stübben, after defining what he thought should be the widths of main thoroughfares and side streets, passed in review the cities of the Greeks, the Romans and the Middle Ages, and then, applying principles to modern-day cities, said that the various parts should be divided up in accordance with the purpose which they were intended to serve—*i.e.*, rows of houses, detached or semi-detached buildings, tenements, shops, manufactories, &c. Dr. Stübben showed a number of lantern slides of Continental "places" in connection with his paper.

Mr. Raymond Unwin pointed to the town developments in Germany, where municipalities had extensive powers, and were in the habit of making plans to regulate the development of their towns. It was necessary, he said, for our municipalities to secure additional powers, and probably the best way to begin would be by forming committees in each town to watch over and criticise town development from the æsthetic point of view.

Mr. Frank Miles Day, president of the American Institute of Architects, exhibited some views of American cities, which were received with much interest.

CONSERVATION OF NATIONAL MONUMENTS.

Six papers on this subject were presented to the Congress meeting on Wednesday evening, the authors being Professor G. Baldwin Brown, M. Besnard (Paris), Professor W. R. Lethaby, Signor Ramoneda (Barcelona), the Tuscan College of Engineers and Architects, and M. Gaston Trélat (Paris).

Professor Baldwin Brown gave a succinct account of the measures actually in force on the Continent for the preservation of national monuments. Almost everywhere abroad, he said, the initiative had been taken by the Government, whereas in Britain private individuals and societies had practically done all the work. The British Ancient Monuments Protection Act of 1882, passed as a Government measure, was really due to private enterprise, though more recently there had been encouraging signs that British Governments were coming to recognise this protection as a suitable matter for State care, and the Ancient Monuments Protection Amendment Act of 1900 represented a distinct advance. On the Continent State commissions had been charged with the upkeep of national monuments, and it was very desirable that similar State action should be taken in this country.

M. Besnard took up the subject from the point of view of restoration, urging that a standard programme should be established making it obligatory to preserve records of any work which was to be restored, these records being on a large scale showing the actual condition of the monument, with casts of the sculpture and most characteristic profiles.

Professor Lethaby also took the question of restoration as his theme. Restorers, he said, acknowledged that harm had been done in the past, and then, with professions of sympathy, they went and did likewise, taking the new word "repair" in place of the old word "restoration," but with similar result. Renewal was going forward at quickened rate all over Europe, and the most ancient and beautiful buildings were those which were passed through the mill of restoration and left desolate. St. Front, Perigueux, excited so much interest that it was made over again. The Dom at Aachen was being covered up with fashionable marbles and mosaics. Murano Cathedral looked as though it had been supplied from a factory. And so with many others. The alternative of this method of dealing with old buildings was persistent care and repair. "If architects must restore, let them do it on paper only, without impairing the evidence of the building itself, evidence which disappears when they actually build their theories, so that we have not even the satisfaction of being able to prove them wrong. We can hardly go to any famous building in Europe without finding extensive works in progress; and, unless there is soon some great change of policy, little will be left that is truly old to hand on to posterity."

The contribution of the Tuscan College of Architects and Engineers dealt exclusively with the reports and writings of the late Professor Poggi, of Florence, in regard to the principles to be followed in the conservation of national monuments, and the necessity for Government support.

Commendatore Alfredi d'Andrade, on behalf of the Italian Government, presented a number of publications dealing with the methods adopted by that Government for the preservation of ancient monuments.

A short discussion followed the reading of the papers, and the following resolutions were passed:—

That the Government should be empowered, whenever a case arises, to expropriate a monument which is historical.

That this International Congress of Architects recommend that the British Government be approached with a view to appointing a Royal Commission to control and to extend the operations of the Ancient Monuments Protection Amendment Act of 1900, and to prepare an accurate catalogue of the ancient monuments of the British Islands, taking similar action to that of the Department of Ancient Manuscripts, and in agreement with the measures adopted in other countries.

THE ARCHITECT'S CONTROL OVER THE CRAFTSMAN.

"To what extent, and in what sense should the architect have control over other artists or craftsmen in the completion of a national or public building?" This question was the subject of six papers presented to the Congress at the meeting on Thursday morning, the authors being respectively Sir William Richmond, M. Nénot (Paris), Herr L. B. Müller (Germany), M. Gaston Trélat (Paris), Professor Otto Wagner (Germany), and Signors Amargós, Padrol, de Miquelerena and Valeri (Spain).

Sir William Richmond urged the greater collaboration of the architect, painter and sculptor, and suggested that, on the initiative of the Institute, a society should be formed comprising a small number of each section of the arts—perhaps six architects, six sculptors and six painters—which might in time become an advisory body to the Government and to the London County Council, both of which needed assistance, not only in commonsense, but also in good taste.

M. Nénot instanced the case of the Sorbonne in Paris, of which he was the architect. At the time it was building, he said, a fresco about 80ft. long had been decided upon for the great amphitheatre, to decorate the part at the bottom which supports the cupola. The success depended on the tone of this fresco. Puvis de Chavannes seemed to be the right man. With him the white stone wall, almost entirely covered over, would continue to bear its cupola. But Benjamin Constant, appointed for another decoration in the same building, wished to be appointed to carry out this fresco, and the President of the Republic, M. Grévy, informed the Director of Fine Arts that he wished very much that he should be given the work. The position of the architect was painful. To resist the head of the State was a difficult matter, but on the other hand with the powerful pallet of Benjamin Constant the semi-cupola would no longer be supported, and the general harmony would be destroyed. M. Nénot declared that if he were forced to accept Benjamin Constant he would give up the fresco and substitute an architectural motive for it. Then he was allowed to have Puvis de Chavannes. "This should always be the case; instead of the architect having a certain artist forced on him he should be given a great freedom in the choice of his collaborators, and he himself must point out the artists and follow their work, without any other preoccupation than the general harmony of his work; and he should leave to the painters and sculptors, who are responsible for their work, every liberty of form or of colour, provided they do not prejudice that general harmony without which no architectural work can really exist."

The following resolution was passed:—

That the architect, in the construction of a building, is to be given absolute power over the co-operating craftsmen, but in a special manner over the co-operating artists.

ARCHITECTURE AND THE PUBLIC.

On this subject, dealt with at the Congress meeting on Thursday, no fewer than eleven papers were presented, the authors being Mr. John Belcher, A.R.A., Mr. T. G. Jackson, R.A., Mr. Arthur Hill, B.E., M.R.I.A. (lecturer on Architecture at Queen's College, Cork), Professor von Leixner (custodian of the Imperial and Royal Central Commission, Vienna), Mr. Banister F. Fletcher, F.R.I.B.A., Signors Carmona, March and Sacanella (Spain), Professor Otto Wagner (Austria), M. Gaston Trélat and M. Albert Mayeux (France), M. Gaston Anciaux (Belgium), and Professor Jean Gilson (Brussels).

Mr. Belcher said the first thing was for the public to unlearn much that had been wrongly learned. The superstitions of antiquity and the "styles" must be exploded, and it must be made plain that neither a smattering of archæology nor a superficial study of "styles" afforded a sound basis for a critical judgment in matters of present-day architecture. Moreover, architecture was not merely a question of a beautiful exterior; the importance of the plan and of sound construction needed to be pressed home. Truth and beauty were the two governing principles, and truth required that a church should look like a church, a town hall like a town hall, and a private residence like a private residence. An external shell of plaster over brick must not present the appearance of blocks of stone, nor a steel structure cased with terra-cotta suggest solid masonry. Again, it was not sufficient for a building, in fact, to be strong and secure—it must look so, it must satisfy the eye. An engineer might, by exact mathematical calculation, know that the conditions of security were amply fulfilled, but the architect had to see to it that the work presented an appearance of strength and solidity. The public should be trained to appreciate the proper use of materials, questions of light and shade, proportion, mouldings, &c., whether by lectures or by articles published in book form, and illustrations should be abundant.

Mr. T. G. Jackson emphasised the importance of the public being qualified to know good architecture from bad, as they were the employers with whom the choice of designs for new buildings rested. The knowledge of architecture should be part of a liberal education. There was a vast bibliography of architecture, and there were the various means of education by lectures and excursions; but all these were inadequate to qualify for a sound judgment in dealing with modern architecture, because they treated the subject mainly from the point of view of archæology. Mr. Jackson took the imagined case of an archæologist called upon to make a selection from a set of competition designs and pointed out that this archæologist's standard of merit would be based on conformity to precedent and ancient example. Archæology would never teach us to build up a new design sensibly and beautifully; moreover, it only touched the outside features of bygone styles, not their inner reasonableness, and so long as it was thought that the essence of a style consisted in its outward features we should fail to understand its true nature. It was very desirable that the course chiefly taken by writers and lecturers on architecture should be reformed on the lines suggested; but, after all, the best means of education was by the production of well-designed buildings. Architects, indeed, were the best teachers, and real work was more edifying than any books or lectures.

M. Anciaux agreed with those who advocated the giving of lectures in schools and the creation of museums of architecture, both in capitals and in the smaller towns of the country. M. Anciaux, in the course of his paper, quoted the following caustic sentences from an article by Camille Mauclair:—

> "It is not a question of placing an individual who swears, who spits, who shouts, who does not wash himself, before a masterpiece and thinking one has done one's duty by him. What is wanted is to lead this individual by persuasive teaching to the idea that it is the duty of every reasonable being to become more refined; and it is in this way that he will be rendered capable of understanding and recognising in a beautiful thing the common inheritance of his race. In a word, it is necessary to form the character of the people in order to prepare it for art, and not to expect that in putting it into direct contact with art it will be provided with a character. A working man may render himself worthy of appreciating a masterpiece, but a masterpiece has not the virtue and has not been created to refine a working man."

M. Mayeux associated himself with the teaching of architecture in schools and the production by the Congress of standard manuals on architecture for the use of public lecturers, while Professor Gilson made appeal for the influence of the Press, by publishing judiciously-written articles on architecture, commenting upon and bringing before the public the qualities and merits of those works which were really worthy of notice.

A PAPER ON THE TOMB OF AGAMEMNON,

or the Treasury of Atreus at Mycenæ, and the reconstruction of its entrance from fragments that have come into the possession of the British Museum, was read before the meeting of the Congress on Friday evening by Dr. Cecil Smith, Keeper of Greek and Roman Antiquities.

ARCHITECTS' REGISTRATION.

"A Statutory Qualification for Architects" was the subject of five papers presented to the Congress at its last meeting on Saturday morning, the authors being Mr. J. S. Archibald (Montreal), M. Louis Bonnier (Paris), M. Gaston Trélat (Paris), Professor Otto Wagner (Austria) and Mr. Robert Walker, of Cork.

Mr. Archibald pointed out that the Province of Quebec Association of Architects was the pioneer (on the western side of the Atlantic at any rate) of statutory qualification for architects, for this law had been founded in 1898 as an amendment to the Association's charter of incorporation. The law reads: "No person can take or make use of the name or title 'Architect,' unless he is recognised under this Act, and is a member of the Association."

M. Bonnier dealt with the diploma granted in France. The campaign, he said, was started as far back as 1840. The Central Society of French Architects took the initiative, and for more than twenty years fought the good fight, until in 1863 M. Eugène Guillaume obtained from the Government the decree instituting the diploma. After a period of modesty and obscurity, during which the first possessors of the diploma, without a bond, without influence, without protection, and treated as intruders, were the objects of attacks as furious as they were stupid, the architects with a diploma formed themselves into an association in 1877. For a great many years they struggled to live—to hold on. Slowly their numbers increased. When they had become 200 the hostilities grew less; and when they had become 500 they were at last recognised. To-day 750 were distributed over France, and in 1912 their number would be 1,000. This striking development and this uncontested prosperity of the diploma in France showed what an imperious want was answered by its creation.

M. Trélat considered that when diplomas were confined to being stimulants to young men to work they were excellent, but they became detestable if they trammelled the free activity of the architect in later life.

Professor Wagner said that if the architect were given a legal authorisation it could not be in respect of his artistic capacity, but only for his professional ability.

Mr. Walker was in favour of registration, and said there was no doubt the trend of opinion was in the direction of securing it.

In the discussion that followed the reading of the papers, Professor Nagy (Budapest) gave a brief account of what had been done by the Society of Hungarian Engineers, Mechanical Engineers and Architects, who now had a Bill before the Hungarian Parliament reserving the right of the title "architect" to those engineers, mechanical engineers and architects possessing proper qualifications from polytechnics or academies.

Mr. Alexander North, on behalf of the Tasmanian Association of Architects, supported registration. He observed that a Bill to that effect had been introduced by his Association in 1891 and again in 1892, but it had been thrown out by the legislature and had not been introduced since. It was satisfactory to note, however, that last year a Chair of Architecture was established at Melbourne University. This, at least, was some official recognition of the claims of architecture.

Mr. Ellis Marsland raised a protest against the subject having been set down for discussion at the same time as an excursion meeting of the Congress had been arranged elsewhere.

Mr. George Hubbard, Mr. Christopher A. Cowper (Royal Victorian Institute of Architects), Mr. G. A. T. Middleton, Mr. David Morgan (Cardiff, South Wales and Monmouthshire Architects' Society) and a representative of the Cape Colony Society of Architects spoke in favour of registration. The chairman (Mr. Edwin T. Hall) pointed out that the diploma granted in France was an honour, and did not restrict anyone from practising as an architect.

The following resolution was passed, only two voting against it:—

That it is desirable in the interests of the public of all nations, and of architecture, that all practitioners should have a statutory qualification.

THE GARDEN FETE.

One of the most successful functions in connection with the Congress was the Garden Fête, held on Wednesday evening in the Royal Botanic Society's grounds in Regent's Park. Mr. and Mrs. Belcher received the guests, numbering 3,000. The grounds were most delightfully illuminated with Chinese lanterns and fairy lights among the trees, music was given by the band of the Royal Horse Guards (Blue) and by a ladies' salon quintet in the conservatory, and a pastoral play, "A Midsummer Night's Dream," excellently acted by Mr. Patrick Kirwan's "Idyllic Players," added to the success of the evening.

FAREWELL DINNER.

The farewell dinner of the Congress was held at the Hotel Cecil on Saturday evening, Mr. John Belcher presiding. Sir William Emerson proposed "The Foreign Delegates," to which toast 14 replies were made, and Mr. Cass Gilbert proposed "The Royal Institute of British Architects," to which toast Mr. Belcher responded. The cover of the menu card was designed by Sir Lawrence Alma-Tadema, R.A.

The next Congress will be held in Vienna.

ARCHITECTURE AND CRAFTSMANSHIP.*

By Reginald Blomfield, A.R.A.

The idea of the architect-craftsman has been much in the air of recent years, and, owing to misunderstandings and some confusion of ideas, a good deal of uncertainty prevails as to the degree in which craftsmanship is necessary to an architect, and to what extent a training in the handicrafts should form part of his education. In this paper I shall endeavour to clear up these points, by tracing the historical development of this idea in modern thought, and by a consideration of the actual function of architecture.

In the earlier days of the Italian Renaissance the architect was almost invariably a craftsman of some sort, or rather it would be more correct to say that, as an artist, he practised architecture among other arts, turning his hand indifferently to architecture, sculpture, or painting. It was not till the middle of the sixteenth century that the architect detached himself from his brethren and specialised in architecture. The result was that inferior men usurped the control of the decorative arts. In France, for example, the architects were utterly routed by Primaticcio. In England, Inigo Jones was the only architect of the seventeenth century who went outside architecture in his remarkable designs for the Court masques; and the last of the Italians who retained the ambidextrous ability of the Renaissance was Bernini, an artist to whom less than justice has been done. As a general rule, by the end of the seventeenth century architects had ceased to trouble themselves with anything beyond their buildings. They practically limited themselves to architectural decoration, and so matters continued till the latter part of the eighteenth century, when architects again took it into their heads to embark on multifarious design. The solid tradition of neo-classic architecture was breaking up, the dilettante was so much interested in the art that he was beginning to lay down the law on architecture, and, for the first time in the history of the art, architecture became a matter of literary fashion. Design was mainly a matter of draughtsmanship without regard to materials, and, having no vitality, died the death it deserved, leaving the way open for all the fads and revivalisms of the nineteenth century.

In England, at any rate, architecture went plunging down the slope of sham mediævalism, with Augustus Welby Pugin leading the way, like the Pied Piper of Hamelin. I would not for a moment underrate the last stand of **the Old Guard.** Men such as Decimus Burton, or, a little later, Barry and Cockerell, maintained the last tradition of architecture as well as they were able in an age of rapidly spreading sentimentalism; and, except for the stand they made, we of to-day should be floundering about in a quagmire of scrap-book fashions, without a clue to any ideal, however remote. Such a clue, faint as it is, they left us, though they failed in the struggle, and English art sank to the lowest depths of degradation it is ever likely to reach at a date fixed for us, with curious irony, by the Great Exhibition of 1851.

Pugin died in 1852. Whether it was his enthusiasm, or the sight of so much accumulated ineptitude at that Exhibition that stirred some latent feeling for better things, it is now difficult to say, but the Exhibition marked a turning-point, and about this time there appeared on the scene that most interesting group of men, **the Pre-Raphaelite Brotherhood.** With the significance of the Pre-Raphaelite movement in regard to painting I am not here concerned, but I would draw attention to the astounding pronouncement of Holman Hunt and Rossetti that "architecture also came within the proper work of a painter, who, learning the principles of construction from Nature herself, would apply them by shaping and decorating the material he had to deal with." I cite this as evidence of the mental attitude of the young men of the movement towards the art of architecture fifty years ago. Mr. Ruskin, not to be left behind in zeal for the reformation of architecture, urged in his "Seven Lamps" that it was useless for an architect to study his art in cities. "Send him," he said, "to our hills, and let him study there what Nature understands by a buttress, and what by a dome." He might, indeed, but it would be something very different to what an architect has to understand by a buttress and a dome. But that would have made no sort of difference to Mr. Ruskin, who ended a prodigious flight of eloquence with a reference to "the old power of architecture," which "gives the Temple gate the depth and darkness of Elijah's Horeb cave." One should perhaps be thankful that he did not throw in Zeba and Salmana as well; for after Mr. Ruskin set the fashion, no one had a chance of getting a hearing on architecture who did not pepper his discourse with abundant references to the Eternal Hills and the pebble-stones by the seashore. That such views would lead to greater knowledge or skill in architecture was improbable; and the art itself ceased to be regarded, except as occasional material for copy.

Ford Madox Brown seems to me, in his strong grasp of the actualities of emotion, to have been the only genuine mediævalist of them all. It was he who inspired the Morris group and was one of the founders of the famous firm.

Morris meanwhile had tried architecture and given it up in disgust, and thereupon, with characteristic energy, had formulated a theory of architecture which boldly cut the knot. Architecture was to voluntarily efface itself, and be content with the part of a vehicle for carving, and ornament, and storeyed tapestry, and beautiful glass. To the achievement of this view Morris devoted half his life, and he adhered to it to the end; and there is no doubt that, as handled by Philip Webb, the realisation of this theory was sometimes beautiful and always profoundly interesting.

The genius of Morris, his personality, his enthusiasm, his lofty integrity of purpose, were irresistible to those who came within his range. We younger men sat willingly at his feet; two architects of ability relinquished architecture for the pursuit of the handicrafts; and in due course the Arts and Crafts Society came into existence. Thus the all-embracing revolution in the arts contemplated by the Pre-Raphaelite Brotherhood had, as the result of the personal temperament of one man, narrowed itself down to a half-despairing championship of the handicrafts—a championship that sought to promote its end by proclaiming the Liberty, Fraternity and Equality of the Arts, and has left us looking each other in the face, with all sorts of pretty things in hand and little or no idea what to do with them. It is out of these conditions and from these intellectual antecedents that the idea of the architect-craftsman has been evolved.

---

*Summary of a paper read at the meeting of the Congress on July 18th.

Architecture as a Science and Art.

We were taught in our youth that architecture is both a science and an art. Having little aptitude for science, I can well recollect the alarming vista of scientific study that this suggested. Chemistry, geology, higher mathematics, and so on, all would be necessary before we could hope to master the mysteries of this intractable art, and how was one also to study its forms and perfect oneself in the actual *mécanique* of design? I am not underrating the value of scientific knowledge to architects; we should, all of us, design more boldly if we had full scientific knowledge of statics and dynamics, and could handle the calculus as freely as our T-square; but the fact was that the conception presented by this formidable combination, "science and art," was a mere bogey. Architecture is not a science in the same sense tnat chemistry, botany, or geology is a science. It is bound to recognise the facts and laws of Nature; but, then, so does the art of sculpture in conforming to the facts of anatomy; and the real science of architecture is that knowledge of the effect to be aimed at, and of the means of realising it, which is the hallmark of the competent artist. When enthusiasts and others urge us to study Nature, they are only urging us to beat the air. Possibly they have still in the back of their minds the ingenious theory of forest trees and Gothic vaulting; perhaps they are only repeating a piece of cant. It is only by prolonged and intimate study of buildings—not merely of details, not only of the physical laws which govern construction and the conduct of materials, but by the study and analysis of the effects obtained in noble buildings, and by the search after the principles that govern their disposition—that we can hope to attain to mastery in architecture.

The End of Architecture

is to produce buildings which not only answer their varied purposes as enclosed and covered-in spaces, but also appeal to the æsthetic sense and to the imagination by the beauty and fitness of their forms, by their disciplined design, by rhythmical combinations which appeal to some such instinct within us as is touched by great orchestral music.

Now, this aspect of architecture is one that seems to have dropped out of view in the last 50 years or so. It formed no part of the Gothic Revival—a Revival that concerned itself almost entirely with details, cusps and crockets, mouldings and tracery, tiles and vestments, and all the other knicknacks and gewgaws of that preposterous anachronism. Neither did it occur to the Pre-Raphaelite Brotherhood or their successors. Morris did, indeed, attack detail in genuine earnest; but the view of architecture as the architectonic art, the art that controls and orders the crafts, was not compatible with the socialistic ideal of art; and it was only the logical, if unconscious, result of that ideal that this view should be repudiated, that in its place we should be offered the noble army of craftsmen, all tumbling over each other in their haste to invest our ineffectual efforts with artistic merit. I cannot think the results have justified the enthusiasm of 20 or 30 years ago. Hell, they say, is paved with good intentions; so is much of our modern decorative art in England, work done with laudable zeal, but with inadequate technique. Amongst other things, we find "Art Nouveau" confronting us as a monstrous result of mere craftsmanship divorced from architecture. The socialistic ideal of art, the ideal of unalloyed craftsmanship, has been tried and found wanting. The future, in architecture at any rate, is not with the socialist, but with the individual master-mind.

Knowledge of Materials.

The architect must be acquainted with his materials, and as a student should see actual bricks being laid, actual masonry set out and worked, and the essential methods of lead, steel and iron work in operation: but it is of the first importance that the student should keep steadily before him the end in view. He is not there to qualify himself as a bricklayer, or a plumber, or whatever it may be, but in order that he may learn to know his way about among those crafts when he himself comes to deal with buildings.

All, therefore, we can hope to do in the training we offer to our students is to lay a good foundation, to familiarise them with the use of their tools and materials, and to give them some insight into the means available for architectural expression. In doing so it is essential to keep before the student the ultimate end of all this training—namely, skill, not in draughtsmanship nor in craftsmanship, but in architecture. It is because this point of view has been lost sight of in the cross-currents of thought of the last fifty years that I have ventured to criticise the distinguished men to whom I have referred in this paper.

No one can be more sensible than I am of all that we owe to the genius of William Morris, and, indeed, to the ability and enthusiasm of the younger generation who started the Arts and Crafts Society. But the unintentional effect of that movement has been to substitute craftsmanship for architecture, and to allow architecture to exist only on the sufferance accorded to the man who blows the bellows.

THE RELATION OF MODERN ARCHITECTURE TO CRAFTSMANSHIP.*

By W. R. Lethaby.

The forms which run so readily from the point of an architect's pencil are decayed and degraded memories of the discoveries once made by ancient craftsmen. Whence, then, is new energy in modern architecture to be derived? In part it may come from the investigations of science applied to the solution of the compelling forces of civilisation; but we want a vital and resourceful craftsmanship which shall be able to deal with such new ideas and interpret them in proper terms. As at present conducted, however, the profession of architecture is shut away almost completely from any direct relation with workmanship. Some of our most gifted architects, feeling the workmanlike interest of old architecture, but perhaps understanding its source incompletely, have tried to give their buildings the *appearance* of interested handiwork and masterly ease; they have designed roughnesses and even accidents; they have tried to bring back the semblance of old ways of doing things; but such a procedure is but one more partition between us and the veracities of art, and one more burden to the labour thus called in to parody labour.

A work of architecture must be as real as a ship—that is, shaped by the primal facts of existence.

Contact with labour may mean several things besides the one that we have now to consider. We need, for instance, to be in closer touch with the executants of our buildings, and to be anxious to learn from them what *they*, the artists, think is good work, and what improvements of method they can suggest. I am sure we need to open out a way for promotion from the ranks; we need to arouse an interest right down through the whole body of those engaged in building; and we must recognise that at present, so far as the initiation of art is concerned, modern architecture is the result of practically servile labour, and necessarily bears that mark.

In the second place, contact with craftsmanship may mean the acceptance by the scientifically-trained directing architect of the help of independent expert assistance from workmen of a high order—painters, sculptors, metalworkers, modellers, and the like—and the sloughing-off of the ordinary wrappings, shrouds even, of office-designed ornamentation. It will, I think, be necessary to come to some sort of Home Rule in the arts associated with architecture, so that a metalworker shall be responsible for the design of metalwork, and a glazier for glass, as well as a painter for paintings, and a sculptor for sculpture. It is as absurd for an architect to design ornamental metalwork as it would be for him to design oil paintings to be carried out by hireling labour.

To come to our immediate subject—"How far should the architect receive the theoretical and practical training of a craftsman?"—the idea underlying this enquiry is, I have found, liable to misinterpretation in at least two ways. It is laughed at as a mere whim, as though it were proposed that the architect should make his own mortar and lay his own bricks; or, secondly, it is received as a sort of new gospel, and then immediately the initiate is likely to show his interest in craftsmanship by taking up enamelling, gesso-work, or wood-carving.

The craftsmanship I have in view is a course of workshop training in masonry and carpentry, so long as they remain the principal factors in construction. So understood, craftsmanship should form the basis of architectural education. However desirable it may be to train some men to the highest degree of academical skill, administrative ability and draughtsmanship who may be able to deal with the complicated problems of practice in a big city, it must be remembered that a far vaster volume of building work consists of tasks of a humbler nature, tasks which a highly-trained expert is too refined to deal with satisfactorily. Such works need the intimate handling of those who perhaps have rougher faculties. I hold it for certain that the more we elaborate (and possibly of necessity elaborate) the education of architects who are to practise in large cities, the more we are making it difficult to supply the everyday needs of the country. I see, then, in a basis of craftsmanship not only a necessary part of the education of all who are to be architects, but a way of opening out channels for diversities of gifts which may correspond with the diversities of requirement.

---

* Summary of a paper read at the meeting of the Congress on July 18th.

Notes and News

New Cattle Markets and Slaughter-house for Edinburgh are proposed to be erected at Gorgie from plans prepared by the City Superintendent of Works.

The Aberdeen Architectural Association, under Mr. G. G. Irvine, the president, recently paid a visit to the Strabathie works of the Seaton Brick and Tile Co.

Liverpool Cathedral : the Chapter-House.—On Tuesday, last week, the Duke of Connaught laid the corner-stone of the chapter-house of Liverpool Cathedral.

Messrs. Roger Smith & Son, of 130, Temple Chambers, Whitefriars, E.C., have taken into partnership Mr. Harold E. Church, A.R.I.B.A., as from July 1st.

A Working Men's Institute at Gorseinon has been erected from designs by Mr. Ruthen, of Swansea. Mr. G. Mercer, of Llanelly, was the builder.

A large portion of the ceiling of Dungan Catholic Church, county Roscommon, collapsed recently, injuring about forty people. The church has only lately been erected.

A Booklet on "The Natural Ventilation of Churches" has recently been issued by the well-known firm of ventilating engineers, Messrs. Robert Boyle & Son, of High Holborn.

A New Free Library at Northampton, for which Mr. Carnegie has given £15,000, is to be erected in accordance with plans prepared by Mr. Fidler, Borough Engineer and Surveyor.

Restoration of Carnarvon Castle.—The Office of Works has been instructed to send its architect to Carnarvon to confer with Sir John Puleston, custodian of the castle, with a view to a more ample restoration of the old edifice.

Cracks in the Vatican.—Many of the walls of the Vatican, at Rome, are cracked and bulging, owing to the weight put upon them in the course of centuries of internal alterations, and it is estimated that restorations costing £20,000 will have to be carried out at once.

House of Commons Ventilation.—A White Paper on the ventilation of the Houses of Parliament has just been issued. Numerous recommendations of detail are made, including one for the alteration of the position of the cotton-wool intake on the terrace side.

Lambeth Municipal Buildings.—On Saturday last Alderman Powell, J.P., F.R.I.B.A., mayor of Lambeth, laid the foundation stone of the new municipal buildings to be erected at the junction of Brixton Hill and Acre Lane. The architects are Messrs. Warwick & Hall.

The Lewisham Borough Council have under consideration a scheme for erecting workmen's dwellings on four and a half acres of land at Lee. The total estimated capital charge will be £29,130, made up as follows :—35 houses at £250 each, 35 houses at £400 each, four and a half acres of land at £1,000 per acre, road and sewer expenses £1,870.

Birmingham Lying-in Home.—A central home in Loveday Street in connection with the Birmingham Lying-in Charity is being erected to provide a building in which pupil midwives may complete their training, and where those maternity cases can be received which are so serious as to need special treatment. It will provide accommodation for 16 patients and the necessary staff. The total estimated cost is £12,500.

A Wesleyan Mission Hall and School is in course of erection at Lytham, at a cost of £3,000. Mr. Herbert Wade, of 27, Birley Street, Blackpool and Mr. Walter Wade, of Bank Chambers, St. Annes, are the joint architects. Mr. H. Mogridge, of Lytham, has secured the general contract; and Messrs. Saunders and Taylor, of Manchester, will carry out the heating and ventilating arrangements.

Irish International Exhibition, 1907.—The buildings of this exhibition, which is to be held in Dublin next summer, have been designed by Messrs. Kaye-Parry & Ross, architects, of Dublin, and are being erected by Messrs. Humphreys, Ltd., of London. The main building will comprise a central octagonal court 215ft. in diameter surrounded by a corridor opening into four radial wings, each 164ft. long by 80ft. wide. Over the court will be an octagonal dome 80ft. in diameter and 150ft. high. Around this main building will be grouped a number of pavilions—machinery pavilion, concert hall and restaurant, art gallery, &c.

Messrs. Mellowes & Co., Ltd., of Corporation Street, Sheffield, have secured the orders for glazing, on their "Eclipse" patent imperishable system, the roofs of the extensions to the works of Messrs. Cammell, Laird & Co., Ltd., Sheffield; Cadbury Bros., Ltd., Birmingham; Tranmere Bay Development Co., Ltd., Birkenhead; Crawford's Biscuit Works, Leith; Kitson & Co., Ltd., Leeds; Redpath, Brown & Co., Ltd., Manchester; Coventry Ordnance Works, Coventry and Glasgow. Also export orders for Holland and South Africa.

Birmingham Post Office : Proposed Extension.—A Bill is now before Parliament to acquire land in Paradise Street, Birmingham, and to take the old post office (now occupied by the Inland Revenue authorities) for the purposes of additional postal accommodation. The Post Office authorities have acquired the whole of the land between the Inland Revenue Office and Queen's College, as well as a site in the rear. Nearly three years must elapse before all the leases expire, and then, if not before, it is anticipated that a commencement will be made upon the extension scheme. It is not likely that it will be necessary to interfere with the exterior of the old post office; but there will be a complete rearrangement of the interior. A huge subway will be constructed under Hill Street connecting the two buildings.

Strand Improvement Scheme Rejected.—The Improvements Committee of the London County Council have reported that they are unable to recommend the suggestions for altering the northern frontage of the Strand put forward by Mr. Hamo Thornycroft, R.A., the Further Strand Improvement Committee, and the Royal Institute of British Architects. They state that after the most anxious consideration of the matter they feel "that the Council would not be justified in incurring so large an expenditure as would be involved in securing a doubtful enhancement of the architectural view in the Strand. Having regard to the great width already provided (100ft.), it will be possible to secure under the Council's scheme an imposing effect for the buildings to be erected on the northern side of the Strand."

Correspondence.

Finchley Cottage Hospital.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—We should not have intervened in this matter had it not been for the remarkable editorial which you append to Mr. Bacon's letter. In the first place, whatever your views may be as to the necessity for isolation wards in connection with a cottage hospital, the conditions of the competition required certain definite provision for isolation, the purpose of which was further elucidated in answer to a question which we ourselves put to the secretary. It was, therefore, not open to any of the competitors to provide wards obviously unsuited for the purpose of isolation and to explain that they could be used for paying patients. Such a suggestion is quite *ultra vires*, and for this reason alone the plan is clearly disqualified.

We do not wish to enter into any controversy as to the relative merits of the designs, whatever may be our own feelings on the matter (and we have suffered much from incompetent assessors in the past). In entering the competition we submitted to the judgment of the three assessors and we must abide by the result, but we would remark in reference to your statement that isolation wards should have no place in a cottage hospital that this is a view which would be upheld by no one conversant with the needs of an institution of this kind. Some provision for the isolation of infectious cases is an absolute necessity in the very smallest cottage hospital. It is within the knowledge of anyone who is at all familiar with the working of similar institutions that cases do and must arise which cannot be removed to an isolation hospital; and, furthermore, that the contingency must be provided against of the only available isolation hospital being full.—Yours truly,

LONDON, W.C. YOUNG & HALL.

[We still maintain that isolation wards are not necessary in a cottage hospital. If a case occurred which required isolation it would be at once removed to the nearest hospital for infectious diseases. In the contingency of this latter being full, the isolation wards in the scheme in question would still be available—if not otherwise occupied—without detriment to the access to the extension, for they have been planned with an air disconnection from the main corridor in the form of a ventilated lobby. The term "isolation ward" in a hospital of this class is a misnomer; separation ward would be more correct.—ED. B. J.]

Pecksniff's Defence.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The arguments (?) of the superior person who hides his identity under the title of "Pecksniff Minor" are sufficiently silly to carry their own refutation. Personally I have no objection to admitting a middle-class admiration for the works of Charles Dickens, but can a gentleman (a member of the aristocracy, I presume) who practises architecture as a "trade" afford to throw mud at we inferior people who endeavour, however unsuccessfully, to practise it as an art? As to the efficacy or otherwise of registration, there are thieves in spite of policemen. Being a tradesman, this "Pecksniff Minor" thinks only of the money to be made out of his trade (there are instances of considerable fortunes being made by architects proper), and it would, of course, be mere waste of time to try to convince such an one that other ideals actuate other men and induce in them a desire to sign their own work as they do their letters to the Press.—Yours truly,

SIDMOUTH. R. W. SAMPSON.

Unsatisfactory Competitions at Tyneside.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Unsatisfactory competitions in the Tyneside district appear to be epidemic, the latest being the Tynemouth Education Committee's proposed school in Preston Avenue. The facts are:—The Education Committee invited 12 architects to submit designs for a new school to accommodate 1,300 children. A professional assessor (Mr. R. J. Leeson) was appointed, and his duties, according to the condtions, were to select the designs first, second and third in order of merit, and to report to the committee. This was done, with the result that the plans marked "H" were awarded first place, those marked "J" second place, and those marked "G" third place. A committee of three members, consisting of two builders and one house-agent, was then appointed to look over the plans and report to the General Committee. They proposed that the order of the award should be altered—namely, "G" first, "H" second, and "J" third. This proposal the General Committee did not agree to (all honour to them), but they adjourned the meeting until early in September so as to enable the assessor to attend.

There are evidently some influences at work to get the award altered, and the attendance of the assessor has, no doubt, been suggested with a view to either getting him to acknowledge his inability to judge plans or to persuade him that the two builders and one house-agent know more about schools than he does. It will be very interesting to watch the result of this comedy, as the hon. secretary of the Northern Architectural Association, Mr. A. B. Plummer, F.R.I.B.A., is one of the committee, and there is also the Mayor, Alderman J. P. Spencer, an architect, on the committee; likewise two clergymen and three or four builders, besides other well-known gentlemen and one lady.

No doubt the local Architectural Association, under the able guidance of the president, Mr. J. T. Cackett, F.R.I.B.A., will move in the matter, and it would do no harm if the London Institute lent its aid.—Yours truly, "UNION."

Notes on Competitions

Finchley Cottage Hospital.

Our comments upon this competition, which appeared in our issue of July 4th, appear to have irritated the chairman of the Finchley District Council, who presided at a meeting of subscribers to the Finchley Cottage Hospital Fund recently. The chairman is Mr. E. A. Woodrow, F.R.I.B.A., and it was he who formed one of a sub-committee of three which was appointed to report upon the designs, the other members being, respectively, a doctor and a late secretary of Bartholomew's Hospital. We stated, in respect of the award—which we considered unsatisfactory—that "it is but fair to assume that the medical view has out-balanced the architectural one." On account of this remark the chairman complains that he has been accused, by a trade journal, of being coerced by his medical colleagues, and he goes on to state that "in self-defence he must tell them (the subscribers) that he visited the room in which the plans were hung every morning for a week and he spent an afternoon there as well. Then he wrote his report and his decision, and, shortly afterwards, met his colleagues on the selection committee, who had, like him, individually and alone, made their selections. And all three selections were the same." We felt so strongly that neither the best design had been selected, nor even the second best, that we could not conceive of an architect member of an assessing committee taking any other view than ours, and that is why we arrived at the charitable assumption that the medical opinion had outweighed the architectural; we certainly never hinted at coercion. Well, we are profoundly regretful that we were wrong. Mr. Woodrow further remarked, "He did not care a button what *The Builders' Journal* said, but he did care very much what subscribers thought. The article was obviously an inspired one, inspired by an unsuccessful competitor, as shown by extracts from a private letter sent to him." Now we must disclaim most emphatically that our article was inspired. We always endeavour that a representative shall attend exhibitions of competition designs, and Finchley was visited in the ordinary course. The comments which we published were made according to conviction and without bias. The extracts from a private letter sent by a competitor to the Hospital Committee were obtained through enquiry after the criticisms upon the award had been written.

Competition for London County Hall.

The announcement will be read with pleasure that the Establishment Committee of the London County Council recommend the holding of a double competition for the new County Hall to be built on the south side of the Thames, next to Westminster Bridge. A communication was made to the Council by the Institute expressing a hope that it might have the privilege of advising the Council in the matter of securing designs for this important building in which "an exceptional opportunity will occur of realising the educational value of the art of architecture and of fostering the arts and crafts of the day." The Establishment Committee expressed their willingness to consider any suggestions which the Institute might make, and subsequently the Institute expressed the opinion that the only way of securing such a result as the Council naturally desired was to obtain, "by some means or other, a strongly individualised personality to deal with the problem under properly defined conditions," and the Institute suggested that the method most likely to achieve that result would be to institute a competition. In support of this view they called attention to the fact that the designs for the Houses of Parliament and the Foreign Office in London, the Hotel de Ville, the Opera House and the Palaces of Art in Paris, the Houses of Parliament in Berlin, and the Central Library in New York, were all selected in competition. The Institute recommended the holding of a preliminary and a final competition, and suggested that some of the leading architects should be invited to compete in the final stage. The Establishment Committee, having given careful consideration to the various suggestions, accepted the proposal of a double competition, the preliminary one to be open to architects of any nationality, "and that not less than 10 and not more than 15 of the best designs shall be selected in private by assessors"; the final stage to be open to "(1) the authors of the designs selected by the assessors in the preliminary stage, and (2) not exceeding eight leading architects to be invited by the Council to send in designs before the expiry of the period within which designs must be sent in for the preliminary competition." The Committee think there should be two assessors for the preliminary competition and three for the final, and that Mr. W. E. Riley, the Council's architect, and Mr. Norman Shaw, R.A., should be nominated to act in both stages, and that the competitors in the final stage should vote for the third assessor, who will only act in that stage. The committee suggest that each of the competitors in the final competition should be paid a fee of 200 guineas. Next week they will report as to the remuneration of the assessors, and also as to the date by which the designs should be sent in. It is suggested that the Council's architect should prepare detailed particulars of the accommodation required, and the committee propose to make it a condition that the successful competitor, if appointed, shall collaborate with the Council's official architect, "who should have discretionary power in all matters relating to the internal economy and construction of the building."

Central Public Library, St. Pancras.

The result of this competition will be made known to-night at the meeting of the Borough Council. A public exhibition of the drawings will be held at the St. Pancras Town Hall on Thursday, 26th, and Friday, 27th insts., from 9 a.m. to 3 p.m., and on Saturday, 28th inst., from 9 a.m. to 1 p.m. The competitors are Mr. Maurice B. Adams, Messrs. Cross & Mallows, Mr. J. S. Gibson, Messrs. Russell & Cooper, Messrs. Wills & Anderson, Mr. E. W. Wimperis. The assessor is Mr. John Belcher, President R.I.B.A. The designs were sent in on June 15th last, and the estimated cost of the building is £20,000.

Joint Isolation Hospital, Stone.

In the competition for a joint isolation hospital to be built at Stone, Staffordshire, limited to architects in the district, the design of Mr. J. J. Chapman, of Stone, has been placed first by the assessor, Mr. William A. Pite, F.R.I.B.A., whose award has been adopted. There were four other competitors.

Competitions Open.

The following is a list of competitions open:—

DATE OF DELIVERY		COMPETITION.
July	28	BATHS AT PRIMROSE MEADOWS, SHEFFIELD. Limited to Sheffield architects. Premiums of £30, £20 and £10. Particulars from Town Clerk.
Sept.	20	SCHOOL AT SUNDERLAND. Limited to local architects. Premiums of £50, £20 and £10. Particulars from John W. Moncur, borough engineer, Town Hall, Sunderland.
Sept.	28	SEWAGE DISPOSAL SCHEME FOR ELLESMERE. Premium of £20. Particulars from R. E. Lloyd, Clerk to Urban District Council, Ellesmere.
Sept.	29	REBUILDING OF HENSHAW'S BLIND ASYLUM AT MANCHESTER. Limited to Manchester architects. Premiums £100, £50, and £25. Assessor, Mr. John Holden, F.R.I.B.A.
Oct.	1	ALPHABET COMPETITION. Prizes of £20, £10 and £5. For particulars see "Architectural Review."

R.I.B.A. EXAMINATIONS.

Model Answers by A. G. Bond, B.A., A.R.I.B.A.

The Intermediate Examination.

(*June 12th*, 1906.)

Subject III.—THE ORDERS OF GREEK AND ROMAN ARCHITECTURE: THEIR ORIGIN, DEVELOPMENT AND APPLICATION.

[*Time of examination, one hour and a half. The first two questions to be attempted, and not more than two others. Maximum number of marks* 50.]

1. *Draw a section through a Greek Doric and another through a Roman Doric entablature, each 4ft. high, to one-eighth full size, naming the principal parts and members. State the height in feet you would allow to the supporting column in each case.*

The sketches give the two sections required and the principal parts are named thereon, but owing to the reduction in scale the heights of the columns may be stated as approximately three times that of the entablature in the case of the Greek example and four times in the case of the Roman example.

2. *Sketch to scale, as large as the paper will allow, an example of a Roman triumphal arch. The composition and proportions of the principal parts to be clearly shown, but detail is not required.*

See illustration.

3. *Is there any difference of treatment proper o a pilaster in the Greek and Roman styles? Illustrate an example in each style.*

Pilasters were called "antæ" by the Romans and "parastatæ" by the Greeks, the latter word implying their usual position, as "standing against" another member. As a matter of fact, they are almost in all cases "engaged," or part of the wall behind, in both styles, the chief difference in treatment being that the Greeks formed their pilasters of the same width at bottom and top, and with capitals and bases different from those of the Order with which they were used, whereas in Roman work it is usual to find the same treatment applied to both, including the upward diminution. Good examples illustrating these differences may be found in the Erectheum (see sketch). The triumphal arch illustrating question 2 shows the usual form of the Roman Corinthian pilaster.

4. *Describe and illustrate by sketches the method in which the Orders were generally used in the domestic buildings of the Romans.*

The two principal sources of information from which we can answer this question are:—(1) The Palaces of the Roman Emperors, of which, perhaps, that of Diocletian at Spalato affords the most striking variations from the normal use of the Orders, and (2) the remains of private houses at Pompeii, in which the most common variation is the use, in the "peristyle," of columns supporting a roof by means of a simple beam without the usual entablature. In the sketch-diagrams given to illustrate these variations, that marked (*a*) refers to the use in the peristyle and those marked (*b*) and (*c*) are from the palace of Diocletian. The latter indicate respectively the use of subordinate Orders with wall arcades standing on corbels, and having a fragment of the entablature returned upon itself over each abacus, and, secondly, the use of an arch with mouldings of the same contour as the entablature mitred and turned to spring from the abacus of the capital.

5. *Describe as briefly as possible the various forms of plan of the Greek temples, from the simplest to the most elaborate.*

The plans of Greek temples are generally classified according to the number of columns carrying the pediment, and by the method of carrying the entablature along the periptery, and the use or non-use of a rear portico or posticum. Thus, of the examples illustrated, (*a*) is called distyle in antis (having no prostyle, or projecting portico—if it had a similar portico at the other end it would be called amphi-distyle in antis). The next in order of size (*b*) was the temple with projecting porticoes carried by four columns—amphi-prostyle, tetrastyle: (*c*) is an example of the next development, the addition of a "periptery" involving the use of at least six columns in front—peripteral hexastyle: while (*d*) differs from the last in having eight columns in front—octastyle, but still only "peripteral" (an octastyle temple might logically be expected to have two rows of columns round the cella and so become "dipteral"). The plan marked (*e*) is pseudo-dipteral octastyle; it is of the size and general form of a dipteral temple, but the inner peristyle is omitted, leaving a wide space or ambulatory. (*f*) shows an example of irregular planning, being a combination of three temples.

6. *How were the Greek temples lighted?*

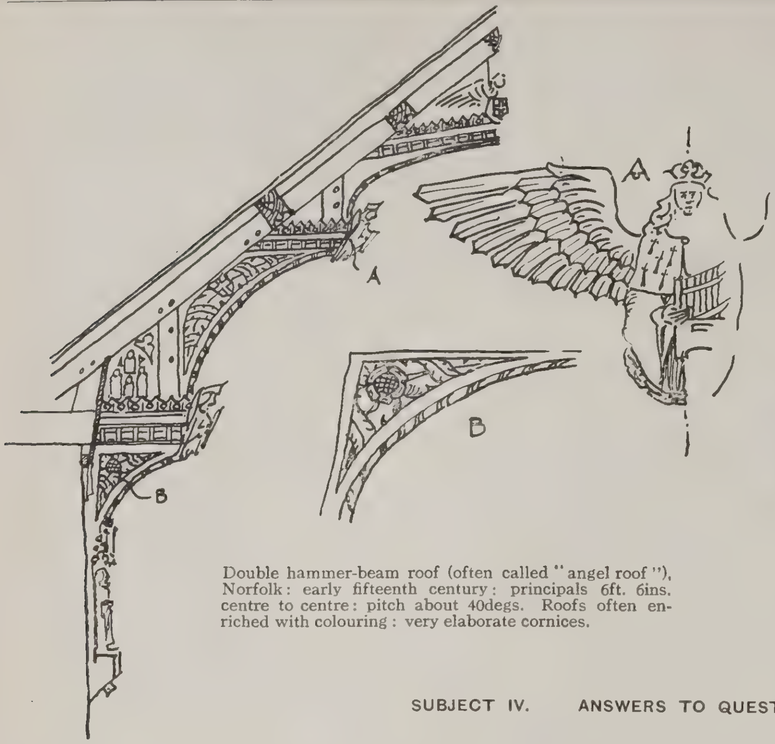
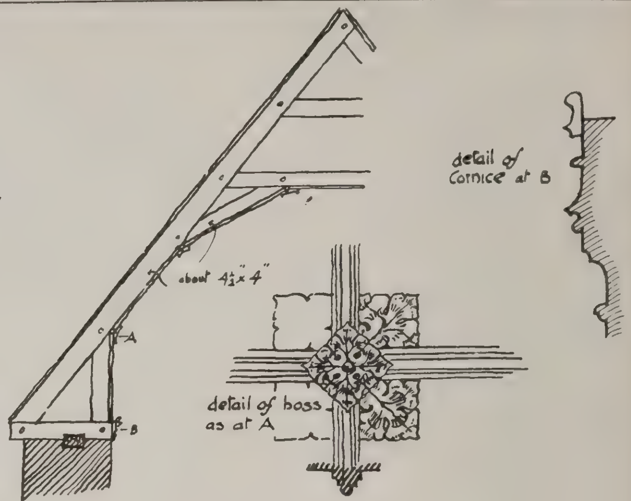
R.I.B.A. INTERMEDIATE EXAMINATION. SUBJECT III. ANSWERS TO QUESTIONS 1—6.

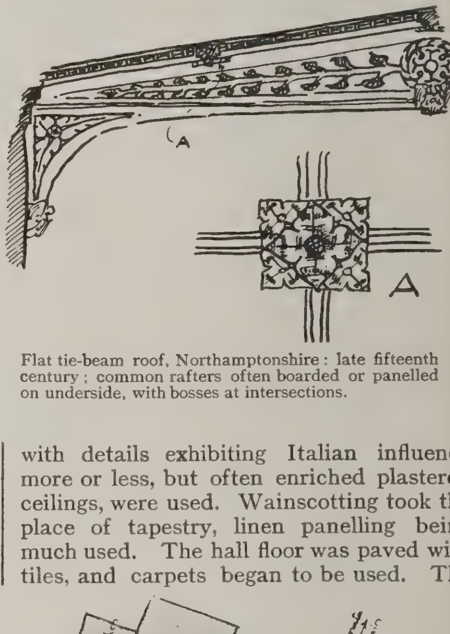


Double hammer-beam roof (often called "angel roof"), Norfolk: early fifteenth century: principals 6ft. 6ins. centre to centre: pitch about 40degs. Roofs often enriched with colouring: very elaborate cornices.



Trussed rafter roof, Norfolk: early fourteenth century: without principals: rafters about 1ft. 9ins. centre to centre: pitch about 50degs. Roofs often quite open (*i.e.*, not boarded or panelled).

SUBJECT IV. ANSWERS TO QUESTION 1.



Flat tie-beam roof, Northamptonshire: late fifteenth century; common rafters often boarded or panelled on underside, with bosses at intersections.

important theories which have been put forward in reference to the method of lighting probably employed. In the sketch sections *(a)* is Fergusson's theory—the clear-story system, and *(b)* is Bötticher's theory—the skylight system. Temples dedicated to Zeus were probably hypaethral, or open to the sky, and hence needed no other means of lighting. Other means which have been suggested are (1) by the doorways, (2) by means of translucent marble tiles, and (3) by artificial means. Certainly windows were quite the exception, though they occur at Agrigentum, in the great temple of Zeus, and in the Erectheum.

Subject IV.—OUTLINES OF THE HISTORY OF MEDIÆVAL AND RENAISSANCE ARCHITECTURE IN EUROPE.

[*Time of examination, one hour and a half. Not more than four questions to be attempted. Maximum number of marks* 75.]

1. *Describe and illustrate by rough sketches three types of open timber roofs which prevailed during the mediæval period, and assign approximate date and locality to each.*

See illustrations.

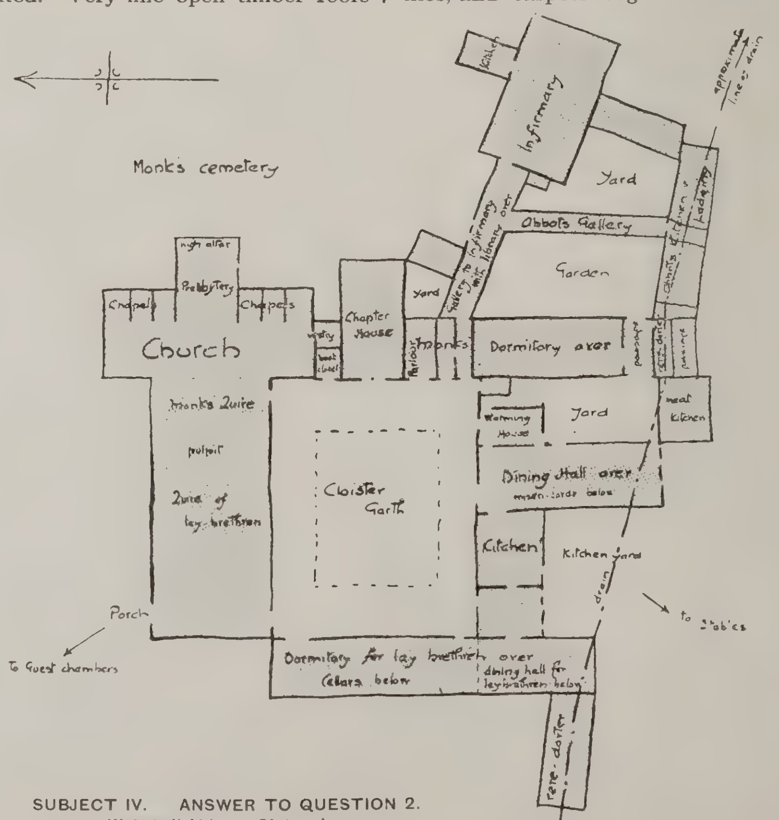
2. *Give a clear outline plan of some famous English monastic building (including its church). Mark on the plan the names of the parts or buildings, and explain briefly their several purposes, or uses.*

See sketch plan of Kirkstall Abbey.

NOTE: In answering this question the student would of course give the example with which he was most familiar. Perhaps the conventual buildings around Westminster Abbey would be the example generally selected, and it is a very typical one.

3. *Give a brief account of the condition and characteristics of English domestic architecture in the first half of the sixteenth century.*

Many castles were built in this period. The fortified character gradually disappeared and they may more strictly now be called mansions. Examples are Compton Wynyate house, Warwickshire; Hengrave Hall, Suffolk; and Thornbury Castle, Gloucestershire. In these examples, as in the colleges of this period, the quadrangle is the governing feature of the plan. Many of the colleges of Oxford and Cambridge are fine examples of this style—Magdalene and Brasenose and Corpus Christi, Oxford, may be mentioned; also many "hospitals" which were founded during this period, as, for instance, Ford's Hospital at Coventry, and the Inns, such as that at Glastonbury. The market cross at Glastonbury is also an interesting example of the period. After the time of Henry VII. many Italian features were introduced, and the influences discussed in the answer to question 4 began to be felt very strongly. The characteristics of the domestic work of this period may be summarised as follows: Fireplaces took the place of the central hearth with louvre in roof above. Ceilings of bay windows and other recesses were fan vaulted. Very fine open timber roofs with details exhibiting Italian influence more or less, but often enriched plastered ceilings, were used. Wainscotting took the place of tapestry, linen panelling being much used. The hall floor was paved with tiles, and carpets began to be used. The



SUBJECT IV. ANSWER TO QUESTION 2.
Kirkstall Abbey—Cistercian.

custom of sleeping in the hall was discontinued and numerous small sleeping chambers were provided. The solar increased in importance and was called the with-drawing room. Stained glass was used in the hall and principal apartments. A good many half-timbered houses were built. Gatehouses were treated as a most important feature. Brickwork and terra-cotta were employed as well as stone, especially in the Eastern Counties.

4. *Describe in what ways English architecture was affected by the movement known as the Renaissance.*

Architecture in England was very gradually affected by the Renaissance movement, which made itself felt first at the beginning of the sixteenth century in minor features in tombs and chantries and in the detail of larger buildings, ultimately affecting the whole design. The change of thought was not favourable to church building, but the richest of the new nobility encouraged a taste for grandeur and dignity in outward life that required great houses for its display. It is therefore in the great mansions that the conflict of the styles is best illustrated. At Hampton Court, at Layer Marney tower, and in some degree at Compton Wynyates and Hengrave, Italian influence is seen in the ornament, but at Nonsuch Place, built by Henry VIII., it was much more in evidence. Not until Kirby Hall do we get any drastic alteration in the plan. Here the entrance gateway and screens are on axial line and the inner court quite symmetrically treated. An entirely symmetrical plan for the whole building was originally intended by John Thorpe. The tendency was always towards symmetry, even at the cost of convenience. The hall decreased in importance as the staircase and other apartments increased. At first classical features were very much modified, and were used in conjunction with mullioned windows and stepped gables and parapets and chimneys full of Gothic feeling, ornamented with scroll and strap work, but at the begining of the seventeenth century Inigo Jones, who had studied in Italy, followed Palladio very closely; later the designs of Christopher Wren, who was given almost a free hand in London after the Great Fire, exhibiting as they did a most practical and common-sense treatment of the Renaissance style, had a very powerful and lasting effect on English architecture, and not until long after his death, when architecture had become a mere pedantic copyism of foreign work, did a reaction take place known as the Gothic Revival, which permanently affected church work only. Even to the present day the influence of Jones and Wren is to be traced in much modern work.

5. *By what influence was the rise of Renaissance architecture in Italy affected? In what respects do Florentine, Venetian and Roman Renaissance work differ the one from the others?*

Gothic architecture never became really nationalised in Italy, even in the parts nearest German and French influence, and the Gothic buildings there are poor in comparison with those of Northern Europe. Classic forms were those in which the Italians naturally expressed themselves, and they at once returned to them when the great revival of the arts in the fifteenth century and the prosperity of the large Italian cities created a demand for palaces and churches. A style of architecture was developed in which old forms were used in new ways, and which became known as the Renaissance style. The fall of Constantinople in 1453 flooded Italy with Greek scholars, and the discovery of a new world by Columbus and Cabot had a stimulating effect. The invention of printing disseminated the knowledge thus acquired. The movement in art combined faultless construction to extraordinary fertility of design. Italy was the centre of the upheaval. The study of old examples was soon reduced to mere methods of design, and architecture became the capacity to clothe the new buildings with old forms. The work in Florence, Venice and Rome may be compared in the following way:—

Florentine.	Venetian.	Roman.
Early. Solidity and simplicity. Rusticated masonry. Small windows on ground floor. Great main cornice. No use of Orders, or very little, Mouldings elegant, refined, but small. *Late.* Greater use of classic Orders and pediment. Plain wall surfaces almost disappear. Mouldings bolder and richer, but less refined. Flat pitched tiled roofs. Great shields at angles the chief ornament.	More varied and picturesque. Gothic influence greater. Pointed arches. Orders subordinated. Entablature broken round the columns, and Orders used in successive tiers. Windows large and grouped together in central portion. Little rusticated. Shell ornament typical. Built on canals, therefore entrance with steps, but without portico projections. Balconies much used. Roofs with balustrades. Much high relief figure-work in spandrels, &c.	Varied planning on grander scale. Constant applications of the Orders. St. Peter's exerted a great influence. Pilasters and cornices are of small projection. Large mass of wall to openings. One bold cornice, Pilasters instead of columns, generally two storeys united by one large Order. Openings square headed Quoins rusticated. Roofs not as a rule visible. Mouldings pure classic.

[Answers to questions set in Subjects I. and II. were published in our issue for July 11th.]

Enquiries Answered.

Brown Spots on Granite.

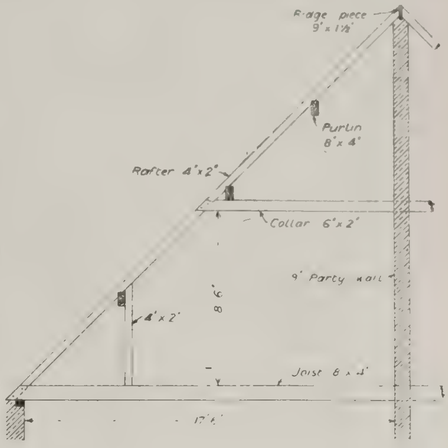
QUERIST writes: "On a building in course of erection a number of brown spots have appeared. The stone is a light grey granite (there are also traces of iron spots). Spirits of salts and sulphuric acid have been applied and the brown spots removed. Will this treatment permanently cure the spots or will they appear again? Are the brown spots due to quarry sap?"

One would require to inspect the stones in question before being able to express a definite opinion as to the cause of the brown spots referred to. Although sometimes caused by iron or quarry sap in the stone, they are more frequently the result of the application of such chemicals as you name. When the work is completed and cleaned down it is unfortunately a frequent practice to apply spirits of salts or other such acids to take out any dirty marks or stains (and often it is done during erection by workmen without one's knowledge). This it does temporarily, but the chemical eats into the stone and before long turns the stone browner than ever. We strongly condemn the use of any such chemicals being applied to any fine-axed grey granite.

Collar-Beam Truss.

LONDON.—AUTOLOCAS writes: "Please give me an idea of the necessary scantlings for a purlin roof as shown by sketch. I have called it a purlin roof, but doubt if a purlin is necessary if the wall above the collar is omitted and a ridge beam is substituted for the 7 × 1½ ridge. The gable walls are about 15ft. apart. The collar could be raised to make the room 9ft. 6ins. high, but I should wish to avoid this, if possible. Has any book on roofs been published—not merely king, queen and collar, but odds and ends of roofs such as above?"

The collar-beam truss submitted cannot be used as such on a span of 35ft. The simplest method of overcoming the difficulty will be to add purlins as shown in the sketch herewith. The gable walls being only 15ft. apart, 8in. by 4in. purlins may be fixed as shown, or they may be inclined if preferred. In either case it is desirable to notch the rafters slightly to prevent slipping. I know of no book giving information upon such roofs as this.



HENRY ADAMS.

Sundials.

HAMMERSMITH. — STUDENT writes: "Please give the setting-out for a sundial in a horizontal position."

Spackman's "History of the Sundial" (Batsford, 6s. 6d. nett), may be consulted; also Gatty's "Book of Sundials" (Batsford, £1 11s. 6d. nett).

HENRY ADAMS.

Journal for Brickmaking Industry.

EASTBOURNE.—O. writes: "Is there a special journal devoted to the brickmaking industry?"

Yes, the *British Clayworker*, Essex Street, Strand, W.C.

Obituary.

Mr. John Fyfe, the well-known Aberdeenshire granite merchant, died suddenly at his residence in Aberdeen on Wednesday last. Mr. Fyfe carried on one of the largest businesses in the granite industry in the kingdom, and his name was associated with some of the most important works that have been carried out in this country during the past quarter of a century. He supplied materials for Kew, Putney and the Tower Bridges, and many other large undertakings.

Our Plates

Two Newcastle Buildings.

We illustrate in this issue two buildings at Newcastle-on-Tyne opened by His Majesty the King recently—the Nurses' Home at the Royal Infirmary and the Armstrong College extension. A detailed description of each was given on page 6 of our issue for July 4th. The infirmary, we may say, has cost about £250,000, and provides accommodation for 420 in-patients, with a waiting hall in the out-patients' department for 400. The new wing to the Armstrong College completes this building. It has a front of about 100ft. to the Castle Leazes, with a central tower 120ft. high to the parapet. Behind is the examination hall.

Complete List of Contracts Open.

WITH a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

July 26. London, N.E.—*Erection of a cen'ral library building* in Mare Street, Hackney. Plans and specifications may be seen and bills of quantities, with conditions, form of tender and form of contract may be obtained at the offices of the architect, H. A. Crouch, A.R.I.B.A., 12 Gray's Inn Square, W.C., on payment of £1 1s. Tenders, sealed and endorsed "Tenders for Central Library Buildings," to be deposited with W. A. Williams, town clerk, Town Hall, Hackney, not later than 5 p.m. on July 26.

July 26. Nantymoel.—*Erection of new stables, carthouse, yard, and boundary walls*, also new butcher's shop, and conversion of existing stables into shoemaker's shop at Nantymoel, near Bridgend, for the Co-operative Society. Plans and specifications may be seen at the Co-operative Stores, where forms of tender and bills of quantities can be obtained upon a deposit of £1 1s. Sealed and endorsed tenders to be sent to the secretary, Mr. John Morgan, Co-operative Society, Nantymoel, not later than July 26.

July 26. York.—*Extending the destructor buildings*, Foss Islands Depôt. Specification and bill of quantities may be obtained of A. Creer, architect, Guildhall, York, on deposit of £1 1s. Tenders, endorsed "Destructor Buildings," to be delivered not later than noon on July 26.

July 26. Minehead.—*Erection of three houses aud Garage*, in the Parks, Minehead, for J. K. Heard, Taunton. Sealed tenders to be left with W. J. Tamlyn, architect, Minehead, not later than July 26. For plans and further particulars apply to W. J. Tamlyn.

July 27. Orton.—*Erection of ante-room* to Inchberry Public Hall, Orton. Plans and specifications may be seen with A. B. Hunter, chairman of Inchberry Hall Committee, Orton Station, with whom offers, endorsed "Ante-Room," may be lodged on or before July 27.

July 27. New Byth.—*Mason, Carpenter and Slater Works of erecting a new barn and stable* at Backhill of Auchnagorth (Cassie), New Byth. Plans, specifications and general conditions can be seen at the farm; or with Davidson & Garden, 12 Dee Street, Aberdeen, with whom offers are to be lodged not later than July 27.

July 27. London, S.E.—*Erection of a branch library* in London Street, West Greenwich, according to the drawings, specification, and conditions of contract and bond, which may be seen at the office of Wills & Anderson, architects, 24, Bloomsbury Square, London, W.C., between the hours of 10 and 12 on July 18, 19, and 20, 1906. Bill of quantities, prepared by Fowler & Hugman, F.R.S.I., may be obtained of the town clerk, Town Hall, Greenwich, upon payment of a deposit of £2 2s. The tenders, on the form supplied, sealed and endorsed "Tender for Branch Library," must be delivered to the Town Clerk, not later than 12 o'clock noon on July 27, 1906. Fair wages clause.

July 28. St. Annes-on-the-Sea.—*Technical School* at St. Annes-on-the-Sea, for the Urban District Council. Plans may be seen and bills of quantities obtained from the office of the county architect, Henry Littler, 16, Ribblesdale-place, Preston, by payment of a deposit of £2. Sealed tenders, endorsed "Technical School," must be sent so as to reach T. Bradley, Public Offices, St. Annes-on-the-Sea, not later than 12 o'clock noon on July 28.

July 28. Pontycymmer.—*Erection of a school hall* at Pontycymmer, for the English Calvinistic Methodist Church. Plans and specifications may be seen with Owen Jones, Saddler, Pontycymmer, or A. L. Thomas, architect and engineer, Church Street Chambers, Pontypridd. Sealed and endorsed tenders to be sent to Owen Jones on or before July 28.

July 28. Exeter.—*Erection of an elementary school for girls and infants* in St. James's Road, Exeter, in accordance with drawings and specifications which may be seen at the offices of James Jerman, F.R.I.B.A., architect and surveyor, Bedford Circus, Exeter, for the City Council. Bills of quantities may be obtained on payment of the sum of £1 1s. Tenders endorsed "Tender for St. James's School," to be sent to H. L. Parry, town clerk, Exeter, on or before July 28.

July 28. Penygraig.—*Building a vicarage* at Penygraig for the Rev. T. E. Griffiths. The plans and specification can be seen and quantities obtained of E. M. B. Vaughan, architect, Cardiff, on receipt of £2 2s. The tenders are to be delivered at the architect's office on or before noon on July 28.

July 28. Mynyddislwyn.—*Restoring and repairing the parish church* of Mynyddislwyn, near Abercarn, for the Rev. J. Jones Lewis. The plans and specification can be seen and quantities obtained of E. M. B. Vaughan, architect, 21, Dumfries Place, Cardiff, on receipt of £2 2s. The tenders are to be delivered at the architect's office on or before noon on July 28.

July 28. Irvine.—*Timber Beacon at the entrance to Irvine Harbour*, for the harbour trustees. Drawings and specification can be seen at the Harbour Office, Irvine; sealed offers, marked "Offer for Beacon," to be lodged with J. Norval Murray, Council Chambers, Irvine, not later than Saturday, July 28. The contractor can have the use of a barge and steam piling ram at a rate to be arranged.

July 28. Penzance.—*Villa residence*, at Lescudjack, Penzance. The plans and specifications may be seen of O. Caldwell, F.R.I.B.A., Victoria Square, Penzance; sealed tenders, endorsed "Tenders for Villa," to be sent to O. Caldwell on or before July 28.

July 29. Youghall—*Erection of nine houses* for the accommodation of the working classes, on Cork Hill, including the drainage, water supply, fencing and roadway, according to plan and specification (amended in red ink by the town surveyor), which can be seen at the town hall between the hours of 11 a.m. and 4 p.m., for the Urban District Council. Each tender must be accompanied by a schedule giving the quantities and prices upon which said tender in founded. Contractors must examine the site before tendering, as no extras will be allowed under any circumstance. Each tender is to be on the prescribed form (to be obtained from J. J. O'Shea, clerk, Urban District Council, Town Hall, Youghal), and is to contain the genuine signatures of two solvent persons willing to enter into a joint and several bond for the due execution of said works within the time specified. This bond and contract is to be prepared by the Council's Law Adviser and paid for by the contractor. Tenders, endorsed "Tender for the Housing of the Working Classes," addressed to the Chairman, Town Hall, to be sent through the Post Office not later than July 29.

July 30. Pontardulais.—*Three new shops, altering present shop, and erecting new offices* at Pontardulais. Plans and specifications may be seen at the offices of Williams & Henton, Bank Chambers, Heathfield Street, Swansea. Endorsed tenders to be sent to W. McWilliams, Bank House, Pontardulais, not later than July 30.

July 30. Sunderland.—*Additions, comprising Class Rooms, &c.*, to the West Boldon Wesleyan Chapel. Plans may be seen and quantities obtained on application to the Architects, 20, Fawcett Street, Sunderland. Tenders will be received up to 12 o'clock noon on July 30.

July 30. Fetteresso.—*Restoration of the farm steading destroyed by fire, and of a proposed new bothy at the farm of Blairs, Fetteresso.* The plans may be seen with G. Gregory, architect, David Street, Stonehaven, from whom schedules ofquantities may be obtained, and who will meet intending contractors at the farm; offers to be lodged with A. W. Kinner, solicitor, Stonehaven, on or before July 30.

July 30. Leeds.—*Building of additional Storeys to Warehouse Premises* in Skinner Lane, Leeds, also for brick-setting No. 1 Lancashire boiler. Intending contractors must forward their names to T. Winn & Sons, Architects, 84, Albion Street, Leeds, on or before July 30, when bills of quantities will be duly forwarded.

July 30. Warrington.—*A light telescopic ladder tower* for emergency work for the Electricity and Tramways Committee. Particulars and specification can be obtained on application to F. V. L. Mathias, A.M.I.E.E., Borough Electrical and Tramways Engineer, Howley, Warrington. Tenders must be sealed with wax, endorsed "Tender for Telescopic Ladder," and delivered not later than 12 o'clock noon on July 30, 1906, addressed to the Chairman of the Electricity and Tramways Committee, Town Hall, Warrington.

July 30. Glasgow.—*Sponge cloth laundry* at St. Rollox Stores. The drawings may be seen at the office of the company's engineer, Buchanan Street Station, Glasgow, where copies of the specification and schedule may be obtained on payment of £2 2s. Sealed tenders, endorsed "Tender for Construction of Sponge Cloth Laundry at St. Rollox," to be lodged with J. Blackburn, secretary, Caledonian Railway Company's Offices, 302, Buchanan Street, Glasgow, on or before July 30.

July 31. Whitehaven.—*Alterations and additions to the Old Infirmary* at the Workhouse, Whitehaven, for the Guardians. Drawings, specifications and conditions of contract may be inspected at the office of George Boyd, C.E., 33, Queen Street, Whitehaven, from whom form of tender and schedule of quantities may be obtained on payment of 5s. Sealed tenders, endorsed for "Tender for Workhouse Alterations," will be received by W. H. Atkinson, clerk, Union Hall, Whitehaven, up to noon on July 31.

July 31. Gosforth.—*Taking down and setting back the boundary wall of the South Gosforth Council School, Station Road: undersetting the north wall of the school building, and forming the added width of roadway.* All particulars may be obtained from G. Nelson, engineer and surveyor to the Council, Council Chambers, High Street, to whom application should be made for quantities. Tenders, endorsed "Road Widening, &c., South Gosforth Council School," to be sent to R. S. Holmes, Council Chambers, Gosforth, not later than July 31.

July 31. Derby.—*Enlargement of the branch post office* at Midland Road, Derby. Drawings, specification, and a copy of the conditions and form of contract may be seen on application at the Midland Road Branch Post Office, Derby, between the hours of 10 a.m. and 4 p.m. Bills of quantities and forms of tender may be obtained of the Secretary, H.M. Office of Works, Storey's Gate, London, S.W., on payment of £1 1s. Tenders must be delivered before 12 o'clock noon on July 31, addressed to the Secretary, H.M. Office of Works, &c., Storey's Gate, London, S.W., and endorsed "Tender for Derby Branch Post Office Enlargement."

July 31. West Hartlepool.—*Construction of steps* leading from the Longhill subway to the proposed road, in accordance with plans, sections, and specification to be seen, and approximate quantities obtained of N. F. Dennis, Borough engineer and surveyor, Municipal Buildings. Tenders, endorsed "Construction of Steps, Longhill Subway," and addressed to the Chairman of the Works Committee, are to be delivered at the office of the Town Clerk, 78, Church Street, not later than 4 p.m., on July 31.

July 31. Wolverhampton.—*Erection of additions to the administrative block* at the fever hospital in Green Lane. Plans may be seen, and specifications, bill of quantities, and form of tender obtained on application to G. Green, Borough engineer, Town Hall, Wolverhampton, upon payment of a deposit of £1 1s. Tenders, addressed to the chairman of the Health Committee, to be delivered at the Town Clerk's Office by 10 a.m. on Tuesday, July 31. (Fair wages clause.)

July 31. Rothwell Haigh.—*Erection of an engine-house and pump-room* at their new workhouse, Rothwell, Haigh, in accordance with the drawings and specifications prepared by W. E. Richardson, architect, Rothwell, near Leeds. Applications for bills of quantities and forms of tender must be made to the architect on or before July 21, and bills of quantities will be supplied to such applicants only. Drawings may be inspected at the offices of the architect, and tenders, on forms provided, must be delivered to F. W. Mee, Union Offices, Hunslet, Leeds, by 10 o'clock on Tuesday, July 31.

August 1. Slapton.—*Erection of a Vicarage House* at Slapton. Plans and specifications can be seen on application to Mrs. Bowles, Carr Lane, Slapton, between the hours of 10 and 4 o'clock, or at the office of W. F. Tollit, architect, 10, High Street, Totnes, from whom any further particulars can be obtained. Tenders are to be sent to Oldrieve and Hingston, Bridgetown, Totnes, on or before August 1.

August 1. London, W.—*Erection of Workshops* at the Workhouse in the Harrow Road, W., pursuant to plans and specification to be seen at Messrs, Giles, Gough & Trollope, architects, 27 Craven St,. Strand W.C., between the hours of 10 and 5, where all necessary information can be obtained and also form of tender. Bills of quantities may also be obtained at the Offices of the said architects, on payment of a deposit of £5 5s. Fair wages clause. Sealed tenders must be delivered to H. F. Aveling, 313-319, Harrow Road, W., before 10 o'clock a.m. on August 1.

August 1. Nottingham.—*New Baptist Mission Hall*, Robin Hood's Chase, Nottingham. Plans and specification may be seen with Mr. Phillimore, 114, Alfreton Street, Nottingham, and at the offices of W. Burns Rees, architect, 3, Dumfries Place, Cardiff, from whom bills of quantities may be obtained. Tenders are to be sent to the Hon. Pastor, W. A. Coombs, Roseholme, Clumber Avenue, Mapperley Plains, Nottingham, on or before August 1.

Aug. 1. Pontypridd.—*Erection of a large chapel and schoolroom* for the English Baptist Church at Hopkinstown, Pontypridd. Plans and specifications may be seen of A. L. Thomas, A.M.I.C.E., architect and engineer, Church Street Chambers, Pontypridd. Sealed and endorsed tenders to be sent to the Rev. Samuel Davies, Oakfield, Pwllgwaun, Pontypridd, on or before Aug. 1.

Aug. 2. Alnwick.—*Erection of new residence* at Alnwick for Wm. Percy, Esq. The plans and specifications may be seen of G. Reavell, Junr., Alnwick, and the tenders, duly endorsed, must reach him not later than noon, August 2.

August 3. Ton Mawr.—*Erection of stables at the railway inn*, Ton Mawr, near Pontrhydyfen. Plans and specifications can be seen at the railway inn or of T. Roderick, architect, Ashbrooke House, Aberdare, where bills of quantities can be obtained. Endorsed tenders to be sent in to the architect not later than August 3.

August 4. Roseudian.—*Cattle house at Roseudian*, in the parish of St. Hilary, in the occupation of Mr. Benjamin Hocking and the executors of Mr. William Hocking. Plans, conditions and specifications, which are now at the farmhouse at Roseudian, can be inspected; tenders should be sent, on or before August 4, to G. Gow, Tregothnan Office, Truro.

August 4. Hayle.—*Stable buildings, &c.*, at Hallankean, Hale, in the occupation of J. H. Richards, where the plans and specifications may be seen. Tenders to be sent to S. Lawrey, Helnoweth Gulval, August 4.

August 4. Wakefield.—*Works in connection with alterations to Wales Kiveton Park Provided School.* Plans may be seen and quantities obtained on application to J. Vickers-Edwards, county architect. A deposit of £1 is required. Cheques to be sent to the West Riding Treasurer, County Hall, Wakefield. Sealed tenders, properly endorsed, to be sent to J. Vickers-Edwards, county architect, County Hall, Wakefield, not later than 10.30 on the morning of August 4.

August 6. Dumfries.—*Pavilions at the Crichton Royal Institution, Dumfries.* Plans and specifications, &c., can be seen at the Crichton Royal Institution, Dumfries. The Clerk of Works will be in attendance at the institution on July 25, 26, and 27, to give explanations or information necessary. Tenders must be lodged with S. Mitchell & Wilson, 13, Young Street, Edinburgh, on or before August 6.

August 6. Riverside, Radstock.—*Re-construction of existing buildings as business premises*, comprising a draper's shop, furniture store, &c., at Riverside, Radstock, for the Radstock Co-operative Society, Ltd. Plans and specification may be seen by appointment with W. F. Bird, architect, Midsomer Norton, and bills of quantities and form of tender will be forwarded in order of application. Persons desirous of tendering must send their names to the architect not later than July 25, and sealed tenders, endorsed "Proposed Premises, Riverside," are to be delivered to the secretary of the society on or before August 6.

August 7. Cradley—*Erection of a corrugated iron goods shed, offices, &c.*, on the Spinners End Goods Branch, Cradley, for the Directors of the Great Western Railway Company. Plans and specification may be seen and forms of tender and bills of quantities obtained at the office of the Engineer at Wolverhampton Station, between the hours of 10 a.m. and 4 p.m. Tenders addressed to G. K. Mills, Secretary, Paddington Station, London, W., and marked outside "Tender for Goods Shed, etc., Cradley," will be received on or before August 7.

August 15. Lostock Hall, near Preston.—*Erection of a new Public Elementary School* at Lostock Hall, near Preston. The plans may be seen and bills of quantities obtained at the office of Henry Littler, county architect, 16, Ribblesdale Place, Preston, by payment of a deposit of £2. Tenders must be delivered before 12 o'clock noon on August 15, 1906, sealed and endorsed, to W. S. Woodcock, Council Offices, Bamber Bridge, near Preston.

August 16. Antwerp.—*Reconstruction of the Government Bonded Warehouses*, known as the "Nord-Ancien and Nord-Nouveau." The specification ("*Cahier des charges*," No 1,144), relating to the contract may be obtained from the Hôtel de Ville, Antwerp, at a cost of 2 francs. All tenders should be sent in sealed registered envelopes, addressed "A Monsieur le Bourgmestre en l'Hôtel de Ville d'Anvers," and should reach the Hôtel de Ville not later than August 16. A deposit of £1,000 is required to qualify any tender. A copy of the specification may be seen at the offices of the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

August 21. Sheffield.—*Underground conveniences adjoining the town hall in Surrey Street* for the Health Committee. Specification and plans may be seen and quantities obtained at the office of C. F. Wike, C.E., city surveyor, Town Hall, Sheffield, on payment of £1 1s. Tenders, endorsed "Town Hall Conveniences," are to be sent in not later than 6 p.m. on August 21, addressed to "The Chairman and Members of the Health Committee, City Surveyor's office, Town Hall, Sheffield." A fair wages clause.

No Date. Ballymena.—*A 60-feet brick chimney* at Ahoghill Creamery, Ballymena. Plans and specifications can be seen at Creamery.

No Date. London, E.—*Erection of a boundary wall* on the Workhouse premises in Bancroft Road, E., for the Mile End Old Town Board of Guardians. Forms of tender and full particulars relating to the work can be had upon application at the offices of J. M. Knight, architect, 35, Bancroft Road, Mile End, E. Fair wages clause.

No date. Coleford, Gloucester.—*Erection of a Doctor's Residence* at Coleford, in the County of Gloucester, for Dr. J. Rowland Payne. Intending contractors are requested to forthwith send in their names to E. G. Davies, M.S.A., architect, 7, Bridge Street, Hereford, and at Monmouth, when plans, specification, and form of tender will be supplied.

ENGINEERING.

July 27. Sunderland.—(*a*) *Two 250-kw. synchronous motor generators, 5000—240 volts.* (*b*) *High tension and low tension switchgear for the electricity department.* The specifications and forms of tender can be obtained on application to the Borough Electrical Engineer, J. F. C. Snell, M.Inst.C.E., Town Hall, Sunderland, and on payment of a deposit of £1 1s. for each specification. Sealed tenders addressed to the "Chairman of the Electricity and Lighting Committee," Town Hall, Sunderland, must be delivered to F. M. Bowey, Town Hall, Sunderland, not later than 12 o'clock noon on July 27. Tenders to be endorsed "A" or "B" according to the item tendered for.

July 30. Stanley and West Hallam.—*Waterworks at Stanley and West Hallam*, Derbyshire, including laying 4,466 yards of 6in., 3,050 yards of 4in., and 1,910 yards of 3in. cast iron pipes, with all appurtenances, and the construction of a brick service reservoir (capacity 90,000 gallons). Copies of the specification and quantities, including conditions and form of tender, and also forms of contract can be obtained, and the general and detail drawings seen, at the office of S. E. Burgess, M.Inst.C.E., borough engineer and surveyor, Chapter Row, from whom all further information may be obtained. Tenders, on forms supplied, sealed and endorsed "Tender for Tramways Permanent Way, Boldon Lane Extension," must be delivered to J. M. Hayton, Court Buildings, South Shields, on or before 12 noon, on August 11.

SANITARY.

July 26. Bradford-on-Avon. — *Supply and fixing of sixteen 38ft. diameter revolving sewage distributors at their sewage disposal works*, Bradford-on-Avon; also for the supply of valves and fittings. A copy of the conditions and specification and forms of tender can be obtained of A. S. Wootton, Council's surveyor, Town Hall Chambers, Bradford-on Avon, upon payment of a deposit of £1 1s. Sealed tenders, upon prescribed forms, marked outside "Tender for Sewage Distributors," or "Tender for Valves, &c.," as the case may be, must be delivered or sent to E. Pinckney, J.P., South Wraxall, Bradford-on-Avon, not later than midday, July 26,

July 27. Dunham Massey.—*Construction of the following works of sewerage*, within the township of Dunham Massey:—1,170 lineal yards or thereabouts of 18-inch diameter stoneware pipe and concrete sewer between Lowerhouses and Broadheath; 80 lineal yards or thereabouts of 15-inch diameter stoneware pipe and concrete sewer, and 36 lineal yards or thereaaouts of 15-inch diameter cast-iron pipe and concrete sewer under the railway at the cattle bridge, 500 yards or thereabouts west of the Broadheath station on the L. & N.W. railway, together with all shafts, manholes, and other appurtenant works in connection therewith for the Bucklow Rural District Council. Plans, sections, detail drawings, and specification can be seen, and bill of quantities with form of tender and any other information obtained on application to J. P. Wilkinson, M.Inst.C.E., 301, Cathedral Street, Manchester, and on deposit of the sum of £2 2s. Sealed tenders, endorsed "Dunham Massey Sewerage, Contract No. 4," must be addressed and delivered to G. Leigh, clerk to the Urban District Council, Union Offices, Knutsford, Cheshire, not later than 10 o'clock a.m., on July 27, 1906.

July 30. Chadderton.—*Construction of earthenware and cast-iron pipe sewers*, &c., for the sewerage of the Middleton Junction District. Drawings and specifications may be seen, and quantities, Form of tender, and all other particulars obtained, on application at the offices of James Diggle & Son, civil engineers, Hind Hill Street, Heywood, and 14, Victoria Street, Westminster, S.W., on payment of a sum of £3. Tenders, endorsed "Tenders for Middleton Junction Sewerage, Contract No. 14," to be sent to H. Hoyle, clerk to the Council, Town Hall, Chadderton, not later than July 30.

July 31. Durban (Natal).—*Supply and delivery, "free on board," of two miles, 6in. diameter, one mile 7in. diameter, and two miles 8in. diameter, stoneware sewerage pipes.* Specifications can be obtained from W. H. Radford, C.E., Albion Chambers, Nottingham, consulting and representative engineer to the Corporation, on deposit of £1 1s. Sealed and endorsed tenders must be delivered to Webster, Steel & Co., agents to the Durban Corporation, 5, East India Avenue, Leadenhall Street, E.C., on or before July 31.

August 1. Erdington.—*Sewering and making a new road* (about 445 yards lineal) at Erdington, near Birmingham. Plans and specifications may be inspected, and bills of quantities and form of tender obtained on depositing the sum of £2 with W. Parrott & Antrobus, surveyors, 19, Colmore Row, Birmingham. Sealed tenders, endorsed "Tender for New Road at Erdlington," to be sent to the surveyors not later than August 1.

August 1. Linton.—*Provision, laying and jointing about 1,800 yards of 9in. stoneware pipe sewers*, together with all manholes and lampholes, the construction of a small sewage tank, laying out irrigation area, and other works in accordance with the plans, sections, detail drawings, and specification prepared by the engineers for the Repton Rural District Council. Plans and specifications may be seen, and bills of quantities obtained, of Willcox & Raikes, engineers, 63, Temple Row, Birmingham, on payment of a deposit of £3 3s. Sealed tenders in envelopes supplied endorsed "Linton Sewerage, Contract No. 3," to be delivered to C. F. Chamberlain, clerk to the Council, Union Offices, Burton-on-Trent, not later than 12 noon on August 1.

August 8. Portsmouth.—*Construction of sewers, manholes, pumping station, attendant's cottage and all accessories* in Copnor Road, in the borough of Portsmouth, together with Crossley's gas engines and centrifugal pumps. On payment of the sum of £5, a lithographed copy of the specification, general conditions, and bill of quantities, together with form of tender, can be obtained on application to A. Hellard, town clerk, Town Hall, Portsmouth, and any further particulars can be obtained at the Borough Engineer's office, at the Town Hall, Portsmouth. Tenders, marked "Tender for Copnal Road Sewer and Pumping Station," must be filled up, signed and returned, with the bill of quantities duly filled in, to the Town Clerk, not later than 10 a.m., on August 8. Fair wages clause.

August 14. Spain.—*Execution of drainage works*, in accordance with conditions set forth in the "Gaceta," at the upset price of 102,907 pesetas (about £3,690). A deposit of 5,145 pesetas (about £184) is required to qualify any tender. Tenders will be opened on August 14 at the "Casa Consistorial, 5 Plaza de la Villa, Madrid."

MISCELLANEOUS.

Cudworth, company's engineer, at York, or district engineer, E. Smith, at Paragon Station, Hull, where detailed quantities and form of tender may be obtained on personal application. Sealed tenders, marked "Tender for Signal Cabin at Dairycoates," to be sent to the engineer, J. W. Cudworth, at York, not later than July 30.

August 3. Withernwick.—*Additions and alterations to the offices, &c., at the Council School, Withernwick.* Persons desirous of tendering for the work may see the drawings, specification, and obtain forms of tender on application to the Building Surveyor, County Hall, Beverley, or at the above school during the usual hours. Tenders, endorsed "Withernwick School," to be forwarded not later than August 3, to J. Bickersteth, clerk to the East Riding Education Authority, County Hall, Beverley.

July 28. Mountmellick.—*Erection of labourers' cottages and fencing plots of same* for the R.D.C.—namely, 1 Cottage in Townland of Kilmainham in the electoral division of Shaen. 1 Cottage in Townland of Tinnakill in the electoral division of Coolrain. Tenders to be considered on July 28. For further particulars see placards, which can be had on application to R. Goodbody, clerk of the council, District Council Office, Mountmellick.

SOCIETY OF ARCHITECTS' DINNER.

The Twenty-second Annual Dinner of the Society of Architects was held on Thursday last at De Keyser's Royal Hotel, Victoria Embankment, London, E.C., the president (Mr. Albert E. Pridmore), occupying the chair. Among those present were:—

Sir T. Vansittart Bowater, Sheriff; Alexander Ritchie, J.P., Chairman of the City Lands Committee; Alderman Sir Henry E. Knight, past Lord Mayor; Alderman Sir Horatio Davies; Mr. S. W. Perks, City Surveyor; Mr. C. Welch, City Librarian; Masters of the Worshipful Companies of Tylers and Bricklayers, Painters, and Carpenters; Mr. James Bell, Town Clerk; Mr F. Sumner, City Engineer; Sir T. Brooke Hitching; Archdeacon Sinclair; Very Rev. Dean Vere; Mr. G. L. Gomme, Clerk, London County Council; Mr. W. E. Riley, Architect, London County Council; Mr. L. A. Atherley-Jones, K.C., M.P., Mr. T. B. Silcock, M.P., Mr. H. Greville Montgomery, M.P., Mr. J. S. Fletcher, M.P., Mr. Donald Maclean, M.P., Mr. W. C. Lorden, President of the Master Builders' Association; Mr. E. Dru Drury, F.R.I.B.A., President District Surveyors' Association; Mr. Edward Holmes, President Sheffield Society of Architects; Mr. Thomas Cooper, F.R.I.B.A., President Birmingham Architectural Association; Mr. James M. Monro, F.R.I.B A., President Glasgow Institute of Architects; Mr. R. G. Wilson, A.R.I.B.A., President Aberdeen Society of Architects; Mr. Harold O. Tarbolton, F.R.I.B.A., President Edinburgh Architectural Association; Mr. E. O. Sachs, Chairman British Fire Prevention Committee; The Lord Mayor of Dublin, and the Mayors of Finsbury, Fulham, Holborn, and Stoke Newington; Mr. A. C. Scovell, J.P., Chairman Metropolitan Asylums Board; Sir R. Melville Beachcroft, Chairman Metropolitan Water Board, and the Consul-General of Japan.

After the loyal toasts had been given by the president, Mr. Alexander Ritchie, J.P., proposed the toast of "The Houses of Parliament," which was responded to by Lord Stanley of Alderley and the Right Hon. James Bryce, M.P., Chief Secretary for Ireland, the latter, referring to the fact that the Victorian era had produced no definite school of architecture. In the cities, he feared, too much had been left to chance, the whole aspect of the streets having been spoilt for reasons which could have been avoided if street building had been carried on under the management of a competent body. The Government and local authorities were now alive to the importance of the matter, and he trusted that there would grow up a twentieth-century style of architecture the merits of which would be appreciated by posterity.

The next toast, that of "The London Local Authorities," was proposed by Mr. R. Frank Vallance, F.R.I.B.A., vice-president, and Mr. Deputy Wallace, replying for the City, said he hoped the services of the gentlemen present would be asked for in connection with the widening of Blackfriars Bridge for the extension of the tramway system of the London County Council. The Mayor of Holborn also replied.

The toast of the evening, "The Society of Architects," was proposed by Lord Monkswell, and the President, in response, said that the history of the Society, which had now existed for 22 years, was the history of the movement in favour of the Statutory Registration of Architects. They had to thank Lord Monkswell for introducing the Bill on previous occasions. The Society had not advanced by leaps and bounds, but had made steady progress, and now had a membership of over 800. Early in the year they instituted a Travelling Studentship which attracted a large number of entries, and resulted in many excellent designs being submitted. During the year the Council have instituted a Distributing Library. This was most valuable for provincial members, who could have the books sent them by post. Their membership was not limited to the United Kingdom, and recently branches had been established in India and Africa.

The toast of "Our Visitors," which was proposed by Mr. G. A. T. Middleton, A.R.I.B.A., vice-president, was responded to by Judge Rentoul and Mr. Thomas Cooper, F.R.I.B.A., president of the Birmingham Architectural Association.

ARCHITECTS' JUNIOR ASSISTANT, age 21, requires situation; good general experience in provincial office. Reference and specimen. Box 1968, Builders' Journal Office, 6, Great New Street, E.C.

ARCHITECT'S Reliable ASSISTANT Disengaged; 7 years' experience; good draughtsmanship, design and quantities; excellent testimonials; salary 25s. per week.—Apply Box 1987, Builder's Journal Office, 6 Great New Street, Fetter Lane, E.C.

BRICKLAYER wants Job, Foreman or Working, town or country; good reference; age 30; sober and punctual.—B. A. W., 40, Mansfield Road, Walthamstow. 1962

BUILDER'S ASSISTANT or estate clerk of works; life experience; age 30; 4 years in present situation (Admiralty); quantities, estimating, plans, &c.; good organiser and manager of men; references.—344, Canterbury Road, Gillingham, Kent. 1975

BUILDER AND CONTRACTOR'S ASSISTANT (28), 12 years' experience, last seven with large London firm; efficient in prime cost and all departments; excellent references.—Box 1989, Builders' Journal Office, 6, Great New Street, Fetter Lane E.C.

BUILDER'S CLERK (31), estimating, quantities, plans, specifications, measuring, accounts, P.C., &c.; 15 years' sound London experience with McCormick's and others, also Works Department, L.C.C.; salary moderate.—E.J.O, Spring Villa, Binfield, Berks. 1981

DECORATIVE SALESMAN OR MANAGER (age 46) seeks engagement; good West-end experience in estimating and superintending; highest references.—Address B. A., 16, St. Michael's Road, Stockwell, S.W. 1955

DRAUGHTSMEN–Good general experience Working drawings and details. Perspectives in colour, attractive sketches, &c. Measuring and plotting. Quick, accurate and artistic. Moderate salary.—Y, 2, Beresford Road, Highbury. 1961

DRAWINGS from rough sketches, designs, details, specifications, drain plans and quantities prepared; terms moderate.—J. W., 8, Rylett Crescent, Shepherd's Bush, W. 1967

FOREMAN CARPENTER or GENERAL FOREMAN, good man, experienced large jobs and good-class work, and as Shop Foreman, wants job, anywhere.—G. R. Briarfield, Carlton Avenue, Prittlewell, Southend. 1990

FOREMAN PAINTER (Working), age 36, seeks Re-engagement or Piecework. Last reference eight years with big firm; used to contract work.—J. A., 88, Beryl Road, Hammersmith, W. 1982

GENERAL FOREMAN DISENGAGED; thoroughly capable and experienced in all trades; good manager and timekeeper; town or suburbs; carpenter and joiner; good references, 47—Foreman, 30 Bolton Road, West Ham, E. 1988

GENERAL FOREMAN (45), Life experience new and alterations; 16 years with present employer; largest in Eastern counties; seeks re-engagement; good manager of men; highest possible architects', engineers' and builders' references.—Box 1965, Builders' Journal Office, 6, Great New Street, London, E.C.

GENTLEMAN, good appearance and address; nine years' experience in building trade; desires engagement as TRAVELLER in Kent and Sussex to good firm.—F. J. L., 53, Maidstone Road, Chatham. 1957

HEAD or WALKING FOREMAN DECORATOR wants situation; thoroughly practical in all branches; over twenty years' West End work; arabesque, painter, gilder, &c.; highest references.—W. Hatherley, 13, Grove Cottages, Manor Street, King's Road, S.W. 1974

MACHINIST (24) wants JOB; good experience; overhand thickness, circular bandsaw, etc.; good reference; sharpen saws (gas engine).—W. Luff, 19, Ashdown Street, Queen's Crescent, Kentish Town, London, N.W. 1945

MACHINIST seeks CONSTANCY; all-round hand; 16 years' practical experience hard or soft woods; single-handed, cutter-making, saw-sharpening; come at once anywhere, Midlands preferred.—Ernest, 21, Sixth Avenue, Enfield. 1950

PART-TIME ASSISTANCE to Builders and Contractors in quantities, variations, estimates, drawings and accounts by practical builder's clerk.—C., 61, Sydenham Road North, Croydon. 1946

PLUMBER, well up in latest sanitary and lead laying, new or jobbing; can do H.-water if required; good refs.; town or country.—Moore, 95, Victor Road, College Park, London, N.W. 1979

QUANTITY SURVEYOR'S ASSISTANT open to re-engagement, temporary or permanent. Present employers fourteen years. Taking off and measuring up. Thoroughly experienced. Terms moderate.—Apply W. H. C., 18, Calabria Road, Highbury, London, N. 1966

SHOP FOREMAN of JOINERS seeks re-engagement; energetic, punctual, economical manager of men and machinery; has conducted trade shop; town or country.—Box 1948, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

STAIRS, Handrails, Iron Core Rails, and Balustrades TAKEN TO FIX complete.—T. Bradley, 64, Bellamy Street, Balham, S.W. 1960

TO ARCHITECTS.—QUANTITY SURVEYOR, 20 years' experience, is open to arrange with architects on moderate terms for the Preparation of Quantities, Adjustment of Variations, &c.—T. Kennedy, Q.S.A., 532, Caledonian Road, Holloway. N. 1972

TO BUILDERS & OTHERS.—Designs, working drawings, specifications, estimates prepared for all classes of work.—Box No. 1963, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

WANTED by an A.R.I.B.A., a position as Surveyor, Clerk of Works, Estate Agent, Steward, &c.; has had great experience in architecture and surveying: first-rate testimonials.—Apply Box 1944, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

WORKING SHOP FOREMAN of JOINERS seeks re-engagement; good manager of men and machinery; accurate setter-out; seven years' experience; abstainer. first-class references; age 32.—Apply J. E. Amos, 9 Martyr's Villas, Canterbury. 1956

YOUNG MAN used to GENERAL BUILDING WORK, seeks sit; moderate wages; distance no object.—J. James, 42, De Beauvoir Crescent, Southgate Road, London, N. 1980

Appointments Vacant.

ARTICLED PUPIL.—VACANCY for same in old-established London Architect and Surveyor's office—Box 1816, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

FIBROUS PLASTERING.—Steady energetic man, capable of taking entire charge of FACTORY about to be opened; applicants must have a long and up-to-date experience in above-named line.—Address, giving fullest particulars as to experience, references, salary, etc., Box 1952, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

JUNIOR CLERK WANTED in Builder's office; age about 16; must be methodical; one with knowledge of shorthand preferred; good opportunity for smart boy. Apply by letter, stating qualifications and experience.—M. & P., 165, Gray's Inn Road, W.C.

WANTED, EDUCATED YOUTH, 16–20, for Builder's Office; knowledge of correspondence, re-selling and letting houses (preferred); also shorthand and typewriting, but not essential; salary according to experience.—Write, in first instance, to Wastnage, 39, Briardale Gardens, Hampstead. 1958

Drawings, Tracings &c.

AN ARTIST and DRAUGHTSMAN is prepared to undertake Architectural Drawings or Designs for manufacturing firms, either in office or at home. Perspectives, Illuminated Addresses, &c.—E.S.B., Box 1813, Builders' Journal Office, 6 Great New Street, Fetter Lane, E.C.

ARCHITECTURAL ASSISTANCE.—DRAWINGS, TRACINGS, SURVEYS. PERSPECTIVES, &c., prepared at moderate charges. Photo copies.—C. Boswell, 52, Gray's Inn Road, W.C.

ASSISTANCE rendered in the preparation of Architectural Drawings, &c., at advertiser's own address.—Box 1717, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

PERSPECTIVES and DESIGNS expeditiously executed.—Lewis Mander, 83, Sandmere Road, Clapham, S.W. 1954

QUANTITIES AND SPECIFICATIONS ESTIMATES. (Nominal fee if unsuccessful.) Experienced General Assistance, Competitions, Designs, Contract, Detail, and Working Drawings.—Address, Quantity Surveyors, 21, Liverpool Street, E.C.

Miscellaneous.

"BUILDING NEWS" PLATES, selected, 9 vols. specially bound, under headings; also photos of human figure and ¼-plate Frena camera; accessories; cheap.—Apply Box 1984, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

FACTORY.—Splendid FREEHOLD SITE of 3 to 20 acres, adjoining navigable river, centre of market town, near railway; gas, water, and electric light available.—Ginn & Son, Luton Archway, Chatham.

SECOND-HAND OPTICAL MART for the Purchase and Sale of LEVELS, THEODOLITES, DRAWING INSTRS.—Clarkson's, 338, High Holborn, London, W.C. (opposite Gray's Inn Road).

TO TILE MAKERS.—REQUIRED quantity of plain Yorkshire TILES for tile creasing: delivered London station.—Turner & Sons, Goods Station, Shepherd's Bush.

THE BUILDERS' JOURNAL

AND ARCHITECTURAL ENGINEER.

July 25th, 1906.

CONTRACTORS' SUPPLEMENT (MONTHLY).

SPEED.

By James F. Parker,

Managing Director of Patman & Fotheringham, Ltd.

Speed in the construction of buildings is recognised as a very important factor in the building trade.

To manufacturers who are rebuilding or enlarging their factories the time taken by the builders in completing the work means a great deal, both financially and otherwise, and contractors with reputations for quick work hold a big advantage over their competitors in cases where time is the essence of the contract.

The work of preparing estimates is extremely important in these cases, and requires great care on the part of the estimator entrusted with the task of pricing the job. Apart from the everyday difficulties, requiring special experience and knowledge, he has to take into account the extra cost entailed by night work, and the many other items of expense incidental to hurried contracts.

It is often said that nothing of importance can be done without a system, and this applies with much force to the building trade, especially in regard to the quick execution of contracts. Good system, coupled with keen management and proper supervision, is essential in achieving the object aimed at. It is also absolutely necessary to have a good foreman, as so much depends on the man in charge of the job.

What Constitutes a "Good" Foreman ?

is a question that is often raised. In the first place, he must be well acquainted with the different branches which go to make up the building trade and have had a practical training and experience in one trade.

He must be "master" of the men under him, and able to get the best out of them—not necessarily by "driving" methods, but by firmness and tact. A weak man never earns the respect of the workmen under him, which is so important to the smooth running of a job, be it a quick one or not. Many would-be foremen have failed owing to the want of this faculty of managing men, although they may be good and efficient tradesmen. Many leading hands in the various trades are useless as general foremen, and cannot organize or direct and carry out the work unless under the personal supervision of a good foreman.

A good foreman always looks well ahead and orders materials, &c., well in advance, so that the job may not be kept waiting when the time comes for them to be fixed. In fact, a foreman must not put off till the morrow what he can do to-day.

In Dealing with the Difficulties

that naturally arise in building operations, a great amount of tact is required from the foreman, and in adjusting and putting these right, gives him the opportunity of proving his worth. The old saying that good masters make good workmen applies to foremen, for a good foreman can always command good workmen who can do a fair day's work. A slack foreman never gets the best out of the men under him, and therefore handicaps himself in consequence, as this incurs an increased amount spent in wages (on which most builders keep a sharp eye), and thus retards his future prospects of undertaking important contracts.

Opinions Differ

in the building trade as to whether a bricklayer or carpenter makes the best foreman, but this depends much on the man himself, though carpenters seem to be in the majority amongst foremen. In cases of large electric light works and contracts of a similar nature where the work is chiefly brickwork it naturally follows that a bricklayer foreman is usually more fitted to take charge.

American contractors made a big fuss some time ago about the large quantity of bricks laid by their men during the erection of the large building works in Manchester. I was glad to see their statements did not go unchallenged; for there are, without a doubt, bricklayers in London quite capable of competing with anyone as to speed and workmanship in laying bricks.

In erecting the electric light works at Marshgate Lane, Bow, we used some millions of bricks, and the accompanying illustrations give a slight idea of the size of the job—the condensing towers being rather conspicuous.

Night Work

is a large feature in cases where the time for executing large contracts is short.

It is naturally assumed that work is carried on with more difficulty during the night, as artificial light on large buildings is not altogether satisfactory, notwithstanding the aid of the recent acquisition to the trade of arc lamps and other improved means of lighting.

Accidents.

It seems strange that fewer accidents happen in night gangs than occur during the day. This is, no doubt, explained by the men being more careful, well knowing there is always more risk of a slip on his part than at any other time.

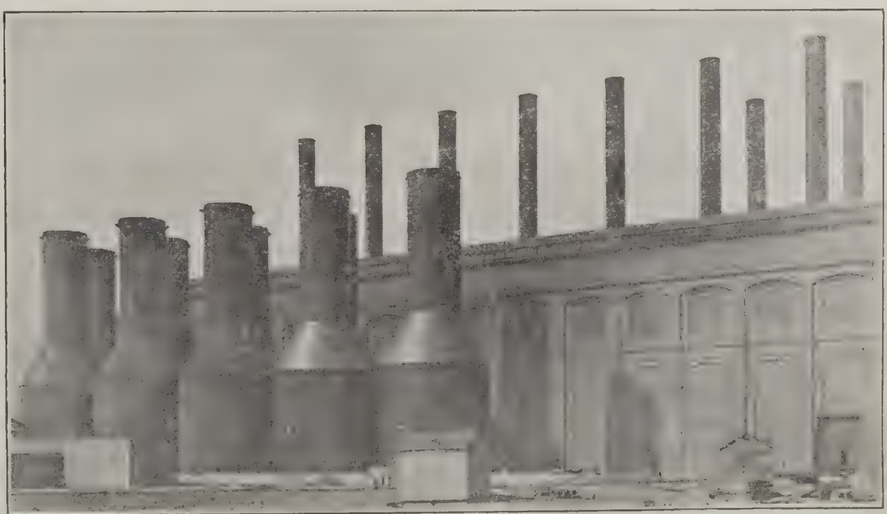
In carrying out the completion of the London Coliseum in seven months (we used over one and a-half million bricks) time was an all-important factor, and jobs of this size must necessarily be attended with difficulties which have to be surmounted, and can only be done with the aid of a large night gang, so that the work can proceed with all speed by night as well as by day.

Co-operation of Sub-Contractors.

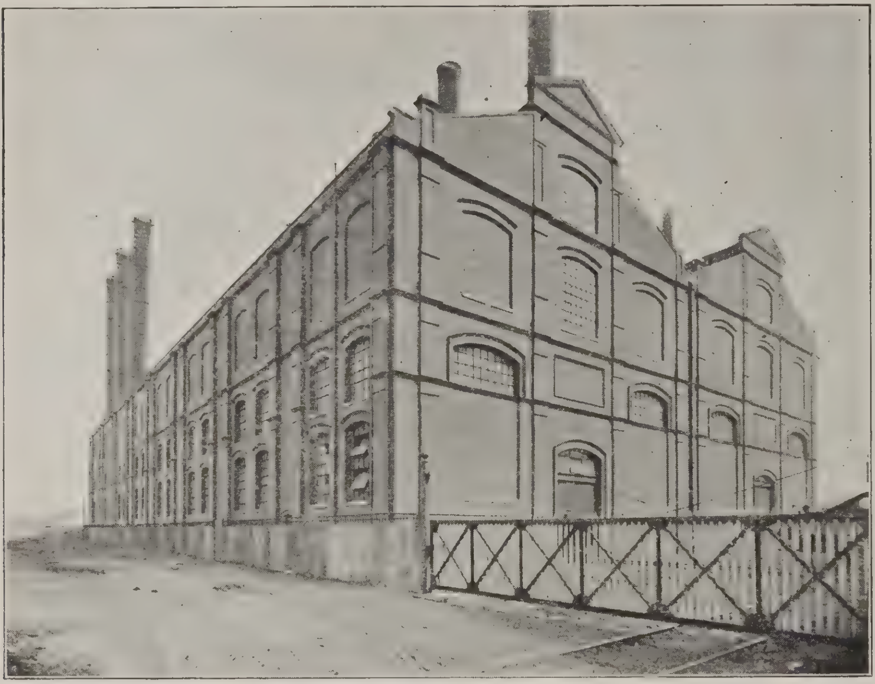
All builders know full well the trouble which arises from non-delivery at the proper date of this or that speciality which has or has not been specified. Nothing hampers and delays a job so much as this, and the co-operation of all the sub-contractors is, therefore, a *sine quâ non* in getting a job completed quickly.

Electric cranes and other modern time-saving appliances all do their part in the effort to get contracts done with such promptitude.

Last year the writer's firm were engaged by the Admiralty to erect the boy-artificers' workshops and the gunnery school for sub-lieutenants at Whale Island, and to illustrate the speed with which modern building operations could be carried out. This building has two storeys and is 256ft. long, 27ft. wide, and 34ft. high, with the cubical contents of 215,000ft. and comprises 100 rooms and requisite bath-rooms. The building was completed under most difficult and exceptional circumstances in the short space of six months from the commencement, and the writer's firm



ELECTRICITY GENERATING STATION, BOW, LONDON, E., FOR THE CHARING CROSS AND STRAND ELECTRICITY SUPPLY CO



ELECTRICITY GENERATING STATION, BOW, LONDON, E.

received the compliments of the Board of Admiralty upon the excellence of the work and the promptitude of its execution.

Party Wall Disputes

and questions of light and air are some of the chief difficulties builders have to contend with in their exertions to execute work within contract time. What builders have not had the annoying experience of having their building stopped for weeks owing to these questions? The recent decision in the Colls *v.* Home & Colonial Stores, has, I am glad to say, eased matters over as regards the rights of adjoining owners as to light and air. This is helpful to builders in general. It naturally does not suit builders to have to shut up the job or slacken down because of some question such as the above, and the fewer points there are left open to dispute the better it is for the building trade.

In these days of keen competition a good system of

Bookkeeping

is all-important, and all builders have to pay special attention to their books. Opinions differ considerably in the trade upon the advantage of this or that system, but whatever methods are adopted all must have their prime cost book, which is invaluable as a means of keeping a summary of the total wages, as also the cost of cartage and materials, &c., supplied to each job. By referring to his P.C. book the builder is able to ascertain the result of the different contracts, and to fairly accurately gauge whether he is losing or making money on any particular one during the progress of the work.

Joinery books have also to be kept showing the cost of the work in the shops, and the different totals can thus be easily transferred to the P.C. book.

The Checking of Invoices and Accounts

is very important, requiring, as it does, great care and accuracy on the part of the invoice clerks and the staff responsible for this branch of the indoor work. The system of wages sheets and mode of paying is much the same throughout the trade, the sheets being made up to Friday night and sent in by the foreman to the office early Saturday morning. It is customary for the foreman in the space on the sheet to enter up all materials received on the job, specifying the date and from whom received and also particulars as to the quantity, &c., and this information serves a useful purpose as a means of checking.

Builders' Notes.

Irish Granite and Marble.—The works and quarries of the Galway Granite Co., and Marble Works, Ltd., were opened by the Lord Lieutenant of Ireland and the Countess of Aberdeen last week.

Messrs. J. & R. Corker, of Ferham Works, Rotherham, manufacturers of the "Drawwell" grate, gained the medal for smoke abatement, heating power, fuel economy and suitability for public and private buildings at the recent sanitary exhibition held at Bristol in connection with the congress of the Royal Sanitary Institute. Messrs. Corker's London showrooms are at Saracen's Head Buildings, Snow Hill, E.C., where the "Drawwell" grate can be seen in action.

Shields Municipal Buildings: Dispute with Contractors Settled.—At a special meeting of the South Shields Town Council last week a report was received from the Municipal Buildings Committee in reference to the dispute between the Corporation and the contractors for the new municipal buildings, Messrs. Neill & Sons, of Manchester, regarding certain mortar and materials used in the buildings, work on which has been suspended for some months. The report stated that the subject of the dispute had been under the consideration of Sir Alexander Binnie and Mr. Hurtzig, as experts, and the contractors, while denying any liability whatever, had agreed to a suggestion made by the experts that they should carry out certain works as a solution of the difficulty. The Council were recommended by the committee to accept this, which they did. The action commenced by the contractors against the Corporation will be discontinued, each party will pay its own costs, and all claims for delay will be waived.

The Labour Market

Board of Trade Returns for June.

The Board of Trade returns show that employment in the building trades was on the whole dull and about the same as a month ago. With bricklayers, however, there was an improvement, and painters were well employed generally. Compared with a year ago employment was, on the whole, better.

As regards London

employment on the whole showed a decline as compared with a month ago, and was rather worse than a year ago. Returns received from fifty London employers show that in the last week of June they paid wages to 8,855 workpeople of all classes, as compared with 9,112 in May last, and 10,947 in June, 1905.

As Regards the Provinces

the returns received from 74 employers associations in towns outside of London show that employment in these towns was quiet generally.

The following statements relating to employment in the provinces of England and Wales and in Scotland and Ireland are based on returns received from trade unions.

With bricklayers employment was dull generally, but showed some improvement compared with a month ago.

With carpenters and joiners it was slack, the percentage of trade union carpenters and joiners unemployed being 5·4 as compared with the same percentage in May and 6·7 a year ago.

With plumbers it showed little change.

With masons it continued slack.

With plasterers it was bad, but slightly better than a month ago; in Scotland, however, it was worse.

With painters it was not so good as in May.

With slaters and tilers it was fairly good in Scotland.

Northern Counties.

On the north-east coast employment with bricklayers and masons and joiners showed some improvement. With painters it was good.

Yorkshire, Lancashire, and Cheshire.

In Sheffield employment on the whole was rather better than a month ago, except with plumbers and plasterers, with whom it continued slack. In Lancashire and Cheshire generally employment was fairly good.

Midlands and Eastern Counties.

At Wolverhampton employment was bad in all branches. At Nottingham employment generally was dull. At Leicester and Northampton bricklayers and plumbers reported some improvement. At Norwich painters were well-employed.

Southern Counties.

Employment showed little change compared with a month ago, except in the Plymouth district, where it was rather worse.

Wales and Monmouth.

Employment with bricklayers, masons, and plumbers was fair, and better than a month ago. With painters it was good.

Scotland.

At Glasgow bricklayers, joiners, masons, and slaters reported an improvement. At Edinburgh employment generally was fair. At Dundee employment with plasterers improved; slaters were well employed. At Aberdeen employment with masons was bad, but showed an improvement.

Ireland.

At Dublin employment generally improved. At Belfast employment showed little change, but at Cork improved.

The Month's Trade

Reports by our Special Correspondents.

THE STONE, GRANITE AND MARBLE TRADES.

In these trades there is little improvement, if any, visible at present. Prospects are brighter, but it will be some time before the expected improvement comes. The Board of Trade reports for June are as follows:—

Employment in limestone quarries in Cumberland and South Durham was good, the same as a month ago and better than a year ago. In Weardale and in Derbyshire employment was fair. It was dull in Somerset blue lias quarries. In the Plymouth district employment continued quiet, a slight decline from a month ago being shown.

As regards other stone, employment was fair in the Newcastle and Gateshead district. In the Sheffield district employment was good in some branches, quiet in others. It was slack in all branches at Barnsley; at Normanton full time was worked. In the Bath stone quarries employment was moderate, and it was moderate also in sandstone quarries in the Forest of Dean; in the Gloucester red stone quarries it was good. Employment in the Clee Hill road material quarries continued moderate. In Forfarshire employment continued bad with much short time.

Employment in the granite quarries in Aberdeenshire on the whole was moderate. In Devonshire and Cornwall it continued bad generally. It continued fair in Leicestershire, and was fair also in North Wales.

In Aberdeenshire employment with sett makers was fair. Employment at Glasgow and Edinburgh was good and the same as a month ago. At Airdrie it was good and better than a month ago. It continued good at Stoney Stanton, and moderate in the Clee Hill district. At Rowley Regis employment was fair but not so good as a month ago.

The returns for imports of stones, slabs and marble, rough, hewn and manufactured, for the month of June, 1906, as compared with the same month in 1904 and 1905, are as follows:—

Tons.			Value.		
1904	1905	1906	1904	1905	1906
116,883	99,686	108,827	£126,712	£105,713	£111,460.

THE CLAY WORKING INDUSTRY.

We are happy to be able to record that the slight improvement which was noticeable last month in the brick and tile trades continues. Employment was moderate, but better than a month ago and a year ago, so we see that there is slow progression to a better state of affairs. The districts where things are better are analysed by the Board of Trade, which reports that employment on the whole was moderate, but was good at Oldham and in Norfolk and Cambridgeshire. It was fair in the Tees and Plymouth districts and in South Wales. In South Staffordshire it was bad. It is obvious from this that the cotton and engineering trades and agriculture are chiefly responsible for the improvement, but that the improvement has not yet become general and spread to the rest of the country.

THE PORTLAND CEMENT TRADE.

This month shows no change in the state of trade. The advance in price alluded to in previous reports has been well maintained, and orders have been plentiful, resulting in all the factories being well employed. The outstanding feature of the trade is the continued heavy demand for export, which is not confined to any particular market but applies to all our colonies and to a number of foreign countries who have been taking larger quantities of cement, not only from England, but the Continent recently, than for many years past. This is no doubt due to the increased popularity of concrete generally, as a building material, and more particularly to the rapid growth of the use of reinforced concrete in so many directions. This fact, coupled with the satisfactory state of the Home Trade, relieves manufacturers of any anxiety as to the disposal of their output for some time to come.

The new Building Act, which comes into operation on January 1st next, will result in a large increase in the demand for Portland cement as, at a rough computation, some 30,000 to 40,000 buildings in the London area will be scheduled for alteration so as to bring them within the new regulations. Reports from the Continent continue to show that manufacturers of Portland cement in nearly all districts are very busy, with, in some cases, their entire output pledged until right up to the end of the year. The statistical position is again in favour of this country, the exports for June showing a large increase, while the imports for the sixth month in succession show a substantial diminution. For the half-year to June 30 last, the imports decreased no less than 35,666 tons, while the exports increased by 84,367 tons. The former figures prove our contention that the Continental manufacturers are so busy in more profitable markets that they will not send their product to this country to compete with the low prices which, notwithstanding the recent improvement, still prevail.

The returns for imports and exports of cement for building and engineering purposes for June, 1906, as compared with the same month in 1904 and 1905 are as follows:—

	Imports.		
	1904.	1905.	1906.
Tons... ...	30,994	19,679	13,782
Value ...	£45,693	24,955	17,031
	Exports.		
	1904.	1905.	1906.
Tons... ...	26,818	40,851	61,551
Value ...	£42,437	64,474	88,036

The similar returns for the six months ending June 30th are:—

	Imports.		
	1904.	1905.	1906.
Tons... ...	139,654	125,093	89,427
Value ...	£203,485	161,979	113,135
	Exports.		
	1904.	1905.	1906.
Tons... ...	180,547	214,173	298,540
Value ...	£298,802	342,136	445,420

The world's production of Portland cement has increased from 2,500,000 tons to some 11,000,000 tons in the last twenty years, and the centre of the industry has shifted from Europe to the United States.

THE SLATE & TILE TRADES.

The Slate Trade.

There has been a slight improvement in the slate trade during the past month, probably accounted for by there being a greater demand for this material than in the early months of the year. The increase, however, is not sufficient to cause any improvement in prices, which still remain extremely unremunerative. Applications for prices have been brisk, but the areas of slating in prospective contracts continues to be small; very few large jobs are open, nor do we hear of many in the near future.

We understand that the Welsh quarries are finding improvements in demand; this demand, however, does not appear to be for material delivered, and it is expected that trade will be still brisker towards the autumn. Already odd sizes here and there have become scarce, which would tend to show that the stocks are being gradually diminished.

The demand for Precelly slates still continues to be brisk. From the Westmorland district we are unable to report any further increase in trade; the demand for these slates being principally for the north of England. It is hoped that in the re-building of the more important thoroughfares in London an opportunity will be found for using some of this material, as in the case of the Piccadilly Hotel, where Westmorland slating has been decided on.

The improvement seems to have spread to Delabole, where the quarries are fairly busy. There is also a slight tendency for prices to harden, and the slate from this district seems to be increasing in favour, as it is now freely specified by architects.

A slate which will commend itself to architects who, for purposes of economy, are unable to use Westmoreland, but desire to have a good stout slate, perfectly reliable for colour, and one that is practically impervious to London atmosphere, is "Viking Green." This slate (as its name would indicate) is produced in Norway, in the Valdres district. Norwegian slates hitherto, though of excellent quality, have left much to be desired in the method of manufacture. The proprietors of this particular quarry have, however, recently taken the best expert advice upon the method of production and sorting, and have recently attached to their staff an experienced Welsh sorter, who is perfectly acquainted with the requirements of various districts, with the result that the slate now produced is vastly superior to any regular sized green slate hitherto placed on the market. A standard has been adopted which will on the average show 50 slates to the foot, each slate therefore averaging nearly ¼in. in thickness. There are three shades of green—viz., best green, dark green, and grey. These slates should not be confounded with those produced in other neighbouring districts in Norway, nor do the proprietors seek financial assistance outside their own resources. The writer, having visited the locality, is able to substantiate these particulars, but at the same time he would caution the public against investing in any company prospecting for slate in the interior of Norway, without due enquiry as to the vicinity of a railway siding, as the success of such undertaking will entirely depend upon having near access to the railway.

Another excellent green slate is the "Unfading Green" from the Eureka quarries, which must not be confused with a slate very similar in appearance, but which after short exposure changes its colour. The "Eureka" slate, for which Messrs. Roberts, Adlard & Co., of Bermondsey, are sole agents, has been used in this country continuously for nearly 40 years, which would seem to prove it is a good, reliable slate, which is further borne out by the agents' statement that in no case has any complaint brought to their knowledge regarding these slates ever been substanstiated. A well-known London architect had occasion recently to make enquiries regarding the durability of "Eureka" slates, and was satisfied, after inspecting some roofs, that these slates were satisfactory. It is not surprising, therefore, that the demand for these slates, especially from architects' specifications, is a constantly increasing one.

Tile Trade.

The reports from the tile manufacturers are on the whole disappointing, the Broseley district especially being short of orders. Some works report that there is an increasing demand for inferior quality tiles. We cannot help feeling that this class of tile would be far better kept out of London, where the danger from tiles cracking across and slipping down is very much greater than in country districts. We understand that until comparatively recently tiles of an inferior quality were used solely in the agricultural districts and were practically kept out of London altogether. Adherence to this policy would remove any possible temptation to pass in a few truck loads of inferiors to help out a job which had been taken at a very low figure.

The tile trade generally in London seems to show an improvement, several large school jobs in the suburbs have recently been let, requiring over 120,000 tiles each, and there seems to be a distinct revival in the use of tiles in preference to slates in the London area. There is still an increasing demand for old roofing tiles, which invariably fetch high prices and are still very difficult to obtain, and only then in quantities of a few thousand at a time.

From the Sussex district the report seems encouraging; the kilns of one large works have been kept fully going, and the material has been disposed of without stacking. Some improvement in the manufacture of both bricks and tiles seems to have been made with very satisfactory results. It may not generally be known that some of the tileries in the Sussex district make nibbed tiles; these, however, should not be confounded with the handmade sand-faced, very few of which are obtainable with nibs. We think it would be well if manufacturers gave their attention to this, as many architects are averse to pinning tiles down; if they do so at all, only in the case of every fourth or fifth course. There is no doubt that a handmade sand-faced tile nibbed and holed, if of good colour and make, would sell freely. Many of the nibbed tiles produced in this district find a ready sale in the south of London, where the cheap railway rate is no doubt of great assistance to the makers.

The demand for hand-made sand-faced tiles is still extremely brisk, the increase in sales being about 50 per cent. above the corresponding period of last year.

THE PAINT TRADES.

The paint trades are fair. As regards materials, the returns for imports and exports for June, 1906, as compared with the same month in 1904 and 1905, are as follows:—

IMPORTS.

	Cwts. 1904.	Cwts. 1905.	Cwts. 1906.	Value. 1904.	Value. 1905.	Value. 1906.

THE GLASS TRADE.

The glass trade continues fair. The Board of Trade reports that employment was good with sheet-glass makers and flatteners at St. Helens. It was fair with glass blowers in London and with flint-glass makers and plate-glass bevellers at Birmingham.

The returns for imports and exports of glass for the month of June, 1906, as compared with the same month in 1904 and 1905, are as follows:—

IMPORTS.

	Cwts. 1904.	Cwts. 1905.	Cwts. 1906.	Value. 1904.	Value. 1905.	Value. 1906.

Plate	4,322	8,537	10,879	6,260	11,142	16,907

THE TIMBER TRADE.

The Board of Trade reports that during June employment with millsawyers and woodcutting machinists was on the whole dull. Trade unions with a membership of 4,602 reported 199 (or 4·3 per cent.) as unemployed at the end of June, which is the same percentage as at the end of May, 1906, while the percentage for June, 1905, was 5·2. Employment was good at Birmingham, Aberdeen, Dundee, Bristol, and Darlington, and improving at Cork and Hull. It was fair at Leeds, but bad at Liverpool.

The Liverpool Market.

Business in builders' timber has been of the steady but uneventful kind, a very fair demand being experienced, chiefly from South Lancashire and from North and East Cheshire. A good deal of timber has been passed over the railways working from Liverpool within the last three weeks to the neighbourhoods of Warrington, St. Helens Junction, Garston, Wigan, Ormskirk, and smaller places in the vicinity of the towns named. Planks and flooring-boards especially have moved freely by rail, and the despatching of these has kept the yards agreeably active.

New interest has been given to the trade by the coming forward of the early consignments of

Canadian wood

for the season. Waney pine has come to hand freely, but good orders had been booked for this timber, so that supplies have been passed on to customers with as little delay as possible. Stocks are considerably in excess of those held a month ago. Apart from contracts, there is a fair demand, and prices are firm. Canadian pine deals have been received in larger though moderate quantities. The consumption has increased slightly. Stocks have also increased and are quite adequate to the demand, but are less than those held a year ago. Prices are practically unchanged. Pine deals from New Brunswick and Nova Scotia have arrived in large quantity, but much of the timber of this class has gone on to Manchester. Values continue steady.

Norway flooring boards

have been received in smaller quantities. Prices have been a shade easier.

Red deals and boards from the Baltic have arrived more freely. The consumption has been light.

Pitch-pine

has come to hand on a much more extensive scale. The consumption has increased, but not nearly to the extent of the increased importations. Stocks are more than double what they were a month ago, though they are little more in the aggregate than half of what they were a year ago.

Oak

of western growth has come to hand very plentifully. The consumption has been greater, but stocks close heavier in the aggregate. Baltic oak has arrived in limited supply, but the demand has been very small. Wood of high quality still brings full prices, but inferior wood is neglected.

Teak

also has arrived in larger quantities, but the demand has been small. Stocks have increased, but values are well maintained.

The Mahogany Market

continues in a strong position, there being a good demand for all wood of fair to high-class quality.

Dock Improvement.

A matter of considerable interest to timber importers at Liverpool was brought before the Mersey Docks and Harbour Board at their meeting on July 12th. This was a recommendation of the Works Committee that the Brocklebank and North Carriers' docks and quays be extended and improved, at an estimated cost of £279,500. The scheme contemplates as its main feature an enlarging of the Brocklebank dock at the north part and on the east side. On this, east side, there is at present a wide expanse of quay and yard space. A large part of this is to be converted into a dock, which will form part of the Brocklebank dock, on the east side of the present dock, and will have a width of 395ft. and a length on the north side of 1,160ft., and on the south side of 940ft., quays of these lengths being made on each side respectively. The eastern half of the south quay will be low, and will form a timber slip-way. The entrance to the existing Carriers' dock, a timber dock, will be widened to 110ft. The main effect of the proposed alterations will be to provide 2,000 feet of quay space in place of 400 feet which now exist, a considerable part of the new space being intended for the convenience of the timber trade.

THE IRON AND STEEL TRADES.

Recent Progress.

A month which embraces such incidents as a substantial reduction in the concerted price for bar iron, some export records, and a definite scheme of united action between the Scottish and North of England makers, can scarcely be said to be lacking in interest.

Omit Sheffield, and all England opened the month with very indifferent prospects as regards home buying.

In the Birmingham district the slackness in the early part of the month was more marked than elsewhere in practically all lines, but especially in common iron. Rumours were early afloat respecting the contemplated reduction in the price of marked iron bars, but makers kept their intentions very much to themselves.

The weakness in common iron was emphasised by reports that business had eventually been transacted at prices a shade under £6 5s., a figure which has not been descended to for some time past.

In structural steel shapes there was a conspicuous lack of enquiry, and only in galvanised sheets was there any degree of briskness. The figure of the Associated makers of £12 10s. was early exceeded. Most makers were able to get £12 12s. 6d., and in some cases even this figure was improved upon.

Sheffield has for some time past enjoyed a very high level of prosperity, and the month opened without any material change in prospects, and all the works appeared to have as much work as they could deal with for some weeks to come.

Middlesbro' shipments of iron, steel, and pig iron proved rather more encouraging for June than had been anticipated, some 127,500 tons having gone abroad and 46,000 coastwise. Manufactured lines, however, did not look particularly hopeful; quotations remained unchanged, and in many quarters the supply of orders appeared to be running short.

In Scotland an extraordinary atmosphere of languor pervaded the pig iron market during the first week of the month. At the same time there was nothing in the prospects of trade that should have given rise to anything of the nature of depression.

The following are a few representative figures:—Steel angles, £7; bars, £8; sheets, £8 5s. 6d.; ship plates, £7 5s.; best iron bars, £7 7s. 6d.; crown bars, £7 2s. 6d.; angles, £7 2s. 6d.; all per ton.

The Half-Year.

In the ebbing and flowing of the tide of a great industry six months is too short a period to produce anything approaching a metamorphose. Fluctuations take place from day to day in the smaller interests which go to make up the whole, but the British markets are so huge, diverse and so widely scattered, that the story of ultimate survival or decline will have to be spread over years instead of months.

Again, the Board of Trade returns are far from being an infallible index to the state of trade. One circumstance which supports this is, that the effects of large exports upon the home trade are not necessarily either consistent or decisive. Another is instanced by the shipbuilding exports. The huge increase of 3½ millions sterling in ships is to a great extent attributable to orders placed during the closing months of last year, and it was during that period that a large proportion of the work was done and the steel and iron contracted for.

However, it would be futile to deny that, on the whole, the January-June of 1906 may be placed among the most profitable and prosperous half-years of recent times.

We reproduce a few comparisons of the lines which possess particular interest:—

Iron and Steel Exports.

January—June.

	1905. £	1906. £
Pig iron - - - -	1,422,908	2,389,462
Wrought iron bars -	492,789	578,344
Iron and steel rails -	1,276,847	1,051,747
Black plates - - -	300,846	304,494
Tinned plates - -	2,407,341	2,322,544
Steel bars - - -	964,392	1,239,306
Cast-iron goods - -	225,548	250,223
Wrought-iron goods -	406,321	475,692
Plates - - - -	703,271	1,007,833
Steel girders, etc. - -	273,406	500,325
Steel goods—generally -	679,747	817,060
Ships - - - -	2,155,573	5,811,192
Implements and tools -	850,481	1,014,763

In the Scotch industrial area the past six months have been practically the most prosperous on record. Prices all round commenced at a pretty high level, and, with the exception of a few incidental fluctuations, have been well maintained throughout. The steel makers have been well employed, and the amount of material rolled is stated to have been over a million tons.

In the Midlands, in spite of the recent slackness, it is generally admitted that the half-year's business has on the whole been very satisfactory, and that the turnover has been in excess of what had been anticipated.

Steelmakers in the Sheffield district have had an exceptionally remunerative half-year. Prices generally have not been raised to inordinate levels, and as a consequence trade has been very steady and consistent throughout.

The Present Position.

The quarterly meeting of the Midland Iron Trade took place at Birmingham at the middle of the month. So far as volume of business is concerned it was altogether a somewhat depressing affair. At the same time signs are not lacking that matters will soon take an upward turn, more particularly in structural steel shapes. Galvanised sheets maintained their figure of £12 12s. 6d. and thereabouts, and makers have plenty of orders on their hands.

The most notable event to record is the decision of the marked bar-makers to reduce their basis price by 10s. per ton, making it now £8 10s. To manufacturers of other shapes this step is regarded with considerable dissatisfaction. It has not, however, come as a surprise, and taking everything into account, there is much to justify the reduction.

Common iron bars are still in a depressed state, and are to be bought at anything between £6 5s. and £6 7s. 6d.

The following are a few representative prices in Iron and Steel in various centres:—

Iron and Steel Prices (per ton).

		£	s.	d.
Iron, crown bars, Lancas.	- - -	7	5	0
,, hoops	,, - - -	7	17	6
,, sheets	,, - - -	7	18	6
Steel bars	,, - - -	7	5	0
,, sheets	,, - - -	8	7	6
Iron angles, Scotland	- - - -	7	2	6
Common iron bars, Scotland	- - - -	7	0	0
Crown Iron Bars	,, - - -	7	2	6
Steel angles	,, - - -	7	0	0
,, bars	,, - - -	8	0	0
Marked iron bars, Staffs.	- - -	8	10	0
Common iron bars	,, - - -	6	7	6
Steel angles	,, - - -	6	15	0
,, joists	,, - - -	7	0	0
Girder plates	,, - - -	7	12	6
Common iron bars, Middlesbro'	- -	7	5	0
Steel angles	,, - -	6	12	6
,, joists	,, - -	6	7	6

In Sheffield and its immediate environment the briskness in all departments is well maintained. Home and export orders are plentiful, and to such a degree of optimism has the locality been aroused that even the South African market is proclaimed to be showing "signs of improvement"!

Exports from Middlesbrough continue good, and in the home trade, although buying is still slack, there is no noticeable retrogression.

The Scotch holidays have opened out with due solemnity, and it will be a few days yet before business pulls round to normal conditions.

The negotiations between the Scotch and North of England makers have now resulted in a definite scheme of co-operation being drawn up. As is natural, the idea is not favourably regarded on all sides, and a protest has already been raised in the House of Commons on the subject.

Suffice to say, the object of the arrangement is to prevent Scotch makers from entering the North of England market, and to give the English makers the run of the Scotch market for plates, angles, &c., only on such terms as the Scotch makers may decide. Providing that prices are not forced up, and there is no reason to assume that they will be, the arrangement is not necessarily antagonistic to the interests indirectly concerned.

In Continental material there has been a slight and apparently temporary slackening in prices. Works all over, however, continue busy. Steel bars are now quoted in the region of £6 12s. c.i.f. Thames, and iron bars about £6 3s. 6d. For steel angles the figure hovers around £6 7s. 6d., and for tees about £6 12s.; joists remain pretty firm at £6 3s. 6d., and channels £6 8s. 6d. and upwards, all the prices named being for delivery ex steamer Thames or equal East Coast ports.

Deliveries of ordinary rolled shapes are still somewhat slow, and altogether the position of the Continental market is not one of absorbing interest to buyers on this side.

OTHER METALS.

Conflicting reports from the United States, consistent only in their unreliability, have created some unsettlement in copper of late, but the fluctuations have not covered a very wide range. There have been rumours of firm reduced prices, but these have not gained much credence on this side. The figures during the past few weeks for Standard copper (cash) have been in the region of £81 in London, subject to the usual additions for small lots and freights. The past few days' movements have brought no material change about.

The general feeling in tin latterly has been somewhat on the slump side. Consumption in England has been low and the Welsh plating trade prospects are not encouraging. Present prices for Straits (cash) are £167 and thereabouts, which is about £10 below the highest figure for the month. This figure must not, however, be regarded as by any means a firm one, even for tin, as expert opinions are widely divergent as to the future.

Lead demand is also slack, and arrivals continue to be small. On the whole prices have kept within a fairly limited range, recent quotations being as follow: Soft foreign, £16 15s.; English, £16 17s. 6d.; pipes, £19 10s.; sheets, £19 5s.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, *Great New Street, Fetter Lane, E.C*

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Beckenham.—For the execution of alterations to Crescent Road Congregational Church. Messrs. George Baines & Son, architects, 5, Clement's Inn, Strand, W.C. :—

		*H. Copeland & Son.			E. R. Palmer.

* Recommended for acceptance.

A Parish Hall at High Felling which forms part of a scheme for church extension, is now being built. The architects are Messrs. Hicks and Charlwood, of 67, Westgate Road, Newcastle, and the contractor is Mr. W. Hall, of Bensham. The building will be of pressed brick, with stone facings.

Builders' Current Price List of Specialities

This list is not intended to promote undercutting, and prices are subject to discounts for a quantity and for cash. Readers are advised to write for these discounts. Where prices for goods are standardised and fluctuation takes place in trade discounts, our prices have the discounts deducted. In some cases it is difficult for firms to quote prices, and we have stated where they will be pleased to send catalogues and quotations immediately on receipt of applications.

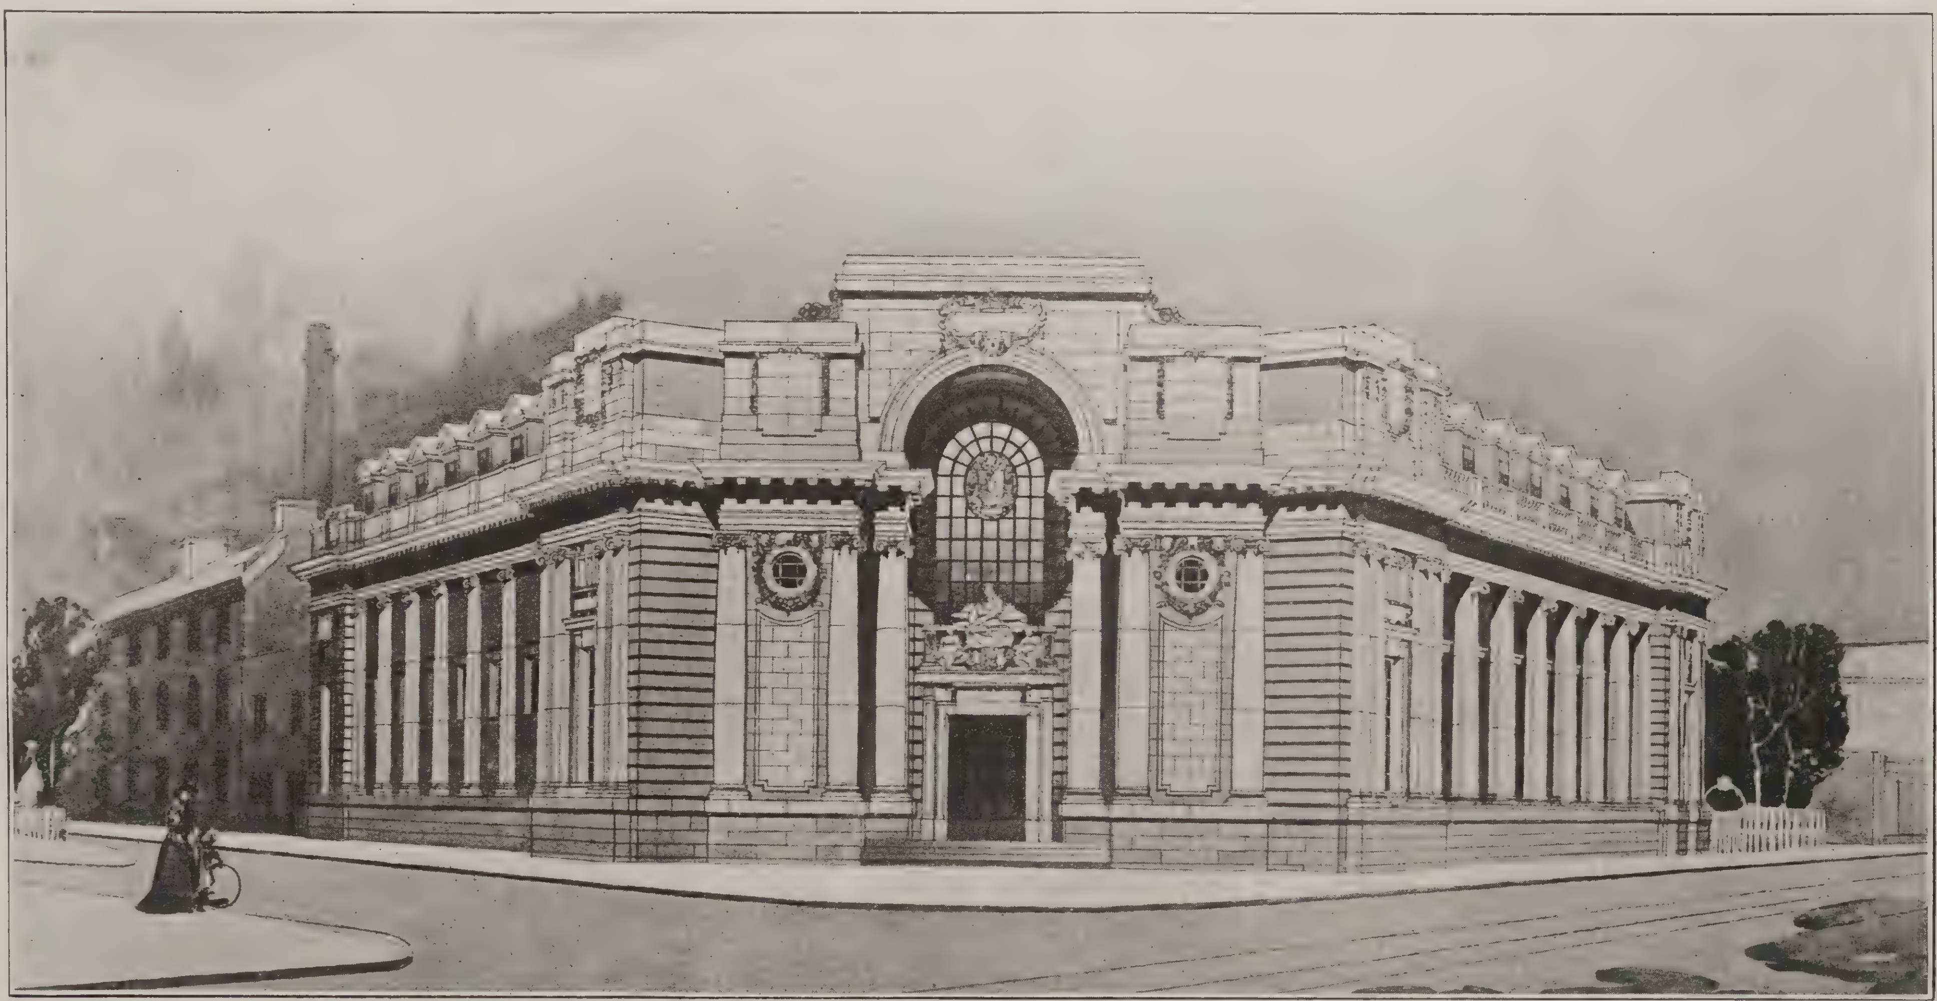
Municipal Builders. THE Secretary of the London Municipal Society, writing to the *Standard*, raises the important question of the efficiency of the London County Council Works Department. His remarks were called forth by the publication, in the Council's agenda, of the report of the Works Committee. The result of all works completed during the half-year ended March 31st last, as reported, is that the balance of cost below the final certificate is £52,589. In this report it was also admitted that the Committee had benefited by the general fall in the price of materials since the estimates were made. This sum of £52,589 is represented as a saving to the ratepayers of London. Of course, as this correspondent points out, whether it is so or not depends upon the sum for which contractors would have undertaken the work. Now, in former years the critics of the London County Council were in the unfortunate position of having little or nothing to go upon, but we are now in the possession of some comparative figures. A survey of the London County Council minutes during 1904 to 1905 shows that the contractors tendered as a rule considerably below the estimates of the Council's estimating officials. In fact, on thirteen works, quoted by the correspondent above referred to, that were undertaken by contractors the accepted tenders amounted to £1,841,238, whereas the estimates amounted to £2,183,906, leaving a balance below the estimates of £342,667, or 15·69 per cent. Comparing this with the last two returns of the Works Department, it appears that the department executed the works it undertook at £80,375 below the estimated cost, or 13·30 per cent. This does not compare very favourably with the 15·69 saving of the contractors. It is true that the contract figures are not taken on the basis of final certificates and cost, this information not being easily obtainable. Nevertheless, on the face of it, the correspondent's plea that contractors are doing work at less cost than the Works Department seems to warrant the closest attention. We have given it as our opinion before, and we still hold to it, that the London County Council Works Committee ought never to have been allowed to burke criticism by bottling up information. It is quite impossible to determine whether the department is paying or not as a whole, and presumably this is what the Progressives and the Labour members would wish. We know the reason which was urged, when first established—namely, that contractors could not be got to compete with the Works Department, but later events have shown that this prejudice is now removed. The contractors are prepared to enter into the lists, and do in several municipalities, in competion with the Public Works Departments. Another suspicious circumstance is that the Progressive majority have refused to allow representation on the Works Committee to their opponents in the Council. We hold no brief for either political party, but we do think that the work of public bodies should be open to the closest inspection. We admit that the Works Department does its work well, but apparently it does it at a greater cost than would result from contractors. We are willing to admit that it might be advisable that jobbing work should be done by the direct employment of labour by municipalities, although this is open to abuse; but in regard to the larger contracts it is natural to expect that the cost of administration by public officials or establishment charges should be heavier than it would be in the case of a private firm, while there are the additional features of a stagnation of talent, and a tendency on the part of the workmen to do less for a municipality than for private individuals. The London County Council Works Department, too, is given exceptional advantages in the way of borrowing money at a low rate of interest, and yet, apparently, cannot compete in cost with outside contractors.

Genius and Originality. WE are accustomed to hear that genius must take care of itself, and that apparently like the wind it blows where it listeth. Our educationists have for long scouted any idea of considering in their scheme of things the genius. Our schools are engaged in instilling in the shortest time into the greatest number a modicum of knowledge drawn up upon a more or less cast-iron syllabus. The pupil is more or less machine-made. He more or less looks at things in the same way as his fellows, and he is not required to think for himself. Originality in the teacher is discouraged, and originality in the student tends to be stamped out. Architectural education seems to be going the same way. The educational enthusiasts in the profession are busy compiling universal syllabuses, and supporters of registration openly express their disregard for the genius, refuse to trouble about whether he is to have obstacles placed in his path, and state that they would prefer one dead level of respectable mediocrity rather than a few flowers in a barren land. The last as it may be, but we would urge the importance of paying attention to the genius. One genius in our view is worth very many ordinary mortals, however talented, because he is an original thinker, a leader of thought. The word genius in its original sense denoted a person's guiding spirit, and from this it became used to denote that intellectual power which has the appearance of proceeding from supernatural inspiration. In this sense it is generally used to-day—*i.e.*, to denote native power in an artist or other thinker. Genius signifies imaginative creation, original thought, invention or discovery, and is contrasted with talent. But if its processes are difficult to analyse and those of talent are not, it does not follow that they cannot be analysed. Genius has been called an infinite capacity for taking pains. So far it may be native and inborn, but even so it can be fostered. The architectural student should be encouraged to think for himself, to think originally, and to take pains, and we may succeed in obtaining a greater crop of geniuses. At any rate, we leave open the road for the architect of genius, rather than putting obstacles in his way, and, perhaps, preventing him practising. Our teachers and our teaching should have originality.



CENTRAL LIBRARY, ST. PANCRAS: SELECTED DESIGN. RUSSELL AND COOPER, ARCHITECTS.

ST. PANCRAS LIBRARY COMPETITION.

We illustrate in this issue the selected design for the central library for the borough of St. Pancras. A meeting of the Borough Council was held on Wednesday evening last, when the award of the assessor (Mr. John Belcher, A.R.A.), was adopted. The competition was limited to the following architects:—Messrs. Russell & Cooper, Wills & Anderson, Maurice B. Adams, Cross & Mallows, J. S. Gibson, and E. W. Wimperis—each of whom received an honorarium of £40. The design selected was numbered 5. The site for the library is a corner one, at the junction of Prince of Wales Road and Anglers' Lane. The disposition of the rooms is shown by the plans on the preceding page. The principal entrance opens into a top-lighted hall, off which all the public rooms are entered (except the juvenile library, to which there is a separate entrance). The lending library has a counter 37ft. long and indicators for 24,000 volumes; the stack-room behind being top-lighted, with 422ft. of shelving, spaced at 5ft. 6in. centre to centre—equal for 42,000 books. The exterior is proposed to be carried out in Luton stocks with stone dressings; floors of rooms to be laid with wood blocks, and halls, &c., with marble mosaic. A price of 10d. per ft. cube has been allowed by the architects, which, for 456,864 cubic feet, works out at £19,036 (inclusive of quantity surveyors' fees). Adding to this £960 for architects' fees, the total estimated cost is £19,996.

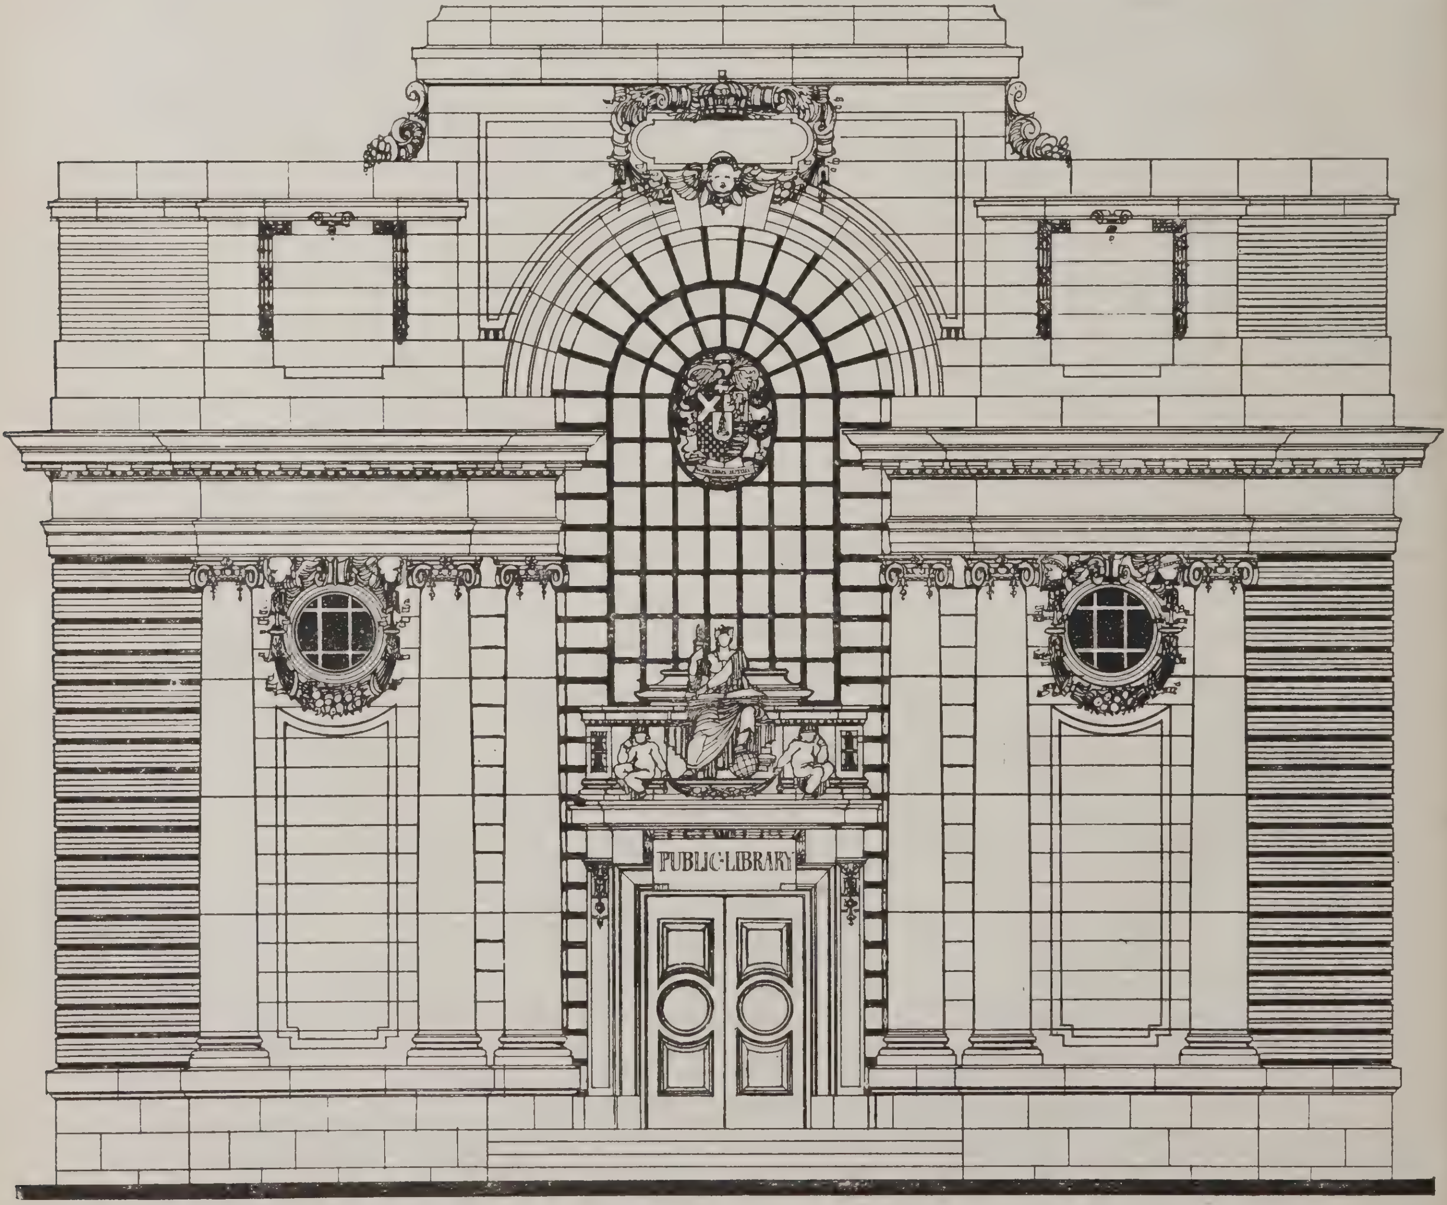
Notes on Competitions

Wesleyan Church, Wallington, Surrey.

In the competition for the above new church the committee have awarded first place to the design of Mr. Frank Windsor, of Croydon, whose design has been accepted from a selection of thirty-two submitted names of architects, with a final selection from drawings submitted by six. The second-premiated design is by (the late) Mr. W. D. Church, of South Place, and the third-premiated design by Mr. H. A. Woodington, of Jermyn Street, London. Accommodation is provided for 600 seatings, and the plan has a large central nave with ambulatories. Exterior work to be carried out in Kentish rag. The architect's estimate, without tower, is £6,640.

Convalescent and Nurses' Home, Glossop.

The issuing, by the Corporation of Glossop, of supplementary information in reference to the conditions of the competition for a Convalescent and Nurses' Home marks one of the most satisfactory results of competitors' protests against impossible conditions that has occurred in recent times. The original conditions were reviewed in these pages on May 30th last, and were of an extraordinary nature, the most objectionable features being—to quote from the Competition Reform Society's disapproval notice of May 24th—"No definite undertaking as to appointment of a professional assessor. No undertaking that the first or any of the designs will be executed. Insufficient information in conditions." The objection, tersely stated in the above notice as "insufficient information," was the one which arose from the extraordinary requirements of the conditions which invited architects to supply particulars of a scheme showing how a sum of £30,000 could effectively be disposed of in a fully furnished and equipped building, the cost of which was not to exceed £6,000, and in investment to yield an income sufficient for the complete support of the establishment and staff. What this meant to the unfortunate competitor will, no doubt, be obvious and need not now be re-stated, having previously appeared in these columns. Suffice it to say that architects were asked to do that which ought to have been done—and, in fact, which could only have been satisfactorily done—by the promoters. The first gleam of hope for better things appeared in a communication from the Town Clerk, which stated that it was intended to revise the conditions and extend the time for sending in designs. The gleam strengthened to a ray when it was subsequently announced



CENTRAL LIBRARY, ST. PANCRAS: SELECTED DESIGN. DETAIL OF ENTRANCE. RUSSELL AND COOPER, ARCHITECTS that the committee had decided to appoint an assessor and to forward particulars of supplementary information to the architects desiring to compete, but that before doing so it was the intention of the committee to visit one or two institutions to enable them to give some idea as to the accommodation to be provided. The ray is now a glow, for the supplementary information is to hand and all is well. The Corporation have decided to appoint Mr. Paul Ogden, F.R.I.B.A., of Manchester, as assessor. If Mr. Ogden has not been already appointed he would appear to have been consulted, for the new particulars have been drawn up with a full knowledge of the requirements of a competition. Provided there is no valid reason to the contrary, the architect whose design is placed first by the assessor will be employed to carry out the work and will be paid in accordance with the recognised scale of charges. The whole of the designs, with the exception of the one placed first, will be returned to the authors, carriage paid, after exhibition. The drawings are no longer to be sent in under motto, but are to be accompanied by a sealed envelope containing the author's name and address; the latter and the drawings will be numbered in the order in which they arrive. Each design is to be accompanied by a declaration that the design is the personal work of the competitor, and that the drawings have been prepared under his own supervision. The competing architects will have an opportunity of viewing the drawings. Full particulars are given of the nature and extent of the accommodation required, and mention is made of the nature of the available local building material. The option of furnishing the particulars of scheme mentioned in the original conditions is left with the competitors. The date for sending in designs has been extended to September 21st, 1906. Thus have all the objections been removed, and nought remains to be said except to congratulate the Corporation upon their courtesy in lending ear to protests and suggestions and upon the breadth of mind they have displayed in their reconsideration of the subject. One point only is left in doubt—namely, the cost of the building. Is the original estimate of £6,000 to stand, or are competitors to place a valuation upon the cubical contents of each block which they are required to figure on the block plan? No doubt this is a matter which will be settled in the replies to competitors' questions.

List of Competitions Open.

DATE OF DELIVERY	COMPETITION.
—	COTTAGE HOSPITAL, LYDNEY. Cost £1.000. Premiums of £5 and £2. Particulars from T. A. H. Smith, hon. secretary Hospital Commitee, Lydney, Glos.
Aug. 18	CHURCH EXTENSION, MAESTEG, Particulars from T. Rees, secretary Bethania Chapel, Maesteg, Mon.
Aug. 21	CEMETERY AND CARETAKER'S HOUSE, STEWARTON. Particulars from James Kerr, clerk to Parish Council, Stewarton, R.S.O., Aryshire.
Sept. 20	SCHOOL AT SUNDERLAND. Limited, to local architects. Premiums of £5o, £20 and £10. Particulars from John W. Moncur, borough engineer, Town Hall, Sunderland.
Sept. 28	SEWAGE DISPOSAL SCHEME FOR ELLESMERE. Premium of £20. Particulars from R. E. Lloyd, Clerk to Urban District Council, Ellesmere.
Sept. 29	REBUILDING OF HENSHAW'S BLIND ASYLUM AT MANCHESTER. Limited to Manchester architects. Premiums £100, £50, and £25. Assessor, Mr. John Holden, F.R.I.B.A.
Oct. 1	ALPHABET COMPETITION. Prizes of £20, £10 and £5. For particulars see "Architectural Review."

Correspondence.

L.C.C. County Hall Competition.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I cannot agree with the statement in your issue for last week that "the announcement will be read with pleasure," &c. I think (with some other London architects) that the terms of this competition as published are *most* unsatisfactory—clearly made for the benefit of foreign architects on the one hand, and, on the other, for the exploitation of the "big wigs" of the Institute, "members of Council," &c. —Yours truly,

HORACE T. BONNER.

LONDON.

[In the *Standard* of Thursday last Mr. Bonner writes as follows in regard to this competition:—"In the final competition eight well-known or so-called 'eminent architects' are to be invited to compete. These favoured eight will come in after the competitors in the preliminary competition are selected, and . . . no doubt . . . will be selected by the Royal Institute of British Architects, which body will probably appoint an assessor to adjudicate upon the whole of the designs. Whether these eight eminent architects will have the benefit of inspecting the designs sent in for the preliminary competition I know not; but I feel assured that the Institute assessor will almost of a certainty recommend one of the eight eminent architects to carry out the work. There is very little chance of success for an ordinary lay member of the profession in this competition under the present conditions, as laid down by the London County Council. The successful man will be, no doubt, either some past vice-president, or a member or past member of the Institute Council, and hence one who will be well known to the assessor or assessors—for Institute assessors know no man professionally outside the Institute's inner circle . . . ."]

[We agree that there is no occasion to make this competition an international one; we think it certainly should be limited to architects practising in this country; but in regard to the appointment of the assessors, and Mr. Bonner's remarks about the Institute, we think it only fair to recall the recommendations of the Establishment Committee (as given in our issue for last week) that "there should be two assessors for the preliminary competition and three for the final, and that Mr. W. E. Riley, the Council's architect, and Mr. Norman Shaw, R.A., should be nominated to act in both stages, and that the competitors in the final stage should vote for the third assessor, who will only act in that stage." Mr. Riley, it is true, is a Fellow of the Institute, but he is by no means a "big wig" in the sense which Mr. Bonner suggests, while Mr. Shaw is, of course, quite outside the Institute. We think, therefore, the charge against the Institute in this case is not consonant with the facts. —Ed. B. J.]

Finchley Cottage Hospital.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—May I suggest that the difference between you and your correspondents, Messrs. Young and Hall, arises merely from a confusion of terms.

The words "Separation" and "Isolation" are often loosely used to describe the same room. To the hospital architect they convey separate and definite meanings. Separation rooms are required for the segregation of a patient requiring special nursing or treatment, or complete quiet; or, on the other hand, of a patient who is noisy, or likely in other ways to cause annoyance to the remainder.

The term "Isolation" as applied to a ward generally implies more serious—indeed, infectious—cases. It happens at times that a patient develops symptoms which give rise to suspicion of infectious disease. For such a case it is useful in all hospitals, small or large, to have a room set apart, and this room should be regarded as a temporary infectious ward; and certainly it should not be used for "paying patients." It is properly called an "observation ward." When the nature of the disease is clearly defined the case should, no doubt, be removed at once to the nearest fever hospital, unless, of course, circumstances render removal dangerous.

An endeavour appears to have been made in this competition to secure an ideal jury to judge the merits of the designs submitted. Its failure is, I fear, due to the fact that the architect member is not, as far as I am aware, intimately acquainted with hospital work. I trust he will forgive this expression of opinion which is made without animus or want of respect for him; but, in common with many others, I have suffered in the past from worthy and upright assessors who unfortunately lacked the necessary knowledge to judge special buildings.

May I add that I was not a competitor in this particular competition, having declined the Committee's kind invitation for personal reasons.

Yours faithfully,

A. SAXON SNELL.

LONDON, W.C.

[We must thank Mr. Snell for his lucid description of separation and isolation wards and their uses in a cottage hospital. We infer from his letter that he is in agreement with us upon the main issue —namely, that the best design has not been selected.—ED. B. J.]

Hove Library Competition.

To the Editor of THE BUILDERS' JOURNAL.

Sir,—I do not wish to revive this somewhat stale and unfortunate subject, but there is just one condition (rather an important condition I consider it to be) which loomed rather prominently in the particulars for the first competition for this building. This condition was that "the new library should accord in architectural style with the Hove Town Hall," which is in the same road and nearly opposite the site for the proposed library. I was further informed that the Corporation were desirous of keeping all their official buildings in that style.

Now, the Hove Town Hall, built by the late Mr. Waterhouse, is almost a replica of the original Prudential Assurance building in High Holborn, while the excellent reproduction of the accepted design (in the second competition) for the Hove Library, in your issue for July 11th last, shows a building of an entirely different "accord"—a poor classic design based upon examples at Hampton Court and the modern classic of the assessor, Mr. Belcher.—Yours truly,

HORACE T. BONNER, A.R.I.B.A.

LONDON, E.C.

Norwich Shirehouse Competition.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—My attention has only just been drawn to a letter, signed "Justice," in your issue for July 4th last, in reference to the above. The ratepayers of Norwich should greatly rejoice that they have such a champion as "Justice" ready to take up their cause unasked. Justice is usually represented as blind, but this "Justice" is evidently bereft of other faculties, or he would certainly have known that the people of Norwich have nothing to do with the Norfolk County Council, for whom were obtained the tenders published in your Journal. "Norwich is a city and county of itself" (see Kelly). As my estimate was added to after the competition, most people would gather that further work was ordered to be carried out, and this is what actually has happened. The Council has ordered further works not contemplated in the original particulars. My original estimate has been proved to be correct, taking the accepted tender in detail. Even now the complete scheme is costing £2,000 less than was voted in the first place for the building without these later additions. I hope I have made it clear that the Norwich citizens are not likely to complain, and that the ratepayers of Norfolk are saving on their original intentions. "Meddler" would have been a better pseudonym than "Justice."

Yours truly,
EDWIN J. TENCH, A.R.I.B.A.
NORWICH.

Llanidloes Public Hall Competition.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In your issue for July 18th it is stated that in "open" competition Messrs. Shayler and Rigg's design for the Llanidloes Public Hall has been accepted. Some months ago architects were invited to send in their names if prepared to furnish competitive designs. I understand from enquiries made that five local Welshmen were invited, each of whom was to receive a fee 30 guineas, but one declined to compete after seeing the conditions, which reduced the number to four.

Yours truly,
X. X.

Pecksniff's Defence.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I scarcely felt the prejudice of 50 years was likely, in any measure, to be dispelled by my letter, but I had hoped it might produce some better response than the mere gibes destitute of argument that have ever been our lot, and that I might be spared the tattered assumption that architecture is neither a trade nor a profession, but an art.

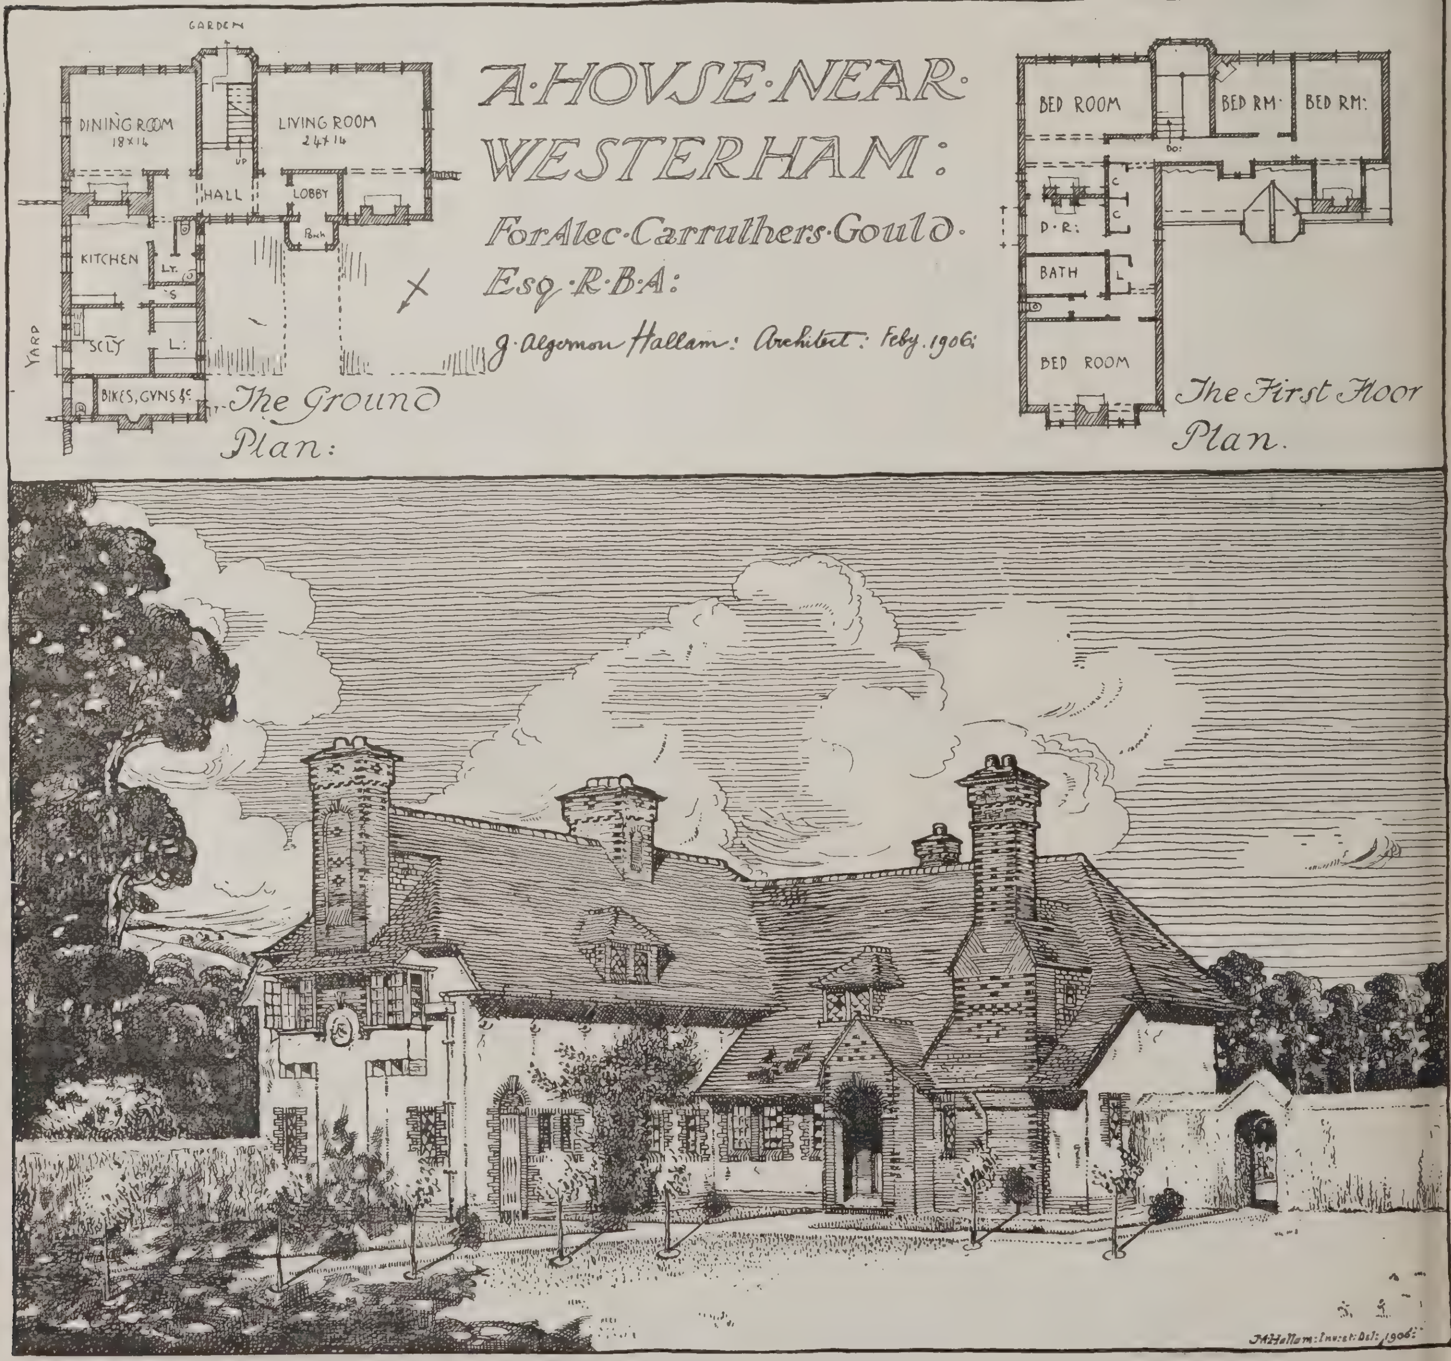
It cannot be contended that architecture as practised by moderns is an art (even if you exclude any able relatives), and Mr. Sampson, in his haste to call me names, shows ignorance of the Pecksniffian creed.

No true follower of my ancestor regards his profession as a mere means to personal gain. His sole aim is to obtain the best possible results; the monetary reward is but the just tribute to organised success.

We cannot but contemplate with infinite admiration and some amusement that ever decreasing band of valiant visionaries who, in an age of dominant commercialism, bravely prate of "their art," and essay to pit the puny vanity of purely personal achievement against the science of organised effort; we shall watch with exceeding regret their gradual disappearance—they, at least, adorn the profession.

I deeply deplore the necessity that compels me to adopt a pseudonym, but I shall be delighted to reveal my identity to Mr. Sampson. Perchance his enthusiasm might convert even me to his lofty but illogical ideals.

Yours truly,
PECKSNIFF MINOR.



Notes and News

Box Tunnel, on the Great Western Railway, has been entirely closed for repairs to the brickwork lining the roof.

A Sky-scraper with Steel Walls.—San Francisco is to have a fifteen-storey building, of which all the walls are to be of steel plates.

A new Pavilion at the Crichton Royal Institution, Dumfries, is to be built. The architects are Messrs. Sydney Mitchell & Watson, of Edinburgh.

A New Leaflet on the Ventilation of Churches has just been issued by Messrs. Robert Boyle & Son, the well-known ventilating engineers, of 64, Holborn Viaduct.

Glen Afton Sanatorium, New Cumnock, which has just been opened, was designed by Mr. Allan Stevenson, of Ayr. The building has at present 14 beds. The cost will be about £10,000.

A Baptist Church at Hertford is being erected from plans by Messrs. George Baines & Son, of London, at a cost of £2,251. Messrs. F. Wood & Co., of Luton, are the builders.

The Victoria Memorial Convalescent Home at Stirling has just been opened. There is accommodation for 16 patients, and the grounds cover 2½ acres. Mr. E. Simpson, of Stirling, is the architect.

The chancel of Warrington Parish Church is proposed to be restored at a cost of £5,000. The architects do not consider that there is any immediate danger of a collapse of this old building, but think it will not be safe to prolong the work too far.

Barrington Court.—The National Trust still requires £900 to complete its fund for the preservation of Barrington Court, Somersetshire. Donations or promises should be sent to Mr. Nigel Bond, secretary, the National Trust, 25, Victoria Street, Westminster.

A new Town Hall for Salford is proposed. The Town Hall Committee have asked the Corporation to authorise them to obtain alternative designs and estimates of the cost of a new town hall on the sloping ground in Peel Park, near the Victoria Arch, and for that purpose to engage an architect.

Mr. Walter Emden, J.P., after practising for nearly forty years as an architect, is retiring. The practice will be continued under the style of "Emden, Egan & Co.," by Mr. S. H. Egan, senior partner, Mr. W. S. Emden (nephew of Mr. Walter Emden), Mr. A. J. Croughton and Mr. T. C. Ovenston. Mr. Walter Emden is about to be married.

Festiniog Slate Trade: Cheerless Outlook.—The outlook for the slate trade at Festiniog remains as cheerless as ever. Since the depression set in twelve months ago nearly 600 fewer men have been employed at the quarries, causing a 30 per cent. reduction of the output. There is a huge stock on hand, particularly in the smaller sizes of slates.

South Norwood Congregational Church—The foundation stones of this church were laid last week. The present contract, which embraces the church, the tower up to the belfry stage, together with vestries, cloak-rooms, &c., amounts to £4,090, and has been let to Messrs. Walter Lawrence & Son, of Waltham Cross. A large future school is arranged for as part of the scheme. The architects are Messrs. George Baines & Son, 5, Clements Inn, Strand, London, W.C.

Institute of Sanitary Engineers.—Vol. IX., part 2, of the "Journal" of this Institute has just been issued from the offices, 19, Bloomsbury Square, W.C. It contains the following papers: "Estate Development," by A. A. Kemp; "Ventilation of Buildings," by F. Aldous; "Some Notes on the Liernur Improved Pneumatic Sewerage System," by Francis Liernur; "The Planning and Construction of Factory Buildings, with special regard to the application of armoured concrete," by A. Alban H. Scott.

An Office Building by Prof. Pite.—On the western side of Euston Square, with a main frontage to Euston Road, a new building for the London, Edinburgh and Glasgow Assurance Co., Ltd., is to be built from designs by Prof. Beresford Pite, F.R.I.B.A. The site is now being cleared, and it is expected that the foundation-stone will be laid in October, and that the company will be in occupation of their new premises by September, 1907. Mr. Gray Hill of Coventry, has secured the contract.

A Cement Block Church.—St. Joseph's Catholic Church, Sunderland, is being built entirely of cement blocks. The regular walling blocks are 2ft. 8in. long, 10in. deep, and 9in. wide; each weighing about 140lbs. The blocks are made on the premises, and two men can turn out about 120 blocks per day. Each block has a rough cast face for the outside, the other three sides being smooth, with three hollow spaces down each block, the middle one of which can be filled with cement as the walling proceeds.

A new Church, at Hon Green, Ross, has been erected at a cost of £3,000. It is in Gothic style, built of sandstone obtained in the neighbourhood, with facings and buttresses of Bath stone, and is covered with stone tiles removed from Queen's College, probably 400 to 500 years old. The roof is barrel shaped. The church divided by an oak screen made by Mr. Clarke, of Hereford. The flooring of the chancel is raised two steps above the church and is laid with black and white marble slabs. The floor of the nave and aisles is wood-block. Mr. G. F. Bodley, R.A., was the architect, and the builders were Messrs. Rattee & Kett, of Cambridge.

The New Good Warehouse for the North British Railway at Glasgow is 503ft. long by 321ft. broad, and 84ft. in height from the basement. There are three floors, each measuring about 3½ acres. The flooring is of "ferrolithic" and expanded metal. The building is all of brick and steel. There are 129 steel columns, each certified to bear about 600 tons weight; and the foundations for these columns consist of concrete 18ft. 6in. square, and 5ft. thick. On the top of this is solid blue brickwork finished off with steel joists, which are filled in with "ferrolithic." Ten sets of rails lead into the ground floor of this mammoth warehouse, and there is half a mile of platforms of brick and "ferrolithic." Everything will be worked electrically.

No. 17, Fleet Street.—The London County Council has now arranged that the Council Chamber, at 17, Fleet Street, the house so long, but incorrectly, known as the Palace of Henry VIII. and Cardinal Wolsey, can be viewed by the public between the hours of 10 and 2. In the evening the room will be available for meetings of societies and other bodies on application to the Council. The front, it will be recollected, was some time ago restored by the Council. In the Council Chamber above referred to the chief treasure is the plaster ceiling, the restoration of which has been a work of extreme difficulty. It was taken down in sections and removed to South Kensington Museum, where it was cleaned, straightened and strengthened before refixing. The staircase is of eighteenth century work and the stained glass windows are also a feature of interest. It is proposed to issue a handbook (illustrated with 12 views) descriptive of the architectural and historic interest of the place.

Law Cases.

Reinforced Concrete.—In the Court of Appeal last week the case of *Mouchel v. Cubitt & Co.* was heard. This was an appeal from a decision of Mr. Justice Swinfen Eady at the end of last June, which was an application for an interim injunction made in an action brought by L. G. Mouchel, agent for the Hennebique ferro-concrete patents, seeking to restrain the defendant builders and contractors from carrying out, or contracting to carry out, without the written consent of the plaintiff, any ferro-concrete or other similar work which might be in competition with that system, in breach of a covenant in those terms contained in clause 12 of a licence to use the system "within the town of London" granted them by the plaintiff on March 2nd, 1903. The restriction was found by the defendants to lead to inconvenience, and even loss of business in cases where their customers preferred some other system, and friction also arose between them and the plaintiffs. After some correspondence the defendants wrote on March 29, 1906, formally repudiating the restriction, of the validity of which they had begun to entertain doubts, and stating that with a view to raising the question at law they intended to use, under a contract for building at Messrs. Whitbread's brewery at Chiswell Street, E.C., reinforced concrete work according to a system which competed with but did not infringe the Hennebique patents. That contract was carried out under protest, but the plaintiff took no proceedings by reason of business relations existing between him and Messrs. Whitbread; but other instances having occurred in which he suspected breaches of the covenant in other parts of the country, these proceedings were commenced. Mr. Justice Swinfen Eady granted an interim injunction on the usual undertaking by the plaintiff as to damages. Defendants appealed,

Counsel for the appellants contended that the claim was unreasonable, and that the covenant in the licence was inoperative as being too wide and in restraint of trade.

Counsel for the respondent were not called upon by the Court, who declined to go into the question of the validity of the covenant, considering that to be a matter to be disposed of at the trial of the action; *prima facie* the plaintiff had a plain contract, and the defendants were committing a breach of it. A speedy trial of the action had been offered in the Court below, which had not been accepted, and on the balance of convenience their Lordships agreed with Mr. Justice Swinfen Eady and dismissed the appeal.

R.I.B.A. MIDSUMMER EXAMINATIONS.

Pass List.

The following is the pass list of the Midsummer examinations of the Royal Institute of British Architects :—

The Preliminary Examination,

qualifying for Probationer R.I.B.A., was held in London and the undermentioned provincial centres on June 12th and 13th. Of the 257 candidates admitted, 63 claims for exemption from sitting were allowed. The remaining 194 candidates were examined with the following results :—

District.	Number Examined.	Passed.	Relegated.
London	95	66	29
Belfast	11	8	3
Birmingham	2	2	—
Bristol	7	4	3
Cardiff	7	2	5
Glasgow	2	2	—
Leeds	19	12	7
Liverpool	12	8	4
Manchester	25	17	8
Newcastle	14	8	6
	194	129	65

The following passed candidates, with those exempted—numbering altogether 192—have been registered as Probationers :—

R. A. Abbott (Auckland, N.Z.)
R. Anderton (Bournemouth)
J. W. Arbuckle (Belfast)
H. K. Armitage (Stockport)
A. F. Ashford (Hoddesdon)
E. R. Austin (Bristol)
A. S. Averill (Nottingham)
P. Badcock (Leyton)
G. Bain (Aberdeen)
L. H. Bakes (Idle)
H. J. L. Barefoot (London)
G. Barlow (Manchester)
H. T. Barnard (London)
H. R. H. Bath (Salisbury)
O. K. Beattie (Edinburgh)
N. S. Benison (London)
G. Bennett (Gravesend)
J. N. Berry (Huddersfield)
J. H. Best (Belfast)
S. F. Beston (London)
E. A. F. Bisshopp (Ipswich)
F. Blackford (Edgbaston)
E. R. Blount (Ryde)
H. Bottomley (Stalybridge)
W. R. Box (Eastbourne)
J. S. Boyd (Glasgow)
W. T. Broome (Sydney)
W. A. Brown (North Norbury)
J. A. Bruce (North Shields)
L. H. Bucknell (London)
A. Burgess (Liverpool)
J. F. Cameron (London)
C. M. Cantley (Ipswich)
W. C. Caton (Hove)
B. Chaikin (London)
J. M. Clarke (Preston)
F. L. W. Cloux (London)
W. H. Coate (Luton)
W. F. Cole (Plymouth)
W. Coles (Barnsley)
W. B. Collier (Blackpool)
H. C. Constantine (London)
S. T. Cook (Plymouth)
L. Costley (Monifieth)
J. Coulthard (Carlisle)
J. F. Cowper (Manchester)
G. S. Creagh (Gillingham)
H. C. Crone (Richmond)
F. E. Crutchley (Liverpool)
F. E. Culling (Swaffham)
A. B. Dailey (London)
F. G. Dawbney (Reading)
N. T. Debogory (Bulgaria)
W. J. Dickinson (Gateshead)
F. S. Dod (London)
A. K. Dodds (Berwick)
G. Doyle (Bristol)
M. Duncan (Liverpool)
W. J. Durnford (London)
C. G. Eales (Hull)
L. R. G. Errington (London)
W. A. R. Fallon (London)
C. A. Farey (London)
R. W. Fellows (Nottingham)
G. A. Fortescue (London)
B. Fownes (Hastings)
J. H. Fulford (London)
E. T. Gale (Lee)
F. G. Geary (London)
E. G. Gisby (Stafford)
A. R. Gunn (London)
H. Halstead (Blackburn)
W. H. Hamlyn (Great Sutton)
C. H. Hartmann (Weybridge)
A. O. Hector (Crieff)
A. Hemingway (Wimbledon)
J. F. Hennessy, jun. (Sydney)
N. W. Hick (Scarborough)
G. F. Hillman (London)
H. E. Hinchliffe (Mytholmroyd)
F. W. Hipkins (Sheffield)
H. A. Hodgson (Birkenhead)
F. Holden (Blackburn)
L. Horsfall (Luddenden)
R. Hotz (London)
W. W. Houston (Belfast)
G. Howkins (Rugby)
F H. Howlett (Pontefract)
J. W. Howroyd (Bradford)
A. F. Hunt (London)
A. Ingham (Hebden Bridge)
D. W. Irving (Crewe)
R. Jackson (Shrewsbury)
T. S. James (Cardiff)
T. G. Jenner (Bath)
H. C. Jennings (London)
H. Jennings (London)
R. J. Johnston (Brighton)
M. Johnstone (Carlisle)
T. E. Jones (Port Dinorwic)
W. J. Jones (London)
W. H. Judges (London)
W. J. Kendall (Leeds)
J. Kennedy (London)
M. W. T. Klug (London)
F. W. Knight (Hitchin)
F. L. Kruckenberg (Ickley)
R. Lambert (Shipley)
C. A. Landsell (London)
F. B. Last (Harborne)
F. H. Lawson (Gosforth)
P. H. Lawson (Chester)
A. E. Leeson (Burnt Green)
T. E. Legg (Woodford Green)
A. D. Leroy (London)
H. R. Levy (London)
T. A. Lodge (Crookham)
C. W. Long (London)
A. Lowcock (Dronfield)
W. Lucas (London)
D. McF. McCaul (Chislehurst)
T. J. Mather (Denbigh)
R. E. Matthews (Coventry)
H. Moliver (London)
W. V. Morgan (Norwich)
F. H. Morley (Leicester)
H. E. Moss (Surbiton)
E. Nixon (Newcastle-upon-Tyne)
W. Oates (Halifax)
G. Owen (Warrington)
A. T. Parker (Southend-on-Sea)
W. Parker (Redditch)
S. C. Parrott (Luton)
J. Paterson (Berwick)
A. E. Peck (South Shield)
G. S. Peddie (Glasgow)
T. J. Peters (Newcastle)
H. B. Ponder (Hastings)
C. W. Porter (Manchester)
A. Pratten (Reading)
W. H. Price (Bridgwater)
W. J. Pywell (London)
T. Reive (Manchester]
R. T. Rhodes (Epping)
A. I. Richards (Yon Pentre)
N. V. Roberts (Bradford)
H. L. Robinson (London)
J. C. Rogers (Weybridge)
R. Rostron (Southport)
E. Roughley (S. Helens)
D. W. Rowntree (London)
H. J. Rowse (Liverpool)
G. Royle (Manchester)
E. C. Rycroft (Thornton Heath)
H. F. Saunders (Margate)
W. Shackleton (Bradford)
S. W. Sherren (Croydon)
A. G. Shoosmith (Hertford)
D. G. Shrubsall (London)
F. A. Silk (London)
E. Smith (Wisbech)
F. N. Smith (Nottingham)
H. F. Southcott (Sydney)
J. N. G. Stafford (Birmingham)
S. J. Stainton (Tipton)
H. C. Strickland (London)
E. J. Sutcliffe (Hebden Bridge)
H. Sutcliffe (Otley Road)
C. M. Swannell (London)
E. J. Tanner (Beckenham)
A. G. Taylor (Kingston-on-Thames)
F. Thorp (Southport)
J. H. Tiffen (Carlisle)
C. B. Todd (Hull)
A. A. G. Toone (Manchester)
F. Tranmer (Scarborough)
N. Tregelles (Hoddesdon)
A. C Tricker (Surbiton)
A. H. Turner (Caversham)
G. A Tyson (London)
S. F. G. Underwood (March)
C. Voysey (Chorley Wood)
F. W. Walker (Derby)
W. Waller (Barnsley)
F. R. Ward (Wednesbury)
A. Watts (Manchester)
P. E. Webb (London)
P. J. D. Webster (London)
J. Weinberg (London)
C. T. Whiteley (Shipley)
T. B. M. Wightman (Glasgow)
C. B. Willcocks (Caversham)
H. Wilson (Tadcaster)
W. Wood (West Bromwich)
C. Worssam (Elstree)

The Intermediate Examination

qualifying for *Student R.I.B.A.*, was held in London and the undermentioned provincial centres on June 12th, 13th, 14th and 15th. 156 candidates were examined, with the following results :—

District.	Number Examined.	Passed.	Relegated.
London	98	50	48
Belfast	1	1	—
Bristol	12	6	6
Glasgow	4	3	1
Leeds	15	5	10
Manchester	21	8	13
Newcastle	5	3	2
	156	76	80

The passed candidates, who have been registered as students, are as follows, the names being given in order of merit as placed by the Board of Examiners :—

P. K. Hanton (London)
J. C. Beare (Newton-Abbott)
F. T. Bush (London)
J. D. D. Watt (Falkirk)
J. Grieve (Bradford)
J. L. Hampson (Bolton)
H. H. Bradford (London)
H. L. Charles (Hereford)
A. F. Bryan (Leicester)
W. S. A. Emden (London)
R. W. Caldwell (Glasgow)
D. Colville (Aberdeen)
P. T. Adams (London)
B. V. Bartholomew (London)
R. Orr (Ringwood)
T. S. Hosking (Bristol)
T. H Whittaker (Nottingham)
C. H. Murray (London)
W. A. Rigg (Carnforth)
W. H. Mitchell (Sale)
H. L. Wrigley (Stourbridge)
R Stockton (Heaton Norris)
A. F. Pelling (Durham)
C. H. Rose (London)
T. C. Mannooch (London)
H. T. Rainger (Cheltenham)
W. S. Mills (Leicester)
A. H. H. Jenkins (Blackmill)
L. W. Walton (Nottingham)
J. McN. Jeffrey (London)
W. H. Wilson (London)
W. E. Woodin (London)
C. S. Madeley (Birmingham)
C. A. Aish (Kingston-on-Thames)
R. Wilson (London)
P. K. Kipps (London)
H. A. Dickman (Sherwood)
G. C. Wingrove (Newcastle-on-Tyne)
A. G. Sheath (Eastbourne)
C. D. Arnott (Gorleston-on-Sea)
M. D. Mattison (Weaste)
A. T. Scrivener (Stoke-on-Trent)
R. Pierce (Llanfairpwll)
H. E. Matthews (Yeovil)
A. C. Burtingham (Evesham)
R. H. Murray (London)
J. W. Carter (Rugby)
C. A. Hallatt (Wath-on-Dearne)
W. A. Daft (Oxford)
J. M. Scott (London)
T. Edgar (Belfast)
J. E. Bowness (London)
T. A. D'Arcy Braddell (London)
G. S. H. Bradford (London)
D. J. Campkin (Sutton)
G. S. Cockrill (Gorleston)
A. Cooper (Slough)
W. N. Couldrey (London)
C. W. Davis (Edgbaston)
R. Duckett (Preston)
H. B. Elkington (London)
W. A. M. Fiddaman (London)
G. E. Fitzgerald (London)
E. H. Foster (Thorne, Doncaster)
G. K. Gwynne (Bournemouth)
R. E. Haynes (Shrewsbury)
A. Kay (Pendleton, Manchester)
F. C McC. Maxwell (London)
A. F. Murray (London)
W. W. Tipton (Wellington)
A. Turnbull (Sunderland)
V. Ware (Bournemouth)
J. H. Wheately (Petersfield)
A. Wilby (London)
E. L. Wright (Stafford)
G. H. Yeoman (London)

The Final and Special Examinations,

qualifying for candidature as *Associate, R.I.B.A.*, were held in London from June 22nd to 29th. Of the 112 candidates examined, 61 passed, and the remaining 51 were relegated to their studies. The successful candidates are as follows :—

D. Bamford (London)
F. N. Bamford (London)
H. Blackadder (Broughty Ferry)
A. G. Bray (Bolton)
A. E. Brooker (London)
A. Bullock (London)
W. W. J. Calthrop (Horsham)
*H. R. Coales [Special Examination], Leatherhead
O. H. Cockrill (Great Yarmouth)
T. H. O. Collings (Brighton)
W. H. H. Cooke (Wembley)
R. W. A. J. Cosway (London)
M. J. Dawson (London)
H. B. Downs (Guiseley)
C. W. Eaton (Deane Bolton)
E. H. Edleston (Nantwich)
G. A. Farrar (Manchester)
*F. H. Fitzgerald (Special Examination)
F. J. Forster (London)
F. B. Foster (Weston-s-Mare)
*J. B. Fulton [Special Examination], (London)
E. H. Gandy (London)
L. M. Gotch (London)
A. C. Goulder (Woodford Green)
J. W. Hepburn (London)
G. B. H. Hoole (London)
*P. C. Hoy [Special Examination], (Heaton Mersey)
F. J. Humphrey (Surbiton)
D. B. Hutton (Glasgow)
*E. T. Jago [Special Examination], (London)
*G. T. Jell [Special Examination], (London)
E. R. Kennedy (Belfast)
H. G. Leslie (London)
C. C. Makins (London)
*H. J. C. Marshall [Special Examination], (London)
H. Moss (Manchester)
S. Moss (Eccles)
J. E. Mundell (London)
H. F Murrell (London)
*J. Newton [Special Examination], (Purley)
J. Parlett (London)
S. H. Penlington (Sudbury)
G. E. Phillips (London)
H. A. Rowbotham (London)
* J. Rycroft [Special Examination], (Bradford)
W. P. Rylatt (Leeds)
J. P. Salwey (Reading)
V. G. Santo (Shrewsbury)
W. P. Schofield (Leeds)
H. Shackleton (Keighley)
J. Smith (Glasgow)
F. A. Sprules (Sutton)
F. G. Stockdale (London)
C. R. Thickpenny (Watford)
W. I. Travess (London)
E. H. Walker (Doncaster)
E. G. Walker (London)
* B. M. Ward [Special Examination], (Liverpool)
B. Watson (North Shields)
B. C. Westwick (Mansfield)
* A. Woodeson [Special Examination], (Reading)

The following table shows the number of failures in each subject of the Final Examination :—

I.	Design	36
II.	Mouldings and Ornaments	34
III.	Building Materials	11
IV.	Principles of Hygiene	18
V.	Specifications	6
VI	Construction, *Foundations, &c.*	20
VII.	Construction, *Iron and Steel, &c.*	20

---

* The candidates to whose names an asterisk is prefixed entered for the Special Examination, which is for architects in practice not less than 25 years of age, and chief assistants over 30. Such candidates are exempted, by special resolution of the Council, from the Preliminary and Intermediate Examinations, and from submitting "Testimonies of Study."

Obituary.

Mr. Jacob Long, senior partner in the firm of Jacob Long & Sons, builders, of Bath, died on July 13th, aged 71. Among works carried out by the firm are the Roman Promenade and Art Gallery at Bath, under the direction of the late Mr. J. M. Bryden, and the Winsley Sanatorium (Messrs. Silcock & Reay, architects). The firm were the first to tender for all trades at Bath.

SCULPTURE AT BELFAST.

At Belfast it is now possible to compare works of sculpture by three members of the Royal Academy, says a correspondent of the *Belfast News-Letter*. The Queen Victoria Memorial, for grace and beauty of style, will compare favourably with any work that has come from Mr. Brock's chisel. Mr. Pomeroy, however, has not been so successful in this respect in the Dufferin Memorial. The introduction of a canopy has placed the artist under very serious difficulties, and the portrait statue is to a large extent robbed of its beauty by the four Ionic columns, which from many points of view obliterate it. According to the official description, the Dufferin Memorial is a composite work of the sculptor and architect, and the two sister arts seem to have vied for supremacy. Mr. Pomeroy is seen to much better advantage in the beautiful alto-relief on the tympanum of the City Hall of the leading industries of Belfast shipbuilding and linen. Mr. MacDowell is represented by his bronze figure of the Earl of Belfast in the interior of the City Hall.

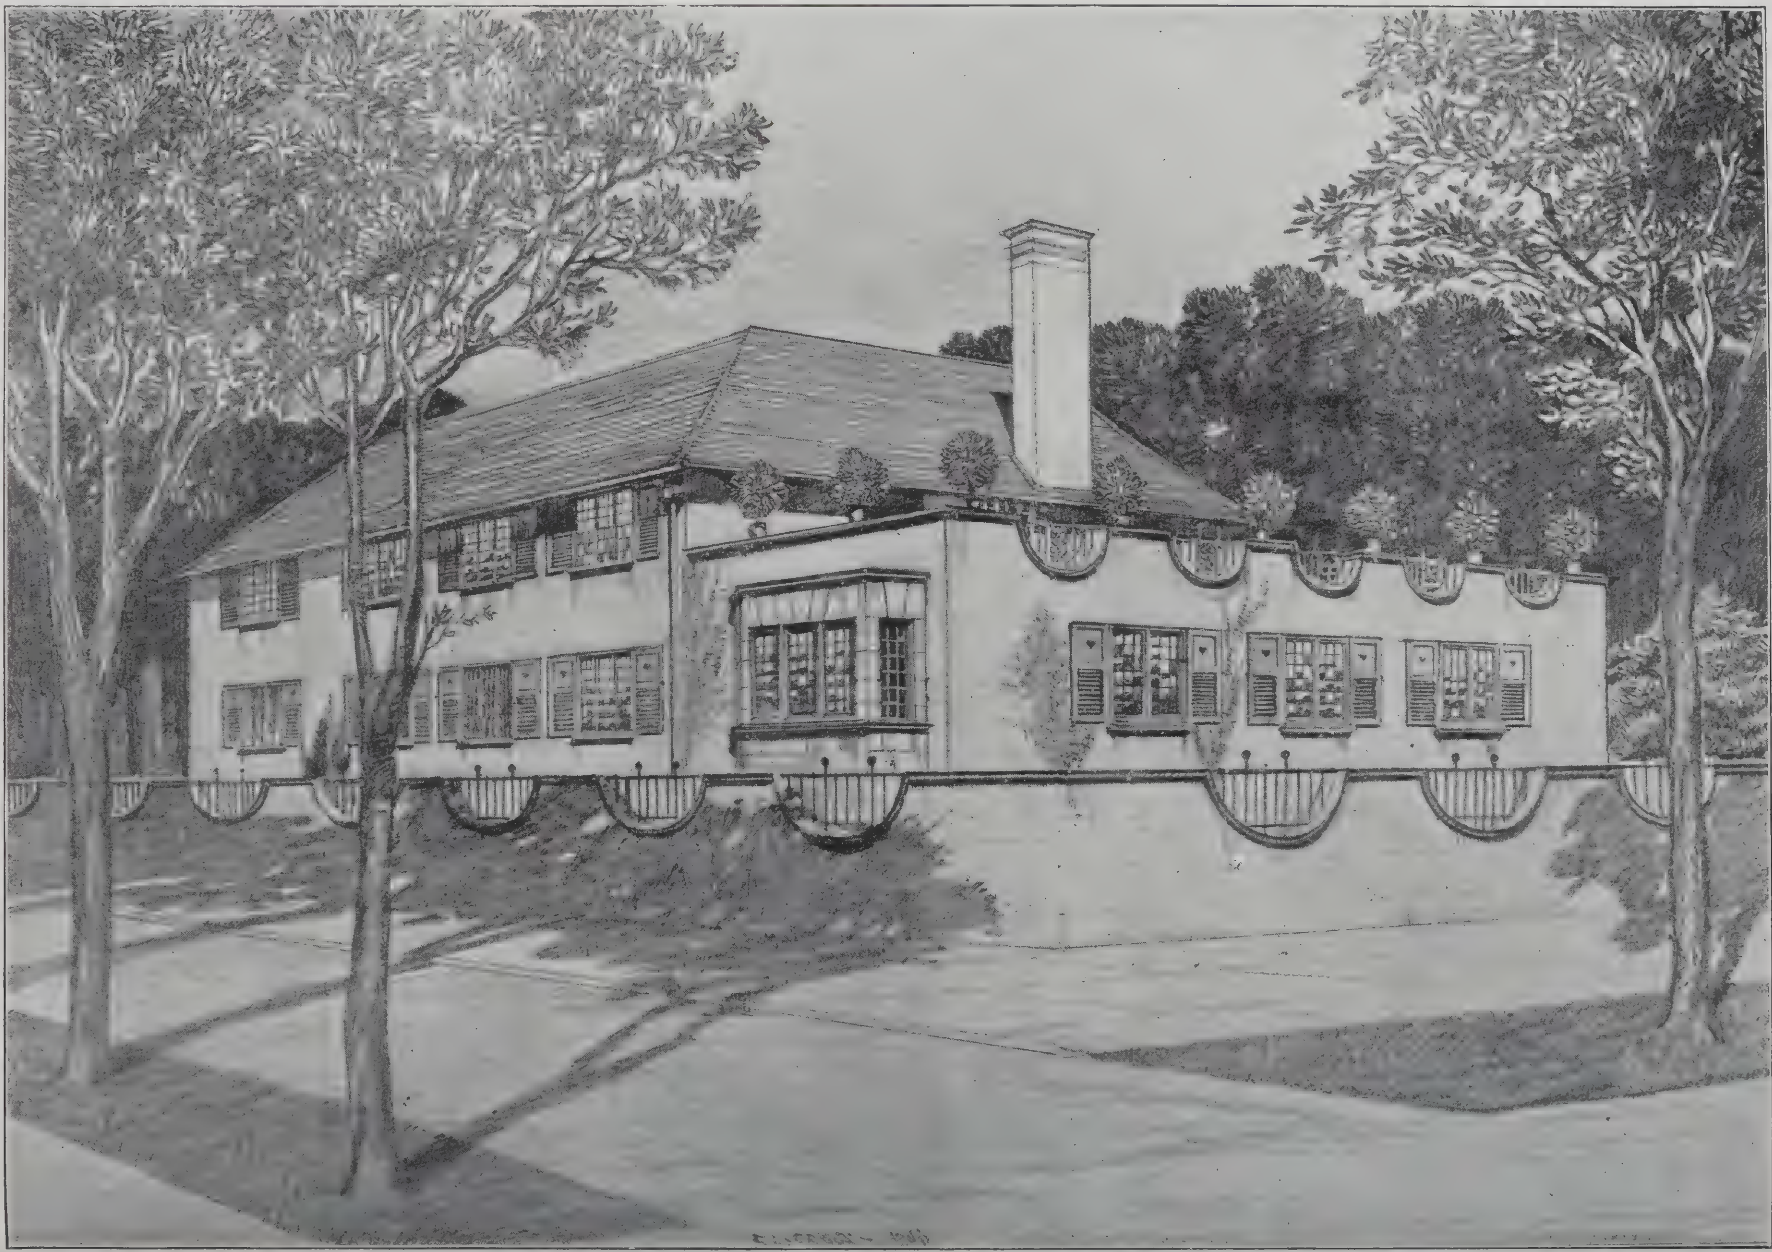
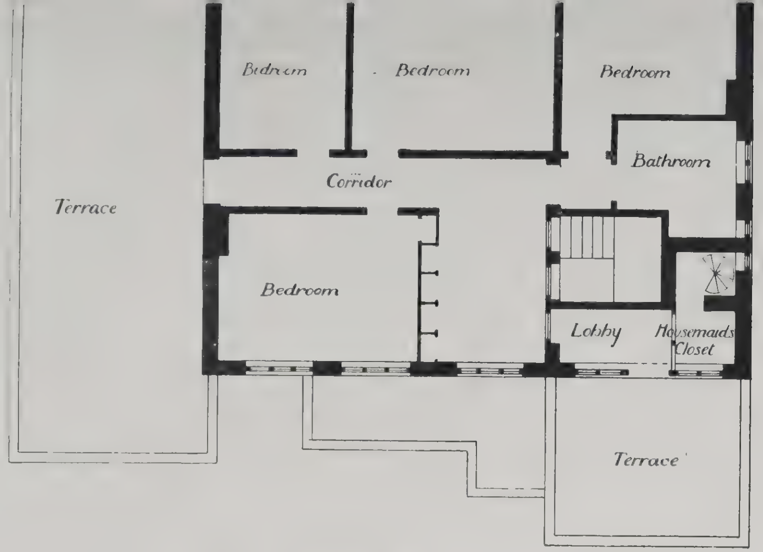
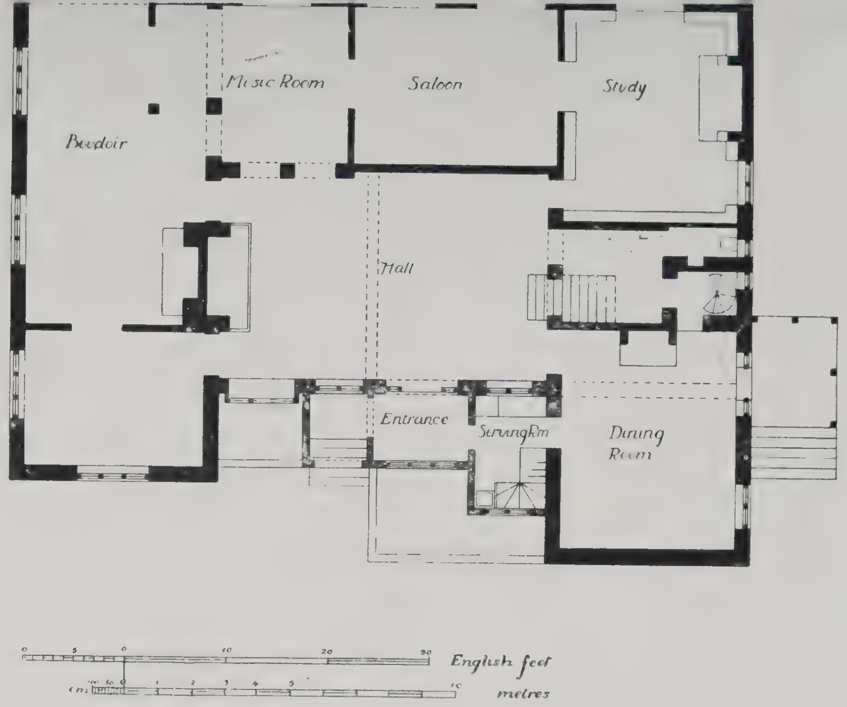
UNIVERSITY OF ILLINOIS

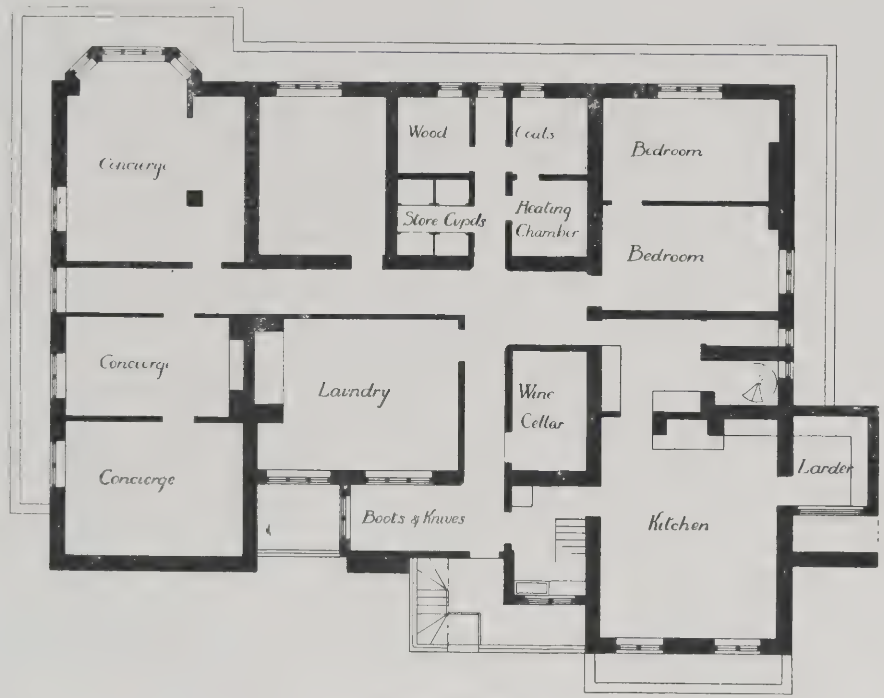




First-floor Plan.



Ground-floor Plan.



Basement Plan.

THE DE SZASZ HOUSE ON THE STEFANIA IN BUDAPEST.

C. R. ASHBEE, ARCHITECT.

This building, designed by C. R. Ashbee for Zsombor de Szasz, Esq., a Hungarian nobleman and member of the Legislature, is placed at the corner of one of the finest streets in Europe, the Stefania, having four double avenues of trees. The building is in white rough-cast, with white Szepsparillia stone, and has green shutters in rows. On the outside of the front portion is a hanging garden upon which stand rows of lemon trees. A big overhanging red-tile roof screens the hot semi-tropical sun from the bedroom windows, which are double, having inside and outside lattices in addition to the shutters, the principal problem being to keep out the sun at certain times of the day during six months of the year. A garden surrounds the house and is screened with stonework and iron railings from the main thoroughfare. The plan is in three parts as shown, the basement portion in charge of a concierge, the ground-floor with a large hall in the centre and suite of reception rooms, and the upper floor containing bedrooms only. At the end of the large fireplace in the central hall is a little statue of the Spirit of Modern Hungary carved in oak and coloured and gilded to stand against a background of white Szepsparillia stone and at present being executed by Mr. Alec Miller, the model for which was exhibited at the last Arts and Crafts Exhibition.

Enquiries Answered.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Bending Moment on Continuous Beams.

YORK.—R. F. writes: "Please give the steps that lead up to the following formulæ in Twelvetrees—"Structural Iron and Steel," p. 119. Beam both ends fixed, loaded uniformly—

$$\text{B.M at centre} = \frac{\text{W.L}}{24}$$

$$\text{B.M at abutments} = \frac{\text{W.L}}{12}$$

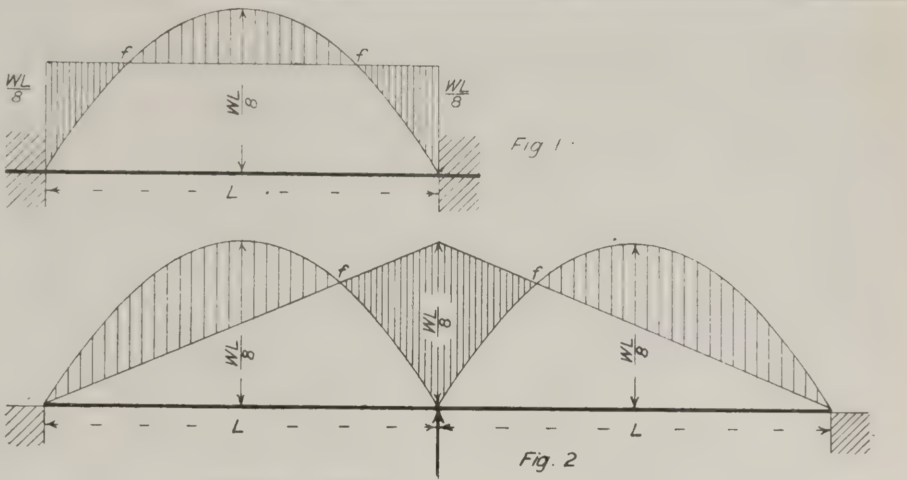
and P. 120 gives a continuous beam of two equal spans, uniform load, ends not rigidly fixed—

$$\text{B.M at abutments} = \frac{9\ \text{W.L}}{128}.\text{"}$$

The bending moments upon a beam of equal and uniform section fixed horizontally at both ends and loaded uniformly over the entire span with a load of w per foot run will be as shown in Fig. 1, where the beam, a parabola whose ordinate at centre $= \frac{wl^2}{8}$, and at ends $= \frac{wl^2}{12}$ are all apparent. The bending moment at centre is then $= wl^2\ (\frac{1}{8} - \frac{1}{12}) = \frac{wl^2}{24}$, or taking $W = wl$ the maximum bending moment $= \frac{WL}{24}$ At the supports it will be as shown above $= \frac{wl^2}{12}$ or $\frac{WL}{12}$

If the beam is continuous over two equal spans, and loaded as above, but with the outer ends free, the bending moments will be as shown in Fig. 2, where the parabola with ordinates in centre each $= \frac{wl^2}{8}$, are drawn. f will be the point of contrary flexure; the open ordinates show compression in top flange and tension in bottom, and the close ordinates show the reverse. The maximum bending moment will be over the central support $= \frac{wl^2}{8}$ or $\frac{WL}{8}$, and it will be nil at the abutments. The calculus would be required for the proof of these formulæ, for which see Rankine and other writers.

HENRY ADAMS.



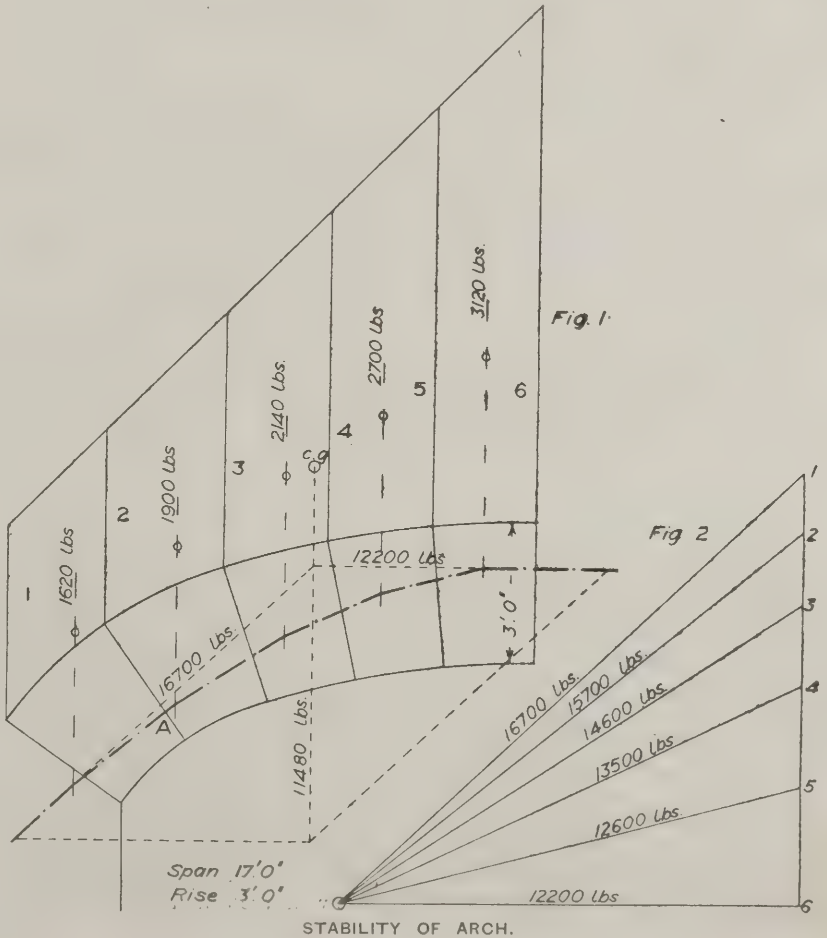
BENDING MOMENT ON CONTINUOUS BEAMS.

Stability of Arch.

BUILDER writes: "I send tracing of an arch and gable which is proposed to be built. "Do you consider this form of arch with voussoirs 3ft. high and 1ft. 6ins. through to the back capable of carrying the gable over, which is of stone walling 1ft. 2ins. thick? The height of the arch cannot be raised and the springing has to be 7ft. from the ground."

The outline of the arch with the load above is shown in Fig. 1. Divide the arch into any number of parts, and find the weight and centre of gravity of each part as shown, numbering the spaces in between. Next find the mean centre of gravity of the whole, and from the top of the middle-third at the crown draw a horizontal line to meet a vertical line through this mean centre of gravity, and from the junction of these two draw a line through the bottom of the middle-third at skewback. Set down the whole weight=11,480lbs. vertically, and by parallelogram of forces the thrust at crown=12,200lbs., and the thrust at skewback=16,700lbs., all as shown in Fig. 1. Then draw the vertical load line 1–6 in Fig. 2 and from the point 6 draw a horizontal line 6–0 equal to the thrust at the crown=12,200lbs. Join 0 to the other points on the load line, and parallel to these lines across the corresponding spaces in Fig. 1 draw the curve of thrust as shown by thick stroke-and-dot line. Then taking the joint which appears to be most liable to failure—namely, that between the first and second voussoirs marked A on Fig. 1—the pressure may be calculated by the formula $\frac{2}{3}.\frac{W}{d} = \frac{2 \times 15,700}{3 \times \frac{3}{4}} = 14,000\text{lbs.} = 6{\cdot}2$ tons per sq. ft., which is within the limits of safety.

HENRY ADAMS.



STABILITY OF ARCH.

Buildings to Measure, near Scarborough.

NEW BARNET.—X writes: "Is there any building within, say, six miles of Scarborough worth measuring for the R.I.B.A. Final examination?"

The church of St. Mary, Scarborough, will probably be the most suitable building for measuring up for the R.I.B.A. Final testimony of study. The greater portion of the church is Transitional Norman and Early English in style. In the south transept there is a decorated chapel and a fine large decorated window. At Scalby there is a good Early English church, of which the chancel is worth particular attention. There is a church at Hackness which is partly Norman and partly Early English. There is also an interesting church at Folkton in the Transitional Norman style. Scarborough Castle is worth a visit. It is a typical Norman castle, and was built by William le Gros during the reign of King Stephen. The keep was rebuilt by Henry II. While in the neighbourhood of Scarborough a visit might be arranged to Whitby, which, however, is now outside the stipulated six-mile radius. H. Y. M.

Surveyor's Right to Disapprove Plans.

BIRMINGHAM.—ARCHITECT writes: "Is a public surveyor of a district empowered to disapprove a set of plans for a number of houses which he admits comply with the by-laws? The buildings are set back to the building line several yards from the road. The surveyor requires an undertaking in writing that when called upon my client will take up the existing hedge forming the boundary to the road, and set back several feet. The surveyor admits that it may be several years before the request is made to set back the hedge. My client refuses to give the undertaking, for several reasons, and states that when the set-back is necessary, then will be the time to ask for same. The surveyor says he will disapprove the plans of the houses if the undertaking is not given. Has he the right to do so?

The surveyor cannot legally advise his Council to disapprove the plans in the circumstances you mention, unless your client is laying out a new street. It is often desirable that questions of frontage should be settled at the same time as the plans are approved, but the surveyor has no legal powers of coercion such as you describe. F.S.I.

Earliest Use of White Bricks.

HERTFORD.—E. E. S. writes: "I have been endeavouring to find out, without success, the earliest known example, in England, of the use of white bricks as ornamental work—such as quoins, buttresses—in (red) brick buildings. Perhaps you could enlighten me. Please, also, recommend a book on brickwork in which the development from early times is treated."

Your question is not quite clear. Do you mean "white glazed" bricks or what are known as "white Suffolk"? If the former, the first makers were the Leeds Fireclay Co., but we can trace no record of the first building in which the bricks were used. As a book which will serve your requirements we would recommend Dobson's "Bricks and Tiles," published by Messrs. Crosby, Lockwood & Son.

Designing Foundations.

W. G. B. writes: "In the case of a continuous wall, say, 50ft. or 60ft. long, carrying, at ground level, a load of 12 tons on each foot length, what would be a suitable design for the foundation, using (1) lime concrete and (2) cement concrete, reinforced with expanded metal in each case, and limiting the pressure on the soil to 1 ton on each square foot?"

An ordinary brick wall should not be loaded to more than 3 tons per ft. super. at base—*i.e.*, on the top course of footings. The footings should be spread by 2¼-in. set-offs on each side to a width of twice the thickness of the wall. The bottom course may be double, when resting upon the soil, but it is unnecessary when resting upon concrete of the usual width—*i.e.*, projecting 6ins. each side. When concrete is used it should be cement concrete, but lias lime concrete may be substituted in certain cases. Ordinary lime concrete is not worth more than so much plain ballast. When the width of concrete requires to be much extended owing to the poor supporting power of the soil it may be reinforced by any of the usual methods. If expanded metal is used it should be, say, 2ins. from the bottom of the concrete, the gauge of the metal being determined by the moment of resistance required for one foot run of the foundation, taken as a cantilever with a span equal to the projection and a distributed load equal to the pressure per square foot on the soil.

HENRY ADAMS.

Buildings to Measure near Portadown.

DOUGLAS.—L.C.C. writes: "Are there any churches near Portadown, in Ireland, suitable to measure for the R.I.B.A. Intermediate Examination: also, is Fountains Abbey, Yorks., suitable for this purpose?"

There is very little work of architectural interest left in the neighbourhood of Portadown. There were, at one time, many fine churches in Ireland, but the majority of these have been so thoroughly destroyed that scarcely a stone remains to indicate their former greatness. At Drumcree, a few miles north of Portadown, there is an old church and the ruins of a church remain at Taummea. Lisburn cathedral, dating from 1622, is rather interesting. Fountains Abbey is full of magnificent features suitable for measuring for the R.I.B.A. Intermediate "Testimonies of Study." H. Y. M.

A Problem in Mechanics.

BECKENHAM.—J. D. S. writes: "With reference to the solution given to "A Problem in Mechanics," on page 9 of your issue for July 4th, I should be obliged if Prof. Adams would show how the apparent discrepancies in the enclosed solution may be reconciled with his solution."

In the solution of this problem given on page 9 the tangential force of the weight was overlooked. This equals W sin 30° $= 10 \times \frac{1}{2} = 5$ lbs., so that the resistance to upward movement on the plane is $5 + 5 = 10$ lbs., leaving the amount free to act for upward movement $15 - 10 = 5$ lbs. But a weight of m lbs. = a force of mg poundals; therefore $f = 5g$ poundals. Now $a = \frac{f}{M} = \frac{5g}{10} = \frac{g}{2}$ ft. per sec. per sec. for the acceleration, and $s = \frac{at^2}{2}$, therefore $t = \sqrt{\frac{2s}{a}} = \sqrt{\frac{2 \times 4}{\frac{1}{2} \times 32}} = \sqrt{\frac{8}{16}} \quad \frac{1}{\sqrt{2}} = 0{\cdot}707$ secs. as the true answer.

HENRY ADAMS.

IN PARLIAMENT.

(By our Press Gallery Representative.)

For some time no matters of immediate interest to builders and architects were dealt with by Parliament, but a crop of questions have been addressed to Ministers in the House of Commons during the last few days.

Ventilation of Edinburgh Museum.

Mr. Weir asked the First Commissioner of Works, in view of the fact that the recently issued Report of the Committee of Council on Education in Scotland showed that the ventilation of the Royal Scottish Museum, Edinburgh, was in an unsatisfactory condition, whether he would state what steps had been taken to remedy the evil.

Mr. L. Harcourt hoped to have a scheme ready for consideration with next year's estimates.

The New War Office.

Mr. Thorne asked the First Commissioner of Works whether it was stated in the specifications for the building of the new War Office that all marble wanted for the work should be dressed and worked on the works.

Mr. L. Harcourt said the answer was in the negative. It would have been most objectionable to have stone and marble worked in the building, but the marble work, other than mantelpieces, had been prepared at the contractors' workshops in London.

Duke of York's School.

Mr. Haldane informed Major Anstruther Gray that the question of the disposal of the site of the Duke of York's School was being considered by an inter-departmental Committee.

Lunacy Commissioners' Advisory Architect.

Mr. Cooper asked the Secretary of State for the Home Department the following question: Whether he is aware that the architect appointed by the Board of Lunacy Commissioners to advise them on submitted plans for the erection or alterations of asylums is one who, in his private practice, is largely engaged in connection with such structures; whether he is in a position to give the name of the person who advises the Commissioners on the plans of asylums designed and erected under the superintendence of their architect; and whether he will consider the advisability of suggesting to the Commissioners the appointment of an architectural adviser, who shall give the whole of his time to the duties of the position?

Mr. H. Samuel, the Indian Secretary, in his reply, said he understood that the statement in the first part of the question was substantially correct. The Commissioners informed him that they found it necessary to select as their adviser an architect who from his personal experience was thoroughly conversant with the requirements of such structures. When plans of asylums designed and created under his superintendence were submitted for their approval it was open to them to employ another architect to advise them in the matter. The question of modifying the existing arrangements, either by appointing a permanent architectural adviser attached to the Commissioners' Department or otherwise, was at present under consideration.

Carnarvon Castle.

Mr. Harcourt informed Lord Balcarres that works of restoration had been going on for some years past at Carnarvon Castle. He was conferring with the Constable of the Castle, Sir John Puleston, as to the further works which might be necessary for the preservation of the fabric.

New Statue in Hyde Park.

In the House of Lords on Thursday last the Earl of Liverpool informed the Earl of Plymouth that it had been decided to erect the bronze statue representing Physical Energy, by the late Mr. G. F. Watts, R.A., at the east end of the Serpentine.

The new Carnegie Library at Walsall, just completed, has been built from designs by Mr. J. S. Gibson, F.R.I.B.A., at a cost of £8,000.

BRUCE HOUSE.

The London County Council's new lodging house, which was opened on July 13th, is the third institution of the kind erected by this authority. The first lodging house erected by the London County Council is situated in Parker Street, Drury Lane, and was opened in January 1893. The second lodging house, known as Carrington House, was opened at Deptford in November, 1903. Whereas the former only accommodates 345 men in separate cubicles, the latter has accommodation for 802 men. Bruce House is, however, an advance on both the above houses and has been erected in compliance with the scheme sanctioned by the Home Office for the re-housing of persons of the working class displaced in connection with the Holborn to the Strand improvement. Bruce House is situated in Kemble Street, off Drury Lane, and is a very similar building to the well-known Rowton Houses erected in various parts of London. It affords accommodation for 699 lodgers and 10 porters, comprising 709 cubicles in all. The building was designed by the Council's architect, Mr. W. E. Riley, F.R.I.B.A. Mr. Maurice Fitzmaurice, C.M.G., the chief engineer of the Council, was responsible for the hot water installation and the electric lighting. The contractor was Mr H. L. Holloway, of Union Works, Deptford, whose tender amounted to £46,100. The work of erection was begun shortly after the acceptance of the tender in 1904.

In clearing the area in the neighbourhood of Clare Market it became necessary to displace a public dispensary, and the Council had to reinstate this institution or pay compensation. It was decided to incorporate the dispensary building with the new lodging house, keeping it quite distinct and separate in regard to its approaches and internal arrangements. The dispensary was opened at the end of last March and consists of, on the ground floor, waiting-room, consulting-room with stripping-room adjoining, dispensing-room, committee-room, secretary's office, lavatory accommodation, stores for bottles and coals, and a yard. On the first floor are the doctor's bedroom and sitting-room; on the second floor, bathroom, and housekeeper's kitchen and scullery; and, on the third floor, housekeeper's bedroom and an additional bedroom.

As regards the lodging house, the following is a general description of the accommodation, planning, &c. :—

The site has an area of about 28,171ft. super., and has a frontage of about 220ft. to Kemble Street, 108ft. to Drury Lane, and 139ft. to Kean Street.

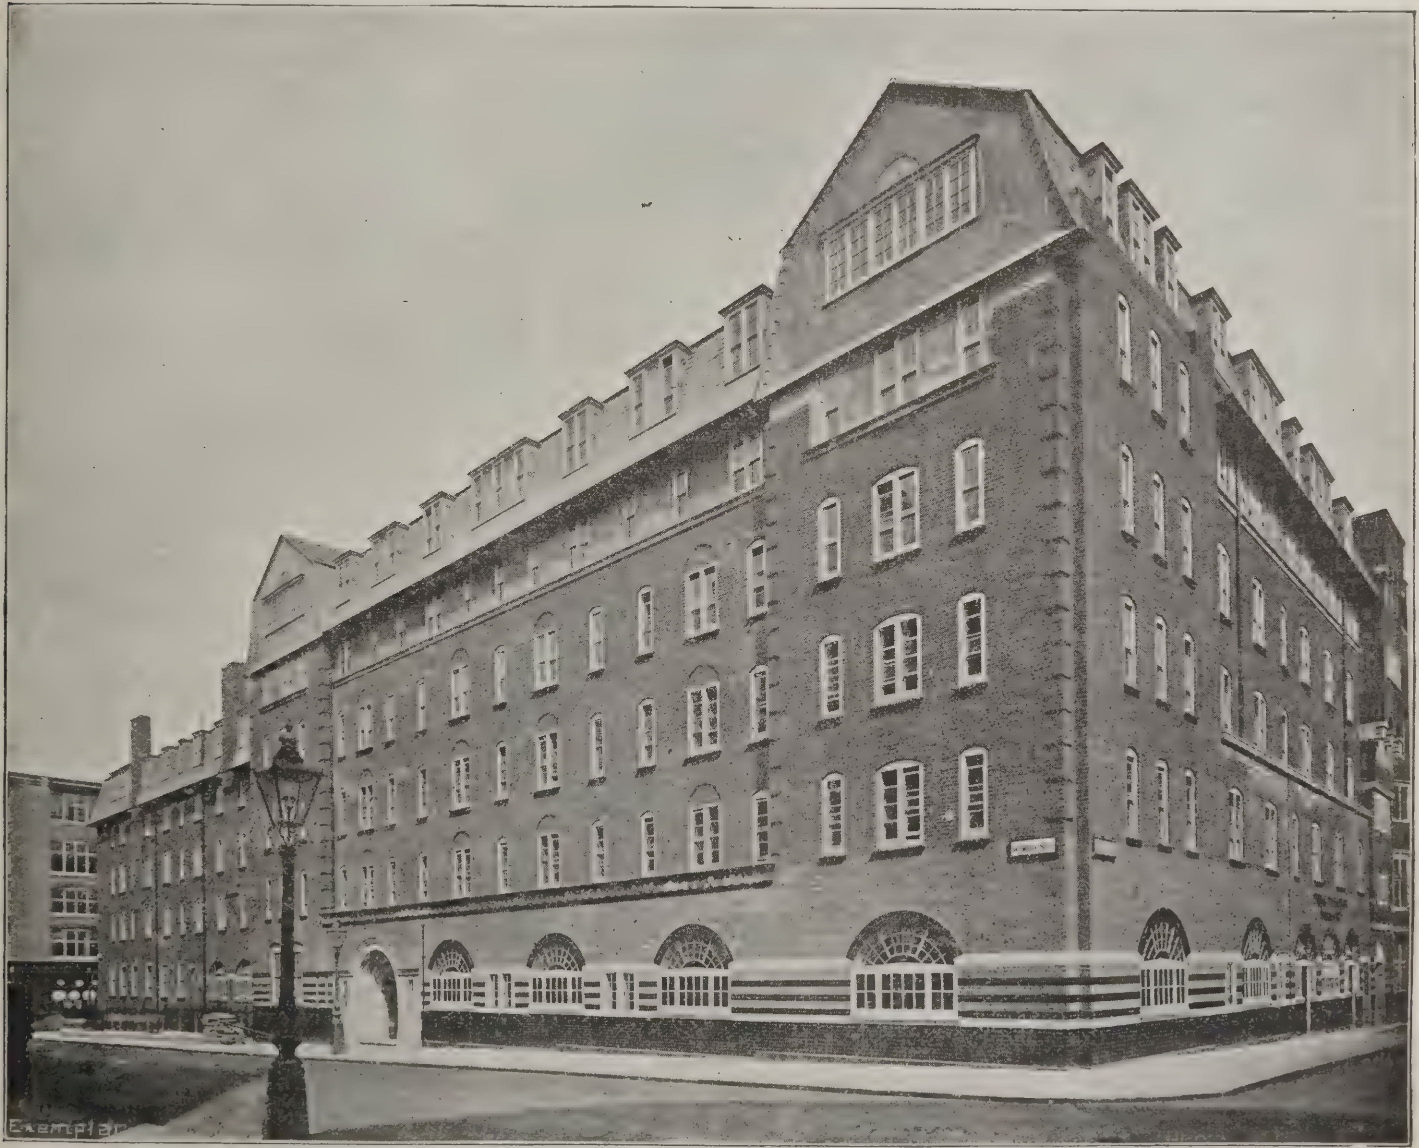
The plan of the building is E shaped above the ground floor, so arranged as to provide adequate light and air to the cubicles. The building is six storeys in height. The elevations are of red brick facings, relieved with glazed and Luton bricks, stonework and rough cast, and the roofs are covered with green slates.

The ground floor (lodgers' section) comprises spacious dining-room (including hot chamber and lodgers' crockery store), smoking-room, reading-room, writing-room, locker-room, parcels-room and w.c.'s, and urinals for the use of lodgers. The ground floor (administrative section), comprises office, superintendent's quarters, clerk's bedroom, female staff sitting-room, and bedrooms, porter's day-room and shop.

On the ground floor there is a room facing Kean Street, which it is proposed to let for commercial purposes.

The basement (lodgers' portion) comprises lavatory, feet-washing room, baths, dressing rooms, lodgers' washhouse, boot-brushing room, and barber's and boot-maker's shops. The basement (administrative portion) comprises establishment scullery, kitchen, bread and milk store, larder, crockery store, shop store, general store, bed-makers' day room, soiled linen room, clean linen room, establishment laundry (including drying chambers, one being set apart for mattresses), ironing-room, heating chambers and coal stores, and a disinfecting chamber.

The upper storeys, comprising 709 cubicles, have sanitary appliances on each floor.



BRUCE HOUSE, KEMBLE STREET, DRURY LANE, LONDON: FROM THE WEST CORNER.
W. E. RILEY, F.R.I.B.A., SUPERINTENDING ARCHITECT TO THE LONDON COUNTY COUNCIL

The surfaces of the walls in the principal corridors, staircases, lavatories, kitchens, cold stores, &c., have been finished in glazed bricks or tiles. The public rooms generally have dadoes of coloured tiles 7ft. 9in. high. The reading and writing room generally are provided with picture panels of prints, framed in teak. The smoking room has coloured pictures, similarly framed, and in the dining-room coloured tile pictures with tile frames are provided. The floors of the principal rooms are laid in wood blocks on concrete. The fireplaces to the reading and smoking rooms are designed in coloured glazed tiles, with Hopton wood stone dressings and mantel shelves. The floor and staircases throughout are of fire-resisting construction.

The charges that are made to lodgers' are 7d. per cubicle for one night only, and 6d. per night for lodgers taking weekly tickets. The payment for a bed-ticket carries with it the following privileges:—The use of the public rooms, library, daily papers, cooking utensils, crockery, etc., lavatory, feet-washing-room, lodgers' wash-house, boot-cleaning and dressing-rooms, lounge and promenade.

The catering for the lodgers' at present is being undertaken by the superintendent of the house, but the Council intend to seek authority from Parliament next session to take the catering into its own hands.

ST. MARK'S AT VENICE.

The work of restoration of the Basilica of St. Mark is proceeding with rapidity, but also with caution. The two vaults of the roof, called the Paradise and Apocalypse, which, because of their grave state, were a serious danger to the whole Basilica, are completely propped, so that they are now entirely safe, and the work is going on under the direction of Signor Manfredi, the architect, and Signor Marangoni, the engineer.

They are also personally attending to the strengthening and partial rebuilding of one of the four internal tribunes, that called the Patriarch, which has large cracks caused by the sinking of the foundations of the pillars which support it. This also was first propped, then with scrupulous care the Byzantine mosaics which adorn it were detached, as was done last year with the other Tribune of the Crucifix, which was in a similar condition. During the work on the Tribune of the Patriarch an important discovery has just been made.

In the cement which attached the mosaics to the wall a small coin of the Doge Dandolo was found, thus showing that at least part of the building of the Basilica took place in the glorious period of the Venetian Republic, between 1192 and 1205. It seems evident that the coin fell into the cement from the clothing of one of the workmen and remained there for seven centuries, as this is the first time that that mosaic has been removed since its original setting.

A new steel bridge over the Usk has been built, in the parish of Kemeys Commander, on the main road from Usk to Abergavenny, by Mr. George Palmer, of Neath, to the designs of Mr. J. J. Webster, M.Inst.C.E., of Westminster, at a cost of £7,000. Messrs. W. A. Baker & Co., Ltd., of Newport, executed the steelwork.

DANGEROUS WINCHESTER.

Further discoveries have been made of the unsatisfactory condition of the fabric of Winchester Cathedral. Immediately after one of the services last week a loud crash was heard in the building, and soon after it was discovered that the pointing of a joint in one of the ribs of the vaulted ceiling over the south aisle of the nave had fallen. The débris was composed of slate, brick, and oyster shells, which had been used as packing by the original builders. The immediate cause of the fall is believed to have been the concussion occasioned by the work of relaying the roof with lead, but examination showed that a serious weakness existed. The outer walls have been torn away from the vaulting, which has caused serious fractures in the spandrils of the roof. This points to either a settlement of the building or the thrust of the vaulting forcing the outer wall outwards. The outer wall is four inches out of the perpendicular to the height of 15ft. Temporary measures have been taken to meet the situation pending the reception of a report on the state of the south aisle by the Dean and Chapter. It is anticipated that the south wall will have to be underpinned and the whole of the pockets of the wall rebuilt. It is estimated that the cost of this work will be about £5,000. The work at the east end is progressing favourably.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, *Great New Street, Fetter Lane, E.C.*

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Beckenham.—For alterations and additions to Bromley Road Schools, for the Beckenham Education Committee:—

S. G. Gee, Mackenzie Road, Beckenham	£7,676	8	10
H. Heathfield, Beckenham	6,121	0	0
B. E. Nightingale, Albert Embankment	5,967	0	0
F. W. Green, Beckenham	5,893	10	0
Jones & Andrews	5,798	0	0
T. Crossley & Sons, Bromley	5,683	0	0
J. Lonsdale, Swanley Junction	5,651	0	0
F. & G. Foster, South Norwood	5,591	0	0
J. & E. Bowyer, Upper Norwood	5,555	0	0
Howky & Oldman, Mile End	5,465	0	0

Brigg.—For the erection of three dwelling-houses in Grammar School Road. Mr. W. H. Buttrick, architect, Home Street, Scunthorpe:—

F. Bilton	£1,554	11	0
C. Clark	1,377	15	0
J. Manders,* Barnetby	1,117	0	0

Architect's estimate, £1,100.

* Accepted.

Colwyn Bay.—For the erection of the new county buildings, for the Denbighshire Standing Joint Committee:—

R. J. Williams, Bangor	£11,355
R. and J. Williams, Bangor	11,355
Jones and Son, Liverpool	10,950
J. B. Jones and Son	10,200
Exors. of H. A. Clegg, Chester	10,055
W. Vernon and Sons, Chester	10,025
Brown and Backhaus, Liverpool	9,350
Davies Bros., Wrexham	8,970
R. Allen, Widnes	8,810
E. Jones and Sons, Groeslon	8,800
Buller Bros., Liverpool	8,748
J. T. Jones, Cefn	8,697
Holme and Green, Liverpool	8,595
R. Jones	8,022
Davies and Jones	7,980
R. L. Roberts, Llandudno	7,970
R. Evans and Son, Old Colwyn	7,909
Wood and Co.	7,685
J. Myers and Son, Chester	7,498
E. Thorp and Sons, Llandudnc	7,495
A. Emmett	7,400
H. Kelly and Co., Liverpool	7,297
Jones and Pritchard,* Abergele	5,900

*Accepted. [Rest of Colwyn Bay.]

Coventry.—For the erection of motor manufactory and office on the west side of Foleshill Road. Mr. F. Foster, architect, Masonic Buildings, Coventry. Quantities by the architect:—

B. W. Whitehouse & Son	£12,947	0	0
J. Worwood	12,845	0	0
Kelley & Son	12,355	3	0
C. Haywood	12,250	0	0
C. Griffiths	12,239	0	0
J. Parnell & Son	12,227	0	0
J. Isaacs & Sons	12,004	0	0
C. G. Hill	11,990	0	0

C. Garlick	11,690	0	0
R. & A. R. Cleaver	11,550	0	0
A. A. Wincott	11,526	0	0
W. H. Gibbs	11,475	0	0
E. Harris,* Coventry	11,450	0	0
W. Hopkins	11,300	0	0

* Accepted.

Cowes (I.W.)—For the reconstruction of shop, offices, and stores in Mill Hill Road, for Messrs. Henry Bannister and Co., rope manufacturers. Mr. J. W. Bessant, architect and surveyor, Pelham Road, Cowes, Isle of Wight:—

W. Barton & Co.	£1,087	10	0
H. E. Day	1,057	0	0
J. Meader	982	0	0
G. W. Ball,* Cowes	946	0	0

Architect's estimate, £901.

* Accepted.

Devonport.—For alterations and additions to 40 and 41, Fore Street (business premises), for Mr. F. Goodman. Mr. Edgar M. Leest, architect, 14, St. Aubyn Street, Devonport. Quantities by Messrs. Leest & Adams, Devonport:—

Wakeham, Bros.	£2,494
J. H. Palmer	2,390
T. May & Son	2,355
Pearce Bros.	2,297
A. N. Coles	2,297
Jenkin & Son	2,295
Pearn Bros.	2,254
H. J. Allen	2,024
S. Roberts,* Plymouth	1,950

* Accepted.

Eccles.—Accepted for the erection of the Carnegie Library, for the Corporation. Messrs. Potts, Sons, & Hennings, architects, Manchester:—

Hardman & Jones, Eccles £7,200

Headingly (near Leeds).—Accepted for the construction of new filter-beds, for the Leeds Waterworks Committee:—

C. Bushby & Sons, Darlington ... £31,705 4 10

Highley.—Accepted for additions to Council school, for Salop Education Committee. Messrs. Gething & Son, architects, Oxford Chambers, Kidderminster:—

C. Griffiths. Stourbridge £1,070

Hindhead (Surrey).—For the erection of new Council schools. Messrs. Jarvis & Richards, architects, 36, Victoria Street, S.W.

Complete List of Contracts Open.

WITH a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Aug. 2. Alnwick.—*Erection of new residence* at Alnwick for Wm. Percy, Esq. The plans and specifications may be seen of G. Reavell, Junr., Alnwick, and the tenders, duly endorsed, must reach him not later than noon, August 2.

Tenders must be in the form attached to the specification, and must be delivered to R. E. Fox, town clerk, Town Hall, Leeds, not later than 10 o'clock on August 15, in sealed envelopes endorsed, "Electric Lighting—Tender for Pipes, &c."

August 15. Barking Town.—*The construction of Light Railways* as follows for the Urban District Council. Contract No. 1, Rails, fishplates, and bolts. Do., No. 2, Permanent-way construction. Do., No. 3, Overhead line equipment. Persons tendering are at liberty to tender for any of the contracts or for all of the contracts, but not for part only of one Contract. Copies of the specification, with forms of tender and general conditions, may be obtained of H. Hargreaves, clerk to the Council, Public Offices, Barking Essex, on depositing a cheque for £5 5s. Applicants to state the contract for which they propose tendering. The works are to be carried out in accordance with the plans and specifications prepared by Hawtayne & Zeden, consulting engineers to the Council, 9, Queen Street Place, London, E.C., where plans may be seen and from whom further information can be obtained. Fair wages clause. Tenders, sealed and marked "Tender for Light Railways," to be addressed to the Chairman of the Electricity and Tramways Committee, Council Offices, Barking Town, and to be delivered to H. Hargreaves, on or before 12 o'clock noon on August 15.

September 4. Lancaster.—*Proposed re-construction of steam heating arrangements* and hot water service at County Lunatic Asylum, Lancaster. Tenders to be sent by September 4th (extended date) to J. T. Cheetham, clerk and steward.

IRON AND STEEL.

August 2. Ashford, Middlesex.—*Supply Delivery, and erection on their premises at Ashford, Middlesex, of the following plant and materials* for the Managers of West London District Schools. Contract No. 1.—Pipework and sundry apparatus for Exhaust Steam Heating System. Contract No. 2.—Pipe Trenches and sundry Builder's Work. Contract No. 3.—Chimney Shaft, Economiser Chamber, and Flues. Contract No. 4. —Two 50 kw. Steam Dynamos (high-speed D.A. vertical compound engines), and Boosters, an Electric Motor, Additions and Alterations to Switchboard, some 200 yds. of Cable, and sundry other work. Contract No. 5.—Alterations and extensions to Steam, Exhaust, Feed and Drain Pipes, a Green's Economiser, &c. Copies of the general conditions applicable to all the contracts, the specifications, drawings, and forms of tender may be obtained by application to F. G. Beeching, clerk to the managers, Ashford, Middlesex, at the schools, on payment of a deposit of £3 3s. for each section. Copies of the above-mentioned documents may be seen (but not obtained) at the offices of F. H. Medhurst & Lloyd, consulting engineers, 13, Victoria Street, Westminster, from whom all particulars of the work may be obtained. Persons tendering may inspect the schools on week-days, between the hours of 10 a.m. and 4 p.m. The tenders must be delivered to F. G. Beeching (as per instructions with the forms) not later than 6 p.m. on Thursday, Aug. 2.

August 7.—London, W.—*Supply of about 250 tons of steel bridge girders and other iron and steel work of British manufacture* for the Great Western Railway Co. Plans and specification may be seen and forms of tender and bills of quantities obtained at the office of the Engineer, at Paddington Station, London, between the hours of 10 a.m. and 4 p.m. Tenders addressed to G. K. Mills, secretary, Paddington Station, London, and marked outside "Tender for Girder Work," will be received on or before August 7.

August 7. Hemsworth.—*Supply of 1,982 lineal yards of cast-iron socketed water main pipes*, 3in. diameter, for the Rural District Council, also for the cutting and filling of trenches and the laying and jointing of about 1,982 lineal yards of 3in. cast-iron water mains at Thorpe Audlin, near Pontefract. Plan, etc., may be seen at the office of T. H. Richardson, surveyor, Hemsworth, from whom further particulars may be obtained. Tenders are to be sent to J. Scholefield, clerk to the Council, Hemsworth, near Wakefield, not later than August 7.

August 8. London, W.—*Iron staircase verandahs, &c.*, to be erected at new buildings now in progress at Isleworth. Plans and specifications can be seen of W. Stephens, clerk to the Guardians, Union Offices, Isleworth, W., or at the office of W. H. Ward, architect, Paradise Street, Birmingham, who will explain every particular and detail. Tenders must reach W. Stephens not later than 10 a.m. on August 8.

August 20. London, S.W.—*Supply. delivery, and erection complete, at the depot Queen's Road, Wimbledon, of a cart shed*, about 165ft. long by 30ft. span, with open sides, and consisting of galvanised corrugated iron roofing, steel roof trusses, and rolled steel stanchions, for the Corporation of Wimbledon. Detailed plans and specification may be inspected and forms of tender obtained on application to the Borough Engineer and Surveyor, Town Hall, Wimbledon. Sealed tenders, on the forms and enclosed in the envelopes provided, to be delivered at the Town Hall on or before noon on August 20.

No date. Brithdir.—*30 yards unclimable wrought iron fencing*, not under 4ft. 6in. high. Jones, 24, Station Terrace, Brithdir, *viâ* Cardiff.

PAINTING AND PLUMBING.

August 2. Manchester.—*Painting required at Ardwick Green, Birch Fields, Cheetham, Gorton, Bradford and Whitworth Parks* for the Parks Committee. Specifications may be obtained at the City Architect's office, Town Hall, upon payment of £1 1s. each. Separate sealed tenders, enclosed in the official envelopes, to be delivered at the above office not later than 9 a.m. on August 2.

August 2. Hastings.—*Painting, lime-washing, repairs, &c., at West St. Leonards Council School during the summer holidays* for the Education Committee. Specifications may be seen at the office of the borough surveyor, Town Hall, Hastings. Tenders to be sent to P. O. Buswell, Clerk of the Committee, 18, Wellington Square, Hastings, not later than noon on August 2, endorsed "Painting, &c., West St. Leonards School."

August 2. Derby.—1.—*Cleaning and Painting Stations, &c.*, at Montpelier, Redland, Clifton Down, Hotwells, Shirehampton, and Avonmouth. 2.—Cleaning and Painting Signal Works, St. Mary's Goods Depot, and Chaddesden Sidings, Derby, for the directors of the Midland Railway. Specifications may be seen, quantities and particulars obtained, on application at the Engineer's Offices, at Derby. Sealed tenders to be forwarded by post to the Secretary of the Way and Works Committee, Midland Railway, Derby, not later than 9 a.m. on August 2.

August 3. Nottingham.—*Taking out the old fittings and supplying and fixing new urinal fittings* and making other alterations to the existing urinals at Derby Road and Commercial Square, St. Ann's Well Road; plans may be seen and specifications and forms of tender obtained from F. B. Lewis, city architect, Guildhall, on payment of a deposit of £1 1s.; fair wages clause; sealed tenders to be delivered to S. G. Johnson, town clerk, Guildhall, Nottingham, at or before 10 a.m. on August 3, 1906.

August 4. Preston.—*Painting of the outside of Workhouse at Fulwood.* Copies of the specification may be obtained from J. Clarke, clerk to the Guardians, Union Offices, Preston, upon deposit of £1, and tenders, endorsed "Tender for Painting," should be sent to J. Clarke not later than August 4.

August 7. Cardiff.—*Painting and renovating East Moors, Roath, and Cathays Police Stations.* Copies of specification and form of tender may be obtained at the office of W. Harpur, M.Inst.C.E., City Engineer, Town Hall. Sealed tenders, endorsed "Painting Police Stations," to be sent to J. L. Wheatley, Town Clerk, Town Hall, Cardiff, on or before August 7.

ROADS AND CARTAGE.

August 4. Saffron Walden.—*Supply and delivery at Saffron Walden Railway Station of about 450 tons of granite macadam*, broken to 1¾in. gauge, for the Borough Corporation. To be delivered in such quantities as may be required before March 31, 1907. Samples of granite, with tender, to be delivered to A. H. Forbes, borough surveyor, not later than 12 o'clock on August 4.

August 4. Faversham.—*Supply of 970 tons (more or less) of Cornish granite or Rhenish basalt* broken to a 2-in. gauge, and of 130 tons (more or less) of clean ½-in. Guernsey granite, Cornish granite, or Rhenish basalt chippings free from dust. The material is to be delivered on to the Town Wharf, Faversham, in accordance with the rules and regulations of the wharf, or into carts or trucks, as may be directed by the Borough Surveyor. The whole of the material is to be delivered in such quantities and in such times not later than December 25, 1906, as may be ordered by the Borough Surveyor. Tenders must be accompanied by a sample of each material tendered for, and will not be considered unless so accompanied. Tenders, in sealed envelopes, endorsed "Tender for Road Metal," must be sent to A. Tassell, town clerk, 20, West Street, Faversham, not later than 12 o'clock noon on August 4.

August 6. Armagh.—*Laying a concrete footpath in the new street off Banbrook Hill*, to be known as Little Patrick Street, for the Urban District Council. The approximate quantities are—Kerbing 270ft., Channelling, 270ft., Concreting, 90 sq. yds. The specification can be seen at the office of the town clerk, Tontine, Armagh, on any week-day between 10 a.m. and 2. p.m. Tenders to be addressed to "The Chairman, Urban District Council," and to be delivered to J. Lennon, Clerk of the Council, Armagh, not later than 12 noon on August 6.

August 7. Horsham.—*Hire of steam roller with scarifier*, to commence work about October next. Further particulars and forms of tender may be obtained of W. Dengate, surveyor, 58, Park Street, Horsham. Sealed tenders, marked "Steam rolling," must reach A. C. Coole, clerk, 9, Carfox, Horsham, on or before August 7.

August 7. Manchester.—*Making up Manley Road, Whalley Range; Longford Road, Chorlton-cum-Hardy; Ellesmere Road, Chorlton-cum-Hardy: Chatsworth Road, Chorlton-cum-Hardy: Passage alongside Cheshire Lines Railway; Chorlton-cum-Hardy.* Plans, sections and specifications of the work can be seen, and a form of tender with quantities and any further information obtained from the Surveyor to the Committee, Town Hall, West Didsbury. Tenders to be endorsed "Tenders for Street Works," and to be addressed to the Chairman of the Withington Committee, Town Hall, West Didsbury, not later than noon on August 7.

August 8. London, N.—*Formation of new road at Muswell Hill.* Plans and sections can be seen and copies of specification obtained upon personal application to Vigers & Co., 4, Frederick's Place, Old Jewry, E.C. Tenders to be delivered to C. J. Hayter, 84, Temple Chambers, Temple Avenue, E.C., before two o'clock on August 8.

August 11. South Shields.—*Constructional work and paving thereto for the carrying out of the permanent way and track*, including steel rails, points, crossings and other auxiliary work for the Boldon Lane and Hudson Street Extension of the South Shields Corporation Tramways, 3 furs. 1·20 chs. double lines, equal to about 6 furs. 2·40 chs. single track for the Tramways Committee. Copies of the specification and quantities, including conditions and form of tender, and also forms of contract can be obtained, and the general and detail drawings seen, at the office of S. E. Burgess, M.Inst.C.E., borough engineer and surveyor, Chapter Row, from whom all further information may be obtained. Tenders, on forms supplied, sealed and endorsed "Tender for Tramways Permanent Way, Boldon Lane Extension," must be delivered to J. M. Hayton, Court Buildings, South Shields, on or before 12 noon, on August 11.

SANITARY.

August 8. Buglawton.—*Construction of about 1,965 yards of 6in., 9in., and 12in. pipe sewers*, with the necessary manholes, lampholes, ventilating shafts, and other works connected therewith, for the Urban District Council. Drawings and specifications may be seen, and bills of quantities and form of tender and all information obtained at the office of C. Russell Hall, engineer and surveyor, Chapel Street, Congleton, on payment of £5 5s. for each contract. Sealed tenders, endorsed "Sewerage Works," to be delivered to A. Andrew, clerk, Wagg Street, Congleton, not later than August 8.

August 8. Portsmouth.—*Construction of sewers, manholes, pumping station, attendant's cottage and all accessories* in Copnor Road, in the borough of Portsmouth, together with Crossley's gas engines and centrifugal pumps. On payment of the sum of £5, a lithographed copy of the specification, general conditions, and bill of quantities, together with form of tender, can be obtained on application to A. Hellard, town clerk, Town Hall, Portsmouth, and any further particulars can be obtained at the Borough Engineer's office, at the Town Hall, Portsmouth. Tenders, marked "Tender for Copnal Road Sewer and Pumping Station," must be filled up, signed and returned, with the bill of quantities duly filled in, to the Town Clerk, not later than 10 a.m., on August 8. Fair wages clause.

August 8. Bedlington.—*Execution of the following sewerage work* for the Urban District Council. Tenders are invited for the construction of the following lengths of sewers, inclusive of manholes, gullies, connections, and other works: 1,288 yards lineal 18-in. earthenware pipe sewer; 161 yards lineal 15-in. earthenware pipe sewer; 72 yards lineal 12-in. earthen ware pipe sewer; 27 yards lineal 9-in. earthenware pipe sewer; 91 yards lineal 18-in. cast-iron outlet pipe sewer. Drawings and specifications may be seen, and quantities, forms of tenders, and all other particulars obtained by appointment at the office of J. E. Johnston, surveyor to the Council, Front Street, Bedlington. Sealed tenders, endorsed "Tender for Sewer, Bedlington Bank Top," to be sent to C. D. Forster, Clerk's Office, 24, Grainger Street West, Newcastle-on-Tyne, on or before 9 a.m. on August 8.

August 13. Bollington.—*Construction of the sewerage of Kerridge* for the Urban District Council. The works comprise about 1,853 yards of 7-in. and 8-in. stoneware pipe sewers, together with manholes, lampholes, and other appurtenant works. Plans may be seen and quantities and form of tender may be obtained at the office of W. H, Radford, C.E,, engineer, Albion Chambers, King Street, Nottingham, on deposit of £2 2s. A copy of the plans may also be seen at the office of S. Knight, clerk, Council Offices, Bollington. Sealed and endorsed tenders to be sent in to S. Knight on or before August 13

August 14. Spain.—*Execution of drainage works*, in accordance with conditions set forth in the "Gaceta," at the upset price of 102,907 pesetas (about £3,690). A deposit of 5,145 pesetas (about £184) is required to qualify any tender. Tenders will be opened on August 14 at the "Casa Consistorial, 5 Plaza de la Villa, Madrid."

August 17. High Wycombe.—*Refuse destructor.* Forms of tender, conditions, and plan of site may be obtained on deposit of £2. Tenders, sealed, endorsed "Destructor," and addressed to Chairman of Destructor Committee, to be delivered to I. J. Rushbrooke, borough surveyor and waterworks engineer, 77, Easton Street, High Wycombe, not later than noon on August 17

MISCELLANEOUS.

New London Buildings

AT yesterday's meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics* :—

Erection of a projecting one-storey shop in front of No. 149, High Street, Lewisham, on the application of Mr. L. Jacob, on behalf of Mr. J. Jacobs. *(Consent.)*

Erection of an addition at No. 3, Acacia Road, St. John's Wood, on the application of Mr. W. R. Phillips, on behalf of Mr. J. M. Swan, R.A. *(Consent.)*

Erection of a crane of the "cathead" type, over the public way at the front of No. 71, Dean Street, Oxford Street, on the application of Mr. E. K. Purchase. *(Consent.)*

Erection of a projecting clock in front of the Lyceum Tavern, No. 354, Strand, on the application of Messrs. Brown and Barrow, on behalf of Messrs. Henekey. *(Consent.)*

Erection of a house on the north-western side of Chillerton Road, Tooting, to abut upon Back Lane, on the application of Mr. H. Bignold, on behalf of Mr. F. Hooper. *(Consent.)*

Erection of buildings on the south-eastern side of Clarence Road, Clapham Park, Clapham, on the application of Messrs. Ronald, Day & West, on behalf of Mr. A. G. Taylor. *(Refusal.)*

Erection of two porches in front of a proposed block of buildings between Nos. 18 and 20, Cavendish Square, St. Marylebone, on the application of Messrs. Gilbert and Constanduros. *(Consent.)*

Erection of projecting one-storey shops in front of Nos. 38 and 39, Chapel Street, Pentonville, on the application of Messrs. T. H. & A. M. Watson, on behalf of Mr. T. W. Dobson. *(Consent.)*

Erection of an oriel window at No. 60, Fenchurch Street, City, to abut upon Fenchurch Street and London Street, on the application of Mr. J. S. Gibson, on behalf of Mr. J. Carmichael. *(Consent.)*

Erection of a projecting oriel with balcony over in front of a proposed building on the site of No. 20, Warwick Street, Strand, on the application of Mr. J. N. R. Vining on behalf of Messrs. Liberty & Co. *(Consent.)*

Erection of porches and bargeboards in front thirteen houses in Rosendale Road, and six houses in Dalkeith Road, Wandsworth, on the application of Mr. C. M. Quilter, on behalf of Mr. S. Admans. *(Consent.)*

Alteration and rebuilding of workshops at the rear of No. 20, 22 and 24 Cyrus Street, Clerkenwell, on the application of Major C. E. Dance, on behalf of the Marquess of Northampton. *(Consent.)*

Erection of four dwelling-houses on low-lying land facing Ordnance Road, East Greenwich, on the application of Mr. Alfred Roberts, on behalf of Mrs. Colwell. *(Consent.)*

Erection of a dwelling-house and office on low-lying land at Dudgeon's Wharf, Manchester Road, Cubitt Town, on the application of Messrs. Frederick and T. Thorne. *(Consent.)*

Erection of a building to be known as the Piccadilly Hotel, to abut upon Piccadilly, Piccadilly Place, Vine Street, Regent Street and Air Street, on the application of Messrs. W. Woodward and W. Emden. *(Consent.)*

Erection of buildings abutting upon the new street, from Southampton Row, Holborn, to Vernon Place, on the application of Mr. R. J. Worley, on behalf of the Selected London Properties Company. *(Consent.)*

Formation or laying out of a new street for carriage traffic in continuation eastward of Jeddo Road, Hammersmith, on the application of Mr. H. Mair, on behalf of the Hammersmith Metropolitan Borough Council. *(Consent.)*

Construction of a generating station and works on the north-west side of Blackwall Lane, Greenwich, on the application of Messrs. Babcock & Willcox, on behalf of the South Metropolitan Electric Light and Power Company. *(Consent.)*

Erection of buildings with projecting shop fronts, bay-windows and balconies upon the site of Nos. 418 to 421, Strand, to abut upon the Strand and Exchange Court, on the application of Messrs. Crickmay and Sons. *(Consent.)*

Erection of a manual training centre at the Council's Westminster Bridge Road schools, to abut upon Westminster Bridge Road, on the application of Mr. T. J. Bailey, on behalf of the Education Committee of the Council. *(Consent.)*

Erection of five blocks of cottages and shops (section "C") on the southern side of Franciscan Road, Totterdown, on the application of Mr. R. Robertson, on behalf of the Housing of the Working Classes Committee of the Council. *(Consent.)*

Erection of buildings on the eastern side of Hoxton Street, Hoxton, at less than the prescribed distance from the centres of the roadways of Hoxton Street and Drysdale Street, on the application of Mr. G. H. Lovegrove, on behalf of Messrs. Yapp & Co. *(Refusal.)*

Erection of a projecting stone balcony on the Welbeck Street frontage of a building abutting upon Wigmore Street and Welbeck Street, St. Marylebone, on the application of Messrs. Wallace and Gibson, on behalf of Messrs. Debenham, Limited. *(Consent.)*

Formation or laying out of two new streets for carriage traffic on the Page estate, Eltham, Woolwich, and in connection therewith the widening of a portion of Well Hall Road, on the application of Messrs. D. Watney & Sons on behalf of Mr. C. H. Polhill. *(Consent.)*

Formation or laying out of a new street for carriage traffic to lead out of the western side of Wilton Road West, Hammersmith, so far as relates to the portion of such street as will be within the boundary of the County of London, on the application of Messrs. Weatherall & Green, on behalf of Major Cowper Essex. *(Consent.)*

Modification of the provisions of that section with regard to open spaces about buildings, so far as relates to the proposed erection of a building on the southern side of Marius Road, Tooting, with an irregular open space at the rear, on the application of Mr. H. Bignold, on behalf of Mr. F. Priddis. *(Consent.)*

Covering in of a portion of the yard at the Motor Bus Garage, Shrubland Road, Hackney, on the application of Messrs. F. Boreham & Son, on behalf of the Motor Bus Company, Limited, whereby an existing workshop building at such garage premises will be made to exceed in extent 250,000, but not 450,000 cubic feet. *(Consent.)*

Deviation from the plan for the erection of buildings on the southern side of Lower Road, Rotherhithe, opposite Neptune Street, so far as relates to the retention of a building and the erection of an addition thereto, in advance of the line approved on July 31st, 1905, on the application of Messrs. Newman & Newman, on behalf of the Guardians of the Parish of Bermondsey. *(Consent.)*

Erection of blocks 26 and 27, on the Totterdown Fields Estate, Tooting, to abut upon Blakenham Road, Coteford Street and Cowick Road, and also a variation in the forecourt boundary of block 27 where such forecourt boundary abuts upon Blakenham Road, on the application of Mr. R. Robertson, on behalf of the Housing of the Working Classes Committee of the Council. *(Consent)*

Erection of three dwelling houses to abut upon Claremont Place and Wells Tenements, Rotherhithe, within 20ft. from the centre of the roadway of Claremont Place, and exceeding in height the width of such street, and with boundary fences at less than the prescribed distance from the centres of the roadways of the said streets, on the application of Messrs. Stock, Page & Stock, on behalf of the Gomm estate and Messrs. Bisley & Sons. *(Consent.)*

Erection of porches and projecting eaves to a new wing to the Fulham Waste Lands and Lygon Almshouses, Fulham Palace Road, Fulham, on the application of Mr. E. Avern, on behalf of the trustees of the almshouses. *(Consent.)*

Erection of an enclosed iron and concrete gangway across King John's Court, Wood's Buildings, Great Eastern Street, Hoxton, on the application of Mr. T. H. Smith, on behalf of Messrs. Brown Brothers. The Council will be prepared to consider an amended application, accompanied by the necessary plans, showing the gangway to have open sides with balustrading not less than 3ft. 6in. in height. *(Refusal.)*

Deviation from the plans for the formation or laying out of a new street for carriage traffic to lead from Carpenter's Road to Homerton Road, Hackney Wick, so far as relates to an alteration in the levels of a portion of such road, on the application of Messrs. Deakin & Cameron, on behalf of the trustees of the late Viscount Eversley and the trustees of the late Major Clayton. *(Consent.)*

Deviation from the plans approved on 26th July, 1898, in connection with the rebuilding of Nos. 116 to 132 (even numbers only), Oxford Street, and Nos. 1 to 5, Wells Street, St. Marylebone, so far as relates to the erection of a first storey addition at the rear of No. 122, Oxford Street, and the erection of a gangway to connect the flat roof of such addition with Nos. 68 to 70, Berners Street, on the application of Mr. J. Slater, on behalf of Messrs. Bourne and Hollingsworth. *(Consent.)*

The Theatre and Music Hall Committee also reported the following :—

Drawings submitted by Messrs. Field & Sons showing certain alterations which have been carried out at the Surrey Vaudeville Theatre, Blackfriars Road. *(Consent.)*

Sketch plans submitted by Messrs. E. Runtz & Ford, on behalf of Mr. John Waring, of a new concert-hall proposed to be erected to front on Oxford Street, Dering Street and Tenterden Street. *(Refusal.)*

Drawing, submitted by Mr. A. O. Collard, showing the reconstruction of the existing wooden stairs and bridge over the railway between the Queen's Palace and the Central Hall at the London Exhibitions, Earl's Court. *(Consent.)*

Drawings submitted by Mr. I. Ibbetson and Mr. H. Tozer showing the alterations proposed to be effected at the Tivoli Music Hall, Strand, with a view to complying with certain of the suggestions made by the Council for the structural improvement of the premises. *(Consent.)*

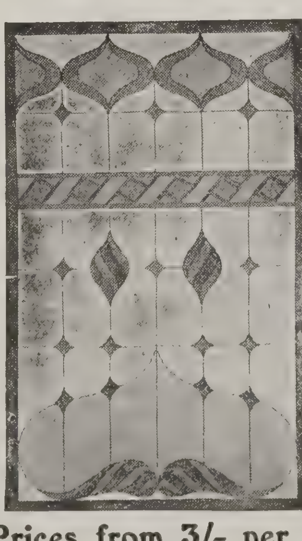
Drawings, submitted by Mr. E. White, on behalf of Mr. Imre Kiralfy, of certain buildings to be erected in connection with the British Empire Exhibition, which it is proposed to lay out on a site about 82 acres in extent, situated on the west side of Wood Lane, Hammersmith. *(Consent.)*

Drawing, submitted by Mr. J. Jeffrey, showing three pairs of swing doors and a pass door which it is proposed to provide in the Upper Street entrance to the Royal Agricultural Hall, Islington, in lieu of the existing iron gates. *(Consent.)*

Drawings submitted by Messrs. J. E. K. & J. P. Cutts, showing the arrangement of a building to be known as the St. Michael's Parish Hall, which it is proposed to erect at Ullin Street, Bromley-by-Bow, and in respect of which it is intended to apply for a music and dancing licence. *(Consent.)*

Drawings, submitted by Mr. A. Moul, showing the alterations proposed to be carried out at the Alhambra Palace of Varieties, Charing Cross Road, with a viewt o complying with certain of the suggestions made by the Council in November, 1905, for the structural improvement of these premises. *(Consent.)*

"CLOISONNE GLASS"
WEATHER RESISTING.
Production 1905—25,000 square feet.



The CLOISONNE GLASS CO.
40E Berners St., Oxford St., London, W.
Branch Office:— 23, Old Queen Street, Westminster, S.W.
Prices from 3/- per square foot.
CATALOGUE SHOWING 250 DESIGNS ON APPLICATION.

Bankruptcies.

Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—adjudication.

During the week ending July 27th twenty-nine failures in the building and timber trades in England and Wales were gazetted.

A. Wright, late builder, Yarmouth. Liabilities, £406.

S. Booth, builders' merchant, Stockton Heath (late trading as the Peerless Patents Co.). P.E., Warrington C.C., Aug. 3, at 11. Adj., July 18.

W. Meadows, builder, Charlton and Greenwich. P.E., Greenwich C.C., Aug. 7, at 1. Adj., July 17.

P. Carroll, builder and contractor, Liverpool. R.O., July 17.

H. Taylor, engineer, Barrow-in-Furness. First meeting, O.R.'s, Barrow-in-Furness, Aug. 3, at 11.30. P.E., Magistrates' Court, Barrow-in-Furness, Aug. 3, at 3.

E. Turner, painter and decorator, Blackburn. R.O., July 21.

Coad Brothers, builders, Finchley. R.O., July 18.

Willis & Crouch, surveyors, London. E.C. Adj., July 16.

Moir & Co., timber merchants, London, E.C., and Broxbourne. P.E., Bankruptcy Court, Sept. 4, at 11. R.O., July 19.

D. Charles, builder and haulier, Llantarnam. P.E., Town Hall, Newport, Aug. 9, at 11.

G. Williams, late builder, Blaina. P.E., Tredegar C.C., Aug. 10, at 10,45.

A. Gray, builder and contractor, late North Gosforth and Wideopen. P.E., Newcastle-on-Tyne C.C., Aug. 9, at 11. R.O., July 16.

F. Richards, builder, Wolverhampton. First meeting, O.R.'s, Wolverhampton, Aug. 3, at 11.30. P.E., Wolverhampton C.C., Aug. 15, at 11. R.O., July 16. Gross liabilities, £347; deficiency, £54.

G. How, builder, East Sheen. P.E., Wandsworth C.C., Aug. 2, at 12.

Burgess Brothers, builders, Westbury. First meeting, O.R.s, Bristol, Aug, 1, at 11.30. P.E., Mechanics' Hall, Frome, Aug. 10, at 11.30.

Brett & Co., painters and decorators, Armley. First meeting, O.R.'s, Leeds, Aug. 1, at 11.30. P.E., Leeds C.C., Aug. 28, at 11. R.O., July 20.

W. R. Harrison, consulting engineer, Hull. P.E,. Hull C.C.. Sept. 24, at 2.

W. W. Lloyd, plumber and painter, Prestatyn. First meeting, Crypt Chambers, Chester, Aug. 1, at 12. P.E., Magistrates' Room, Bangor, Sept. 6, at 12.30 R.O., July 16.

T. Williams, builder, Llwynpia. First meeting, 135, High Street, Merthyr Tydfil, Aug. 1, at 12. P.E., Pontypridd C.C., Aug. 21, at 11.15. R.O., July 16.

T. Ridgway, builder, Lichfield. Deficiency, £332.

F. A. Simons, builders' merchant, Gravelly Hill Liabilities, £852; deficiency, £717.

T. R. Lightburn & W. Lightburn, builders and contractors, Benton. Gross liabilities, £2,766; net assets, £379; deficiency, £594.

Coming Events.

Wednesday and Thursday, August 1 and 2.

North of England Institute of Mining and Mechanical Engineers.—Excursion Meeting at Newcastle-on-Tyne.

Saturday, August 4.

North of England Institute of Mining and Mechanical Engineers, Newcastle-on-Tyne.—Annual Meeting at 2 p.m.

Saturday, August 11.

Northern Architectural Association.—Students' Sketching Club Excursion.

Monday to Saturday, August 13-18.

Architectural Association.—Annual Excursion.

Saturday, August 18.

Northern Architectural Association.—Visit to the Medical College and New Grammar School, Newcastle-on-Tyne.

FIRE SUPPLEMENT (MONTHLY).

REINFORCED CONCRETE AS A FIRE RESISTANT.

In our previous issue we referred to the resolutions of the International Fire Congress at Milan, which so clearly point to the fact that when reinforced concrete is intended to be fire-resisting it is necessary to observe special precautions as to the nature of the aggregate used, the size of the aggregate, the fineness of the cement and the thickness of the protective covering to the steel.

We regret that it has not yet been sufficiently recognised by those who design works in reinforced concrete that the material is not *ipso facto* to be classed as a fire resistant, but only when certain precautionary measures have been observed. Reinforced concrete with metal work only protected, say, to the extent of half-an-inch, with an unsuitable aggregate, is distinctly dangerous, and the danger is accentuated by the fact that, seeing that the materials used are incombustible, all too great a confidence is placed in them.

At the seventh International Congress of Architects, just closed, the subject of reinforced concrete was before one of the meetings, and here also a resolution was passed which pointed to the necessity of giving attention to the question of aggregate, the size of the aggregate and the thickness of the protection, where reinforced concrete is intended to be used as a fire resistant.

The two resolutions combined—namely, that of the fire service and that of the architectural profession—now together put the position so plainly that it should not be any longer overlooked by architects and engineers in practice.

The specialist in reinforced concrete—*i.e.*, the contractor—should be pleased at this pronouncement, for he has now something to go upon when he advises his employer to allow him to put on the additional thickness of material and utilise better aggregates. Of course, these precautionary measures mean some additional expense, but reinforced concrete is so much cheaper than ordinary forms of construction in buildings of the warehouse class that the additional percentage is scarcely appreciable.

The meeting was really intended to consider both the values of steel frame construction and reinforced concrete, but steel frame building was practically not touched upon. This is regrettable, as it would have been interesting to have had some pronouncement as to the value of protective materials as applied to steel frame construction, the San Francisco lessons having again been very much in favour of concrete.

In the current issue we publish a paper by Mr. James Sheppard, A.I.E.E., chief surveyor to the North British and Mercantile Insurance Co. This paper, we should add, received primary attention at the Milan Congress, being a subject to which great consideration is being accorded at the present moment by all interested in questions of fire protection. It was illustrated by a special series of lantern slides arranged in a most systematic way and taken from photographs and drawings published in the reports of the British Fire Prevention Committee. It is only to be hoped that these interesting slides may some day also be presented in the Metropolis on the occasion of some evening meeting, as they are quite unique and give a most excellent picture of the relative values of different forms of protection.

FIRE-RESISTANCE OF BUILDINGS CONSTRUCTED WITH REINFORCED CONCRETE.*

By James Sheppard, A.I.E.E.

Importance of Being Able to Attack Fire at Close Quarters.

All practical fire fighters will, in view of their own experiences, unanimously agree that the fullest success in fire-fighting can only be secured by vigorous attacks at close quarters inside the burning building.

Unless in some measure such close attacks on the discovery of a fire can be made, with ample volume of water at efficient pressure, the building involved, especially if of large extent, will probably, with its contents, be destroyed, and the prevention of the spread of fire to the surrounding property may become both difficult and dangerous. Buildings erected and fitted to guard against these dangers have lamentably failed under the test of actual fires, chiefly owing to non-compliance with conditions obviously necessary to secure success.

Nature of Buildings needed to assist Firemen.

To avoid such disasters, buildings effectually separated into compartments of moderate extent, planned without unprotected floor openings and constructed so as to give ready and secure access for firemen to every part, for the longest period of time possible after an outbreak of fire, are required both in the interest of the public and of the chief officers of fire brigades and salvage corps and the men under their command.

Buildings constructed with reinforced concrete, this concrete being properly prepared with suitable aggregated sand and cement, and ample thickness being continued in front of all metal rods or net work, will satisfactorily meet these requirements if the conditions as to extent and other provisions referred to are duly observed.

Danger of so-called "Fireproof" Buildings having Structural Metalwork Unprotected.

Experience has repeatedly proved that large buildings constructed with incombustible materials only, but without due protection against the inevitable action of heat, fire and water on the metal and other materials used, although called "fireproof," are during the burning of their contents of a most treacherous and dangerous character, defying all reliable calculations as to the time and manner of their certain collapse. Responsible officers therefore very properly hesitate to send men into or even close to such buildings after any portion may be well alight, and frequently structures of this nature are unavoidably left to their fate.

Responsibility of Architects and Engineers.

Why architects and engineers continue to waste their clients' money on the erection of dangerous buildings of this character and proclaim them "fireproof" is a mystery which firemen fail to comprehend. It cannot be too strongly asserted that it is false economy of the worst description to omit efficient protection against the action of fire for all structural metal work used in important warehouse and factory buildings.

Slow-burning Buildings.

In view of the experience referred to in the case of buildings constructed with unprotected metal columns and girders, the use of timber in posts and beams of large scantling with thick plank floors, made air and water tight, have been extensively employed with considerable advantage, especially where protected with an efficient system of automatic sprinklers. Further advantage would be secured if the timber used were made thoroughly and permanently flameproof, but effective processes with this object appear at present to be too costly for general use.

Reinforced Concrete Construction.

The term "reinforced concrete" is used to describe systems of construction in which iron or steel in the form of rods, bars or net work is embedded in concrete both horizontally and vertically so as to take all tensional strain and offer resistance to shear, leaving the concrete to resist compression, thus uniting both materials, so that each is applied to the best advantage.

Previous methods of fire-resisting and slow-burning construction, especially for warehouses, trade and manufacturing premises, are now rapidly giving place to reinforced concrete systems, used either alone or in combination with hollow reinforced concrete or porous terra-cotta blocks. These systems, it is hoped, will enable architects and engineers to meet conditions necessary to obtain resistance to fire.

Reinforced concrete is claimed by its advocates to be a new structural material, but this can only be conceded so long as normal conditions continue, which many users of these new structural methods appear to consider will always be the case, and therefore make no provision against possible, if not probable, changes resulting from fire amongst the goods stored in buildings of this construction.

The materials employed in reinforced concrete acquire no new fire-resisting qualities, and although they may be made effectively to assist each other in this respect and offer every facility for providing buildings of the character needed in the interest of the public and of firemen before mentioned, it is necessary, to secure such qualities, duly to consider and provide against the effect of heat, fire and water on the materials employed, using only materials and methods proved from actual experience under various known conditions to be effective. This is equally necessary with reinforced concrete systems as with other methods of construction, if satisfactory resistance to fire is expected and the avoidance of disasters that have occurred with other systems desired.

---

* A paper read before the recent International Fire Congress at Milan.

Building Codes and Fire Insurance Regulations on Reinforced Concrete.

The City of New York Building Code, 1901, provides that all systems of floor construction used in buildings required to be "fireproof" shall be submitted to an official test for four hours under a distributed load of 150lbs. per sq. ft., placed on bays 4ft. wide between steel beams 10ins. deep, weighing 25lbs. per ft. run, having a clear span of 14ft., these beams being protected in the manner adopted by the system under test; the temperature to average not less than 1,700° Fahr. for the whole period of the test.

At the end of this four hours' heat test a stream of water through a 1⅛in. nozzle under 60lbs. pressure to be applied to the underside of the floor for five minutes; the top of the floor to be then flooded with water under low pressure, and the stream from the 1⅛in. nozzle under 60lbs. pressure again applied to the underside of the floor for a further five minutes.

A load of 600lbs. per sq. ft. to be then placed between the beams equally distributed.

If during these tests any flame has passed or any part of the load has fallen through, or if the maximum deflection of the beams, having a clear span of 14ft., exceeds 2½ins., the use of the system is prohibited in any building required to be "fireproof." Similar test regulations are also applied to partitions.

The materials used, the method of application and workmanship employed in the structure under test, constitute the standard for the system when used in actual building.

The American National Board of Fire Underwriters, in their carefully considered Building Code, recommend that the thickness of protecting concrete for all important metal members in columns and beams of reinforced concrete should be not less than 4ins.

The Fire Offices' Committee of the United Kingdom require that for "standard fire-resisting buildings" constructed with reinforced concrete the aggregates and Portland cement used shall be of the special character defined, with a thickness of not less than 2ins. in front of all important metal members in columns and beams.

These requirements are the minimum that can be adopted with reasonable prospect of avoiding collapse in case of a serious fire amongst combustible goods stored in large buildings.

The Necessity of Precautions regarding Reinforced Concrete.

Hitherto architects and engineers who devote themselves to reinforced construction appear to be so confident of the strength and stability of this new structural material under all conditions that they fail to give reasonable attention to the fire-resisting qualities of the materials used, being quite content to declare that steel rods embedded in concrete must be more fire-resisting than any other combination of materials.

Published examples of the action of reinforced concrete under actual fire fail to give definite particulars with regard to the diameter of the reinforcing rods, the composition of the concrete used and its thickness in front of metal members. Information as to the nature of the fire and its extent, when extinguishing appliances are brought to bear, with the power of these appliances and water-supply available, are also usually of the vaguest description or altogether absent.

Any photographs submitted by interested parties illustrating the effect of the fire will doubtless be taken from points of view most favourable to the object the photographer desires to serve. Sometimes such photographs do not even illustrate the portions of the building affected by fire, but only parts damaged from some other cause, such as explosion or shock, having no bearing whatever on questions of fire-resistance.

Experts in reinforced concrete buildings agree that to obtain the best results (considered only from a structural point of view and under normal conditions) reinforcing rods must be placed near the outer surface of the concrete, a thickness of 1in. in front of the rods being generally adopted; but this thickness is altogether insufficient for the protection of metal rods against a serious fire, and the aggregates, sand and cement in the concrete used to protect the metal rods, are of the greatest importance.

It has been conclusively proved that concrete having gravel aggregates is especially unreliable under the action of fire, and the same may be said of other dense material. Aggregates that have passed through fire and are of a porous nature, such as broken stock brick, clinkers, clean coke-breeze, with finely ground high-class Portland cement and sand, offer the greatest resistance to fire, but even with these materials a thickness of at least 2ins. in front of all important metal members is essential for reasonable security.

There would be no difficulty in applying a thickness of 2ins. of concrete of this description for the protection of all metalwork, while the central portion of the concrete might be of different material.

It is to be feared that some of the large buildings already erected with reinforced concrete will fail when subjected to a serious fire amongst their inflammable contents, especially in cases where the building chiefly consists of extensive galleries round large central vertical spaces passing through all floors; such buildings certainly involve the possibility of very serious consequences, as proved in numerous instances, and even reinforced concrete construction can do but little to lessen this evil. The Horne Building, Pittsburg, is a case in point.

The method adopted for protecting columns and other parts of reinforced concrete structures against mechanical injury during the trucking and deposit of merchandise is of the greatest importance. With this object in many large public warehouses, steel angles of considerable size and weight are partly embedded in the concrete flush with its outer face at each angle of numerous square columns supporting very heavy loads, these steel angles being held in place by riveted lugs passing into the concrete. In the event of a serious fire amongst merchandise stored round these columns the steel angles would twist, displacing portions of the concrete, leaving important reinforcing rods exposed at most critical moments. Any mechanical protection needed should be held in position independently of the concrete and be placed against its outer face only.

Divisional walls relied upon as fire stops in warehouses and similar buildings should not be less than 9ins. thick.

In a fire test made in a reinforced concrete box having the lower side omitted, set on brick walls, the whole enclosing about 175 cubic feet, moisture was freely driven through the sides of the box, two of which were 6ins. and two 4ins. thick. The evaporation of this moisture kept the outer surface of the concrete cool, but on the passage of moisture ceasing, which it did at the end of the test of 45 minutes' duration, the outer surface of the concrete became very hot. Combustible goods against a reinforced concrete wall less than 9ins. thick would be liable to ignition by heat from a fire burning on the opposite side of the wall.

Some Examples.

With the kind permission of the Executive of the British Fire Prevention Committee, I am glad to be able to give a few photographic lantern views showing results following test of different classes of concrete and metal construction, in which all conditions are definitely recorded.

As you are all aware, the Fire Prevention Committee's tests are conducted under the Universal Standards of 1903, which require for classification, as affording "full protection" against fire, a fire test of four

A SCOTCH FLOUR MILL FIRE.

hours' duration (attaining 1,800 degs. Fahr.), followed by the application of water for five minutes from a steam fire-engine to a floor measuring at least 200ft. super. loaded with at least $2\frac{1}{2}$ cwts. per ft. super.; whilst other classifications are obtainable, such as that of affording "partial protection" and "temporary protection" for lesser periods and under less stringent conditions.

According to these standards it will be observed how few of the examples I am presenting have obtained the highest classification, and it will also be observed that some of the examples presented are entire failures.

A SCOTCH FIRE.

The two views on this and the preceding page of a fire which occurred recently at an old flour mill in Glasgow show how unsatisfactory the form of construction adopted is in many buildings of this class in Scotland, for this is typical of many similar factories. We have taken this opportunity of drawing attention to the need of re-building such structures. It will be seen from the view of the interior of the second floor on this page that the floors and roof are of ordinary exposed woodwork. This floor was a forest of shafting, hoppers, elevators, &c.

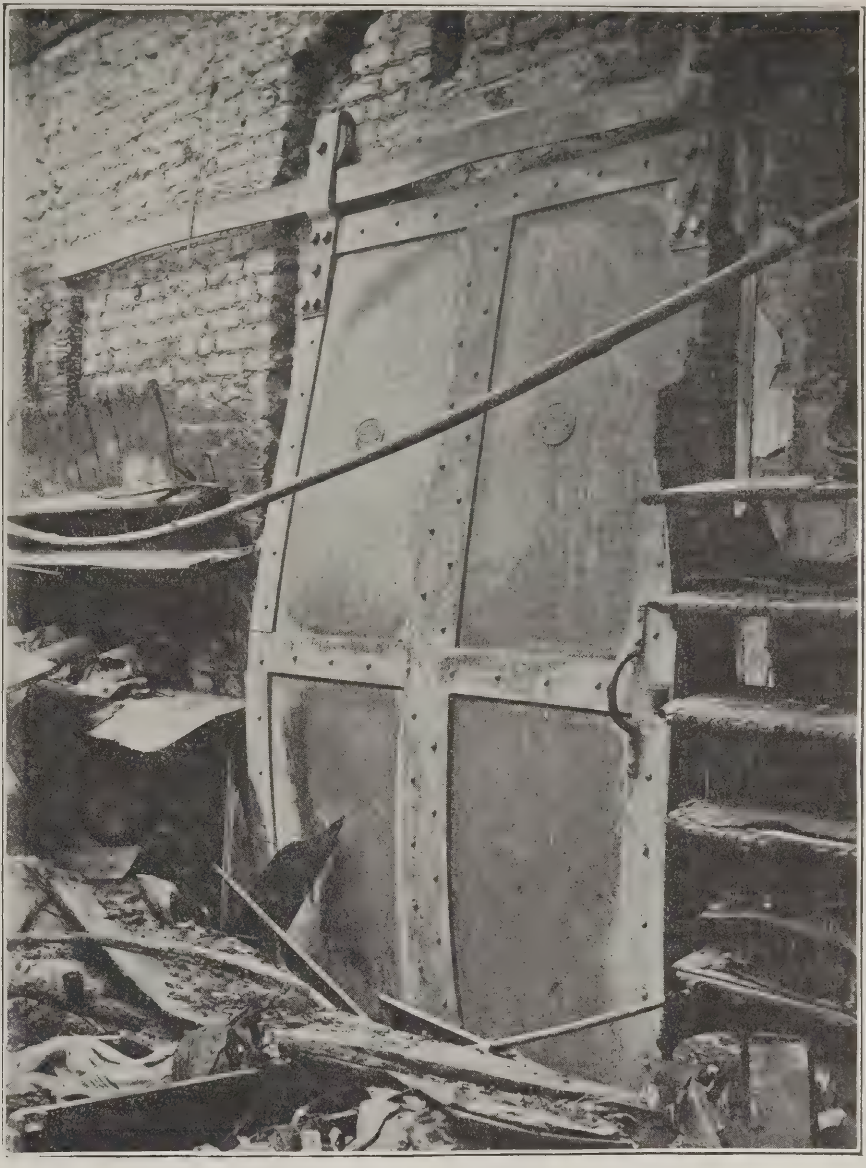
PROJECTING SHOPS.

The Walworth Road Fire and its Lessons.

The fire on July 18th, which commenced in the projecting drapers' shops, Nos. 342 and 344, Walworth Road, proves that the desired safety will not be secured by the provisions of the London Building Act, 1905, requiring that "the projecting portions (if exceeding 7ft.) of all new and existing shops shall be provided by the owner with a roof constructed with fire-resisting material not less than 5ins. thick." The regulation does not go far enough.

This fire originated in the shop window of No. 344 under the eyes of an assistant engaged in fitting incandescent electric lamps into their sockets with a 200 volt current on. The fire rapidly spread over No. 344 and No. 342, which are open to each other, amongst light goods hanging from lines, as is usual in other similar establishments.

Both shops extended under main buildings, having three storeys above. The whole was at once filled with smoke, and flame effectually cutting off the staircases, which were the only practicable way of escape from the upper storeys which were used for bedrooms.



THE BUCKLED DOOR AT WALWORTH ROAD FIRE.

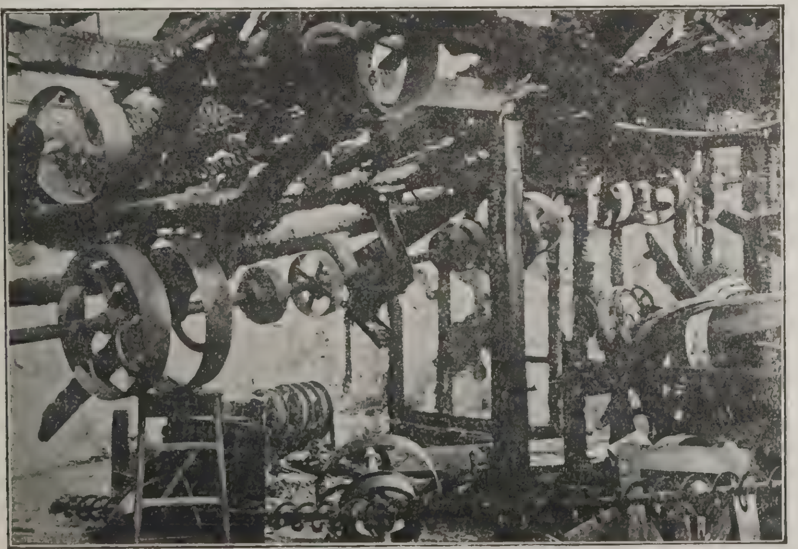
To obtain real security in such cases it is necessary that the fire-resisting material be continued over the portions of shops under the stories of main buildings, with a smoke and fire-resisting enclosure to stairs and a door from such enclosure direct to the open air.

It is to be hoped that the opportunity of the impending amendment of the London Building Act may be taken to somewhat strengthen the clause named in the first paragraph of this note. It is curious that this very necessary precaution should have been overlooked by all concerned in the framing of the amendment as passed.

At a time when various districts and associations of shopkeepers are petitioning the London County Council that the protection of the roof is too great a hardship, this fire should be an object lesson.

The original proposal of the London County Council for the London Building Acts Amendment Act, 1905, contained provisions to meet dangers in the main portions of buildings communicating with projecting shops which the rapid spread of smoke and fire in this case has shown to be very real, but such provisions were abandoned in consequence of powerful opposition from property owners.

Sec. 74 of the London Building Act, 1894, requires every building exceeding 10 squares in area, used in part for purposes of trade or manufacture and in part as a dwelling, to have floors and walls of fire-resisting material separating the trade from the dwelling portions with passages and staircases and other means of approach to the dwelling portion constructed throughout of fire-resisting materials. It is quite as important to apply this to existing as well as to new buildings.



A SCOTCH FLOUR MILL FIRE.

FIRE TESTS.

The British Fire Prevention Committee arranged by request of their continental and colonial members to conduct some of the current tests on Wednesday, July 18th, and Wednesday, July 25th, so that architect members of the committee visiting the seventh International Congress of Architects, and engineer members visiting the meetings of the Iron and Steel Institute, might have an opportunity of attending.

The testing operations of Wednesday, July 18th, were in respect to the wire glazing of window openings, and were of a most interesting character, as both different types of wired glass were under investigation, as also different casements. Both casements and wire glass are of American origin, the tests having been undertaken at the request of the Mississippi Wire Glass Co., of the United States.

On Wednesday, July 25th, the tests undertaken were with a reinforced concrete floor, Johnson's indented bars being the reinforcement, and slag concrete being employed.

Contemporaneous with these two structural tests, there were several tests on Wednesday, July 18th, with a fire extinguisher of the powder type, which is at the present moment the subject of investigation by the committee, the extinguisher being known as the "Kylfyre" extinguisher.

As was only to be expected, the tests brought together a very interesting attendance of members and friends, including such distinguished architects as Mons. Bonnier, architect at the Elysée, Paris; Herr J. Stübben, the former well-known city architect of Cologne; Mr. Alcide Chaussé, city architect of Montreal; in fact, representatives from the different parts of the world. There was also a very strong attendance on the part of the public authorities, most of the Government departments being represented, as also a number of municipal bodies.

Full reports will, of course, be issued in the ordinary manner by the committee, but in the meantime the operations might be summarised as follows:—

Mississippi Wire Glass Test.

The first test with three window openings having casements of hollow tin, iron and teak respectively, partly glazed with transparent and partly glazed with opaque wired glass, the whole being under test for classification as affording "Temporary Protection" (Class A)—*i.e.*, for the 45 minutes' test at temperatures ranging to 1,500° Fahr. This test was followed by one in which three openings were again glazed, two being fitted in hollow tin casements and metal casements respectively, whilst the third opening had glass applied direct to the framework.

This was a most remarkable test, inasmuch as, for the first time, wired glass was subject to test beyond the 45 minutes required for "Temporary Classification," the test being continued for no less than $1\frac{1}{2}$ hours at temperatures exceeding 1,500°, in fact, touching about 1,650° Fahr., the idea being to see whether wired glass could be put forward for classification as affording "Partial Protection."

At the conclusion of each test, water was applied from a steam fire engine for a period of 2 minutes.

GENERAL VIEW OF ONE OF THE PROJECTING SHOPS IN WALWORTH ROAD.

The "Kylfyre" Extinguisher Tests.

These tests took the form of a series, partially open-air tests, partially indoor tests, conducted in pairs with a view of obtaining average results, the extinguisher being always applied in the one case by an employee of the special manufacturer, and in the other case by an employee of the committee, the latter being changed about. These tests will probably serve for a basis for the arrangement of extinguisher tests generally.

Reinforced Concrete Floor Test.

This test was a four-hour test for the purposes of obtaining classification as affording "Full Protection" (Class B.), four hours of fire to a temperature up to 1,800° or over, followed by the application of water from a steam fire engine, and the floor being loaded $2\frac{1}{2}$ cwts. per ft. super. The test was conducted in a committee's large testing chamber, which has an internal dimension of 15ft. by 22ft. The reinforced concrete beams were thus of 15ft. span, and as there were three bays to the floor, each bay may be taken as having measured about 7ft. by 15ft. As indicated above, slag concrete was used, the cement being of the "Ferrocrete" brand of the Associated Portland Cement Manufacturers, Ltd.; the slag came from Nottingham. The floor was put up to the design of the Patent Indented Steel Bar Co., and indented bars were used throughout for the reinforcement of both beams and bays.

THE LONDON COUNTY COUNCIL'S FIRE REQUIREMENTS.

With some Notes on Fire-resisting Construction.*

By Percival M. Fraser.

The London County Council have from time to time received powers to draw up and enforce requirements for the protection of buildings and their inmates from fire.

The following classes of buildings are chiefly concerned by these requirements:—

1. Public buildings such as churches, concerts and assembly rooms, etc.
2. Factories and workshops.
3. Theatres and music-halls.
4. Common lodging-houses.
5. Commercial premises having a floor more than 50ft. above the pavement.
6. Buildings in which sleeping accommodation is provided for more than twenty persons.
7. Buildings having projecting shop fronts.
8. Buildings storing petroleum or other highly inflammable goods.
9. Buildings more than 30ft. high, except dwelling-houses occupied by not more than two families.

The following gives a detailed list of the requirements governing each class of buildings:—

---

* A paper read at the meeting of the Institute of Sanitary Engineers, held at Manchester July 6th.

(1) Public Buildings.

The following provisions apply:—

1. The staircase must be brick enclosed. The staircases and corridors must not be less than 3ft. 6ins. wide for a building accommodating under 200 persons; for every additional 100 persons the staircase must be increased 6ins., until a maximum width of 8ft. 6ins. be reached.

Every staircase over 6ft. wide must have a central handrail. In lieu of a single staircase two may be substituted, each two-thirds the width, neither being less than 3ft. 6ins. wide.

Every gallery must have a separate staircase, with direct exit to the open air.

Doors must open outwards, with no fastenings outside.

This last requirement should be amplified so as to exclude any fastenings whatever save those which open automatically by pressure from the inside.

(2) Factories and Workshops.

An existing factory in which more than 40 people work must be provided with such means of escape as the Council consider reasonable under the circumstances of each case.

All new factories must be provided with proper means of escape.

Fire-resisting staircases should be of 2-in. teak or oak in flights of not more than 12 steps without winders. Treads to be not less than 10ins., and risers not more than 7½ins. Handrails should be provided on both sides, and carried round the landings.

The staircases should be on dead bearings, and enclosed with a partition of incombustible materials at least 3ins. thick, carried up through the thickness of the floors and ceiled with similar materials. All constructional ironwork should be incased. The staircases vary in width according to the number of people accommodated, but generally are 2ft. 6ins. for 100 persons, with 6ins. additional width for every further hundred.

Incombustible staircases must be brick enclosed with a newel wall; the walls to be 9ins. thick, and carried up and ceiled; no well-holes are allowed. The steps are to be solid square or spandril steps, supported at both ends on the brickwork. Handrails to be chased as far as possible flush with the walls.

Internal staircases are best placed against an external wall, and must be properly lighted and ventilated.

External iron staircases must be supported on dead bearings. The steps and landings to be of non-slippery material, and risers must be provided.

Handrails are to be supported on close balustrades about 3ft. 6ins. high.

Lifts must be enclosed for a height of 4ft. above each floor level with 9-in. brick walls or with incombustible materials, and hardwood self-closing doors must be provided in the openings. Lifts must not be connected with any staircase.

The doors must be of oak or teak, and must be solid without panels, and at least 1¾in. full of thickness. Doors of deal are allowed in lieu of hardwood, provided they are sheathed with iron and asbestos sheeting.

All doors must be hung in two folds to open in the direction of exit, and if fastenings are required only panic bolts or ball catches are allowed. Doors next staircases must be free of fastenings: and provided with metal springs to close them, They must be hung in lobbies so as to open clear of the steps and landings. The lobbies must be of similar materials to the enclosure, and must be ceiled, and the portion of the floor within the lobby must be pugged with 5ins. of concrete.

Doorways must not be less than 4ft. 6ins. wide.

Those portions of the floors forming parts of an enclosure must be pugged.

The topmost floors of high factories must be of fire-resisting construction.

Windows next the street should be casement windows, with cockspur fastenings only, and of a sufficient size to form an additional means of escape in case of Fire Brigade relief. These, however, are not considered to form an alternative, and are merely auxiliary means of escape. The glazing where forming part of an enclosure should be of either of the two forms sanctioned by the Council—viz., wire-wove glass or plate glass in electro glazing in 4-in. squares.

Iron ladders are allowed to facilitate roof escape. They are rarely used internally, but in some cases are allowed in conjunction with trap-doors, but they are not allowed in one flight between two floors. They must have flat treads and handrails both sides.

Balconies are allowed, and are useful to afford access between adjoining buildings when it is not desirable to cut doorways in the party wall.

Bridges are allowed for the same purpose, and they must not be enclosed.

Roof escape is effected by means of trap-doors and step-ladders from the top floor, or by continuing the main staircase up to the roof. This latter plan is inadvisable, as it creates a strong up draught when in use, and the smoke and flame are thus drawn into the staircase.

All parapets must be provided with guard rails, and gangways must be formed with boards, etc., where necessary.

Climbing irons may be used in certain positions. Double doors should be provided in the main party walls to divide buildings of a large size.

Gangways 3ft. 6ins. wide must be maintained between the means of escape.

(3) Theatres.

An important special requirement in this connection is that one-half of the boundaries of the site shall abut on public thoroughfares.

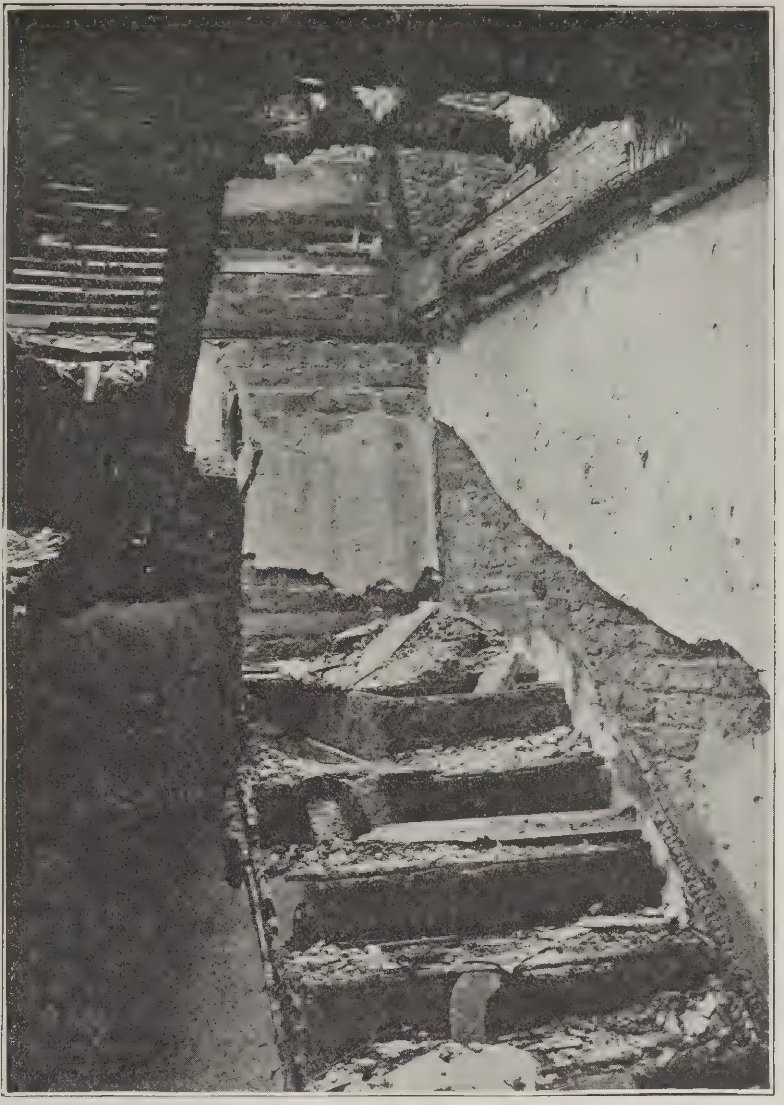
All staff and dressing-rooms must be of fire-resisting construction, separated by brick walls with iron doors from the auditorium, and no hanging decorations are allowed.

Two separate exits into different thoroughfares must be provided from each gallery.

The vestibules must be one-third greater than the united widths of all corridors connected thereto.

All doorways in the proscenium wall must be provided with self-closing iron doors. All decorations around the proscenium must be of fire-resisting materials.

The opening must be provided with a fire-resisting drop-curtain with an arrangement for a water spray on the inside.



THE STAIRCASE AT THE WALWORTH ROAD FIRE.

Every public staircase and corridor must be of fire-resisting materials and not less than 4ft. 6ins. wide for 400 people, and for every further 100 must be increased as described under public buildings. They must have solid steps of incombustible materials with 11-in. treads and 6-in. risers; flights to have not more than twelve and not less than three steps in each without winders.

The staircase shall be completely enclosed by 9-in. brick walls.

The staircases must be roofed with fire-resisting materials, and must have a continuous handrail on both sides chased into the walls where possible.

Gangways 3ft. wide must be maintained at all points, and must be kept free from temporary seats, &c.

All constructional ironwork must be properly protected.

All limelight tanks and boilers, etc., must be placed in a fire-proof chamber.

All thoroughfares which would be called into use in the event of a panic must be provided with a double system of lighting, such as gas and electricity, with oil or candle lamps, such lights being maintained whilst the public are on the premises.

No mineral oils or compo gas piping is permitted.

The stage, auditorium and staircases must be lighted by separate services and meters, both of gas and electricity.

Gas burners must have wire guards and chimneys, and the taps must not be available to the public.

All doorways used by the public must be at least 4ft. 6ins. wide; doors to be hung in two-folds to open outwards so as not to obstruct persons escaping. They must not open immediately upon a flight of steps.

Where fastenings are required they must be of such a nature that they will open automatically by pressure; no others are allowed.

Doors which are used in entrances may be hung to open both ways, but when opened inwards must be fastened back.

The above applies to all barriers and gates.

No open fires allowed except in staff-rooms, and to be protected by screens,

Radiators must not be placed so as to project into gangways.

The H.P. hot water system is not allowed, but hot air and the low-pressure hot-water circulation systems must be used, providing they have an open cold water supply cistern, and the pipes throughout are of galvanized wrought-iron with the exception of those in immediate contact with the boiler, which must be of copper.

The boiler must be of copper, wrought-iron or mild steel, with a safety valve attached to boiler, and not to circuit pipes, so as to keep it free from soot.

Hydrants must be provided, each having a 30-ft. length of hose.

With the intermittent system of water supply, storage tanks containing 250 gallons for every 100 persons in the audience shall be provided.

Theatres must be in telephonic communication with the nearest fire station.

Exits must be indicated by large and legible notices, placed about 7ft. above the floor; all doors not leading to exits shall be accordingly marked.

Wet blankets and fire pails must be kept in the flies and scene docks, with legible placards immediately above.

Hatchets, hooks and other appliances for tearing down scenery, etc., must be placed in convenient places, and a responsible person must be employed to see that such appliances are ready for use.

Fire regulations must be conspicuously posted up and the whole staff should be made acquainted therewith.

In conclusion of this class there are stringent regulations affecting the proper insulation of the electric wiring for the prevention of short circuits and ignition from other causes.

(4) Common Lodging-houses.

The requirements for this class of building are substantially the same as for factories and workshops, and are enforced by virtue of special Acts which provide that lodging-houses must be provided with means of escape, to the satisfaction of the Council before a licence is granted.

(5) Commercial Premises.

New commercial premises having a storey more than 50ft. above the pavement must be provided with an upward escape to the roof, with access from thence to the roofs of the adjoining buildings, by means of ladders, bridges, balconies, &c.

Guard rails must be provided where necessary.

(6) High Buildings and Buildings Accommodating more than 20 People.

All new and existing buildings having a floor higher than 50ft. above the pavement, and buildings in which more than 20 people sleep or work, must be provided with reasonable means of escape, and must not be occupied before being certified to this effect.

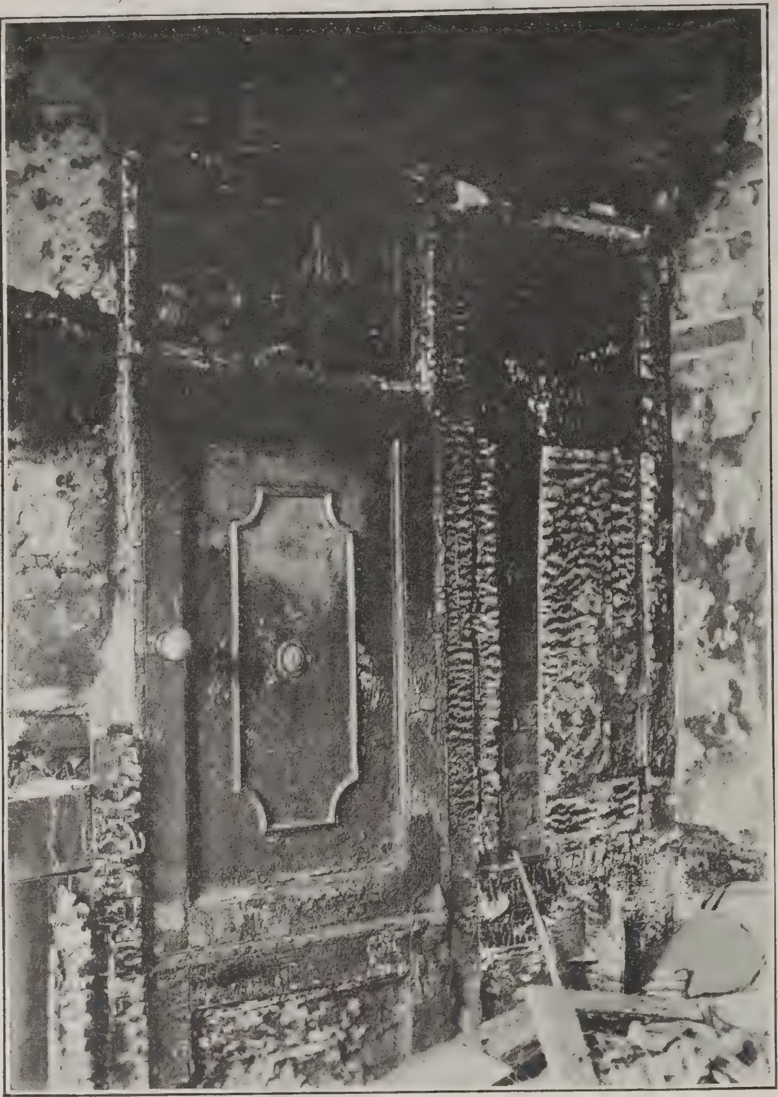
(7) Projecting Shop Fronts.

Any building having a shop front on the ground floor projecting 7ft. or more beyond the main front must have the roof constructed of fire-resisting material at least 5ins. thick. Concrete pugging is allowed.

Any roof lights must be constructed of fire-resisting materials for a height of 2ft. above the roof.

(8) Buildings Storing Inflammable Goods.

Buildings used for the storage of petrol, petroleum, turps, methylated spirits or any other inflammable liquids must not have any parts used as a living room or work-



THE SAFE AT THE WALWORTH ROAD FIRE.

room unless adequate safeguards are taken against the spread of fire, and unless ready means of escape are provided from the living rooms.

(9) Buildings more than 30ft. High.

New buildings of this class must be provided with roof escape. Buildings containing not more than two families are exempted from this portion of the Act.

The foregoing list gives but the merest outline of the actual requirements, and is intended only to show their scope. There is a number of saving clauses, and certain of the above-mentioned buildings are exempted.

In the case of existing buildings the general method of procedure when serving requirements is as follows:—Plans are prepared by the Council by the aid of which a list of requirements is formulated. It is usual for the official making the requirements to inspect the premises, but they are mainly drafted on the plans. This, I think, is the chief reason that a great many of the requirements are not practical.

The list as forwarded leaves all details and methods of construction to the building owner, so that it may be argued that the Council have no need to be strictly practical in their requirements.

It is usual for the building owner to submit proposals showing an alternative arrangement.

An important point to notice is that the Acts state that the Council are empowered to make only such requirements as are reasonable, which implies that each case is to be taken on its merits.

My experience of the London County Council is that they do not consider each case on a distinct basis, but attempt to apply stereotyped requirements without sufficient regard to the effect it will have on the business carried on in the building. Thus the provision of a new staircase is repeatedly insisted upon regardless of the fact that it may open up communication between workpeople of different sexes; again, in the case of patent and secret manufactures, facilities are afforded to undesirable persons to gain access.

External iron staircases are a continual source of thefts and other annoyances. Exit doors near the street must be set back in lobbies in order that the doors may clear the pavement. These recesses are put to improper uses in poor neighbourhoods such as factories and common lodging-houses generally occupy. The facilities for roof escape and the increased number of exits in the latter class of buildings necessitate the employment of a large staff for supervision, and cause serious trouble to the police, as they form a ready means of escape for the large number of criminals who use these premises.

The cost incurred in complying with the Council's requirements for a common lodging-house for 200 or more lodgers will generally run into three figures, and for these and also for factories the amount is often out of all proportion to the value of the premises.

There are many appeals therefore against what the building owners consider unreasonable requirements, but the Council's requirements have generally been upheld by the legal decisions.

The main principles employed by the Council in formulating requirements appears to be as follows:—

1. Separate and distinct means of escape from every room, with direct access to the open air, should be provided. This can be effected in several ways, such as by two staircases or by a staircase, and access to the roof, or access to adjoining buildings by means of doorways, balconies, bridges, etc. The alternative means of escape should be as far apart as possible.
2. The buildings should be divided up, both vertically and horizontally, into as many fire risks as possible by means of walls, partitions and floors, with self-closing doors, etc.
3. Well-holes acting as flues must be enclosed.
4. All means of escape must be protected with materials sufficiently fire-resisting to withstand fire for 30 minutes.
5. Means of escape must be of ample dimensions, and otherwise constructed to avoid accidents in time of panic, even though from a false alarm.
6. Endeavour should be made to keep back smoke as well as flame.
7. The most direct routes should be taken to the open air.
8. All "dead ends" should be avoided.

The following schedule of fire-resisting materials is set forth in the London Building Act:—

Good stock bricks.
Granite or stone.
Iron, steel or copper.
Slates and tiles.
Terra-cotta.
Flagstones under certain conditions.
Concrete formed of cement or lime and broken bricks, tiles, stone, ballast, pumice-stone, coke-breeze.
Reinforced concrete.
For doors and similar fittings, oak, teak, jarrah, or other hard woods, $1\frac{3}{4}$in. full, in solid bedded frames. The same for stairs, internal and external, with plaster soffits.
Beams and posts of hard woods with 1in. of plaster, on metal lathing, or when in combination with iron 2ins. of plaster.
For floors, concrete and iron 5ins. thick.
For ceilings of projecting shops, 5ins of concrete pugging.
Enclosures and partitions of 3-in. incombustible material.
Glazing in wire-wove glass $\frac{1}{4}$in. in thickness, or electro-glass in squares of 20ins.

It should be noticed that the provision of stone steps and iron doors is often required by Council. Both of these are quickly destroyed by the action of fire and water, and should, I think, be eliminated.

Notes on Fire-Resisting Construction.

The common expression "fire-proof" is hardly a correct term, as no building materials are proof against fire, and are still less so when built into a structure by reason of the joints and the different expansions of various materials under heat, when used in combination.

A material which will stand a great heat may immediately be destroyed when drenched suddenly with water, such as will certainly happen in any ordinary conflagration. A material cannot therefore be considered of value as a fire resistant until it has passed through fire and water.

The following précis of the effects of the great Cripplegate fire in London in 1897 is instructive:—

Ordinary stock bricks almost uninjured.
Perforated bricks broken to pieces.
Stone destroyed.
Iron girders twisted and curled up.
Wooden beams charred, but otherwise practically uninjured.
Match-boarding burnt to tinder.

Allowance for expansion must be considered. Concrete and iron expand in the same ratio, but terra-cotta and iron do not.

It is well to remember that although the first cost of fire-resisting construction is large, the insurance rates and rent roll are both favourably affected thereby. Architects should not take upon themselves the responsibility of specifying a material which has not been tested.

Elaborate tests have been carried out by the British Fire Prevention Committee with all the ordinary forms of construction and most of the well-known patents. They divide the tests into three classes: Temporary, partial, and full protection.

(To be concluded.)

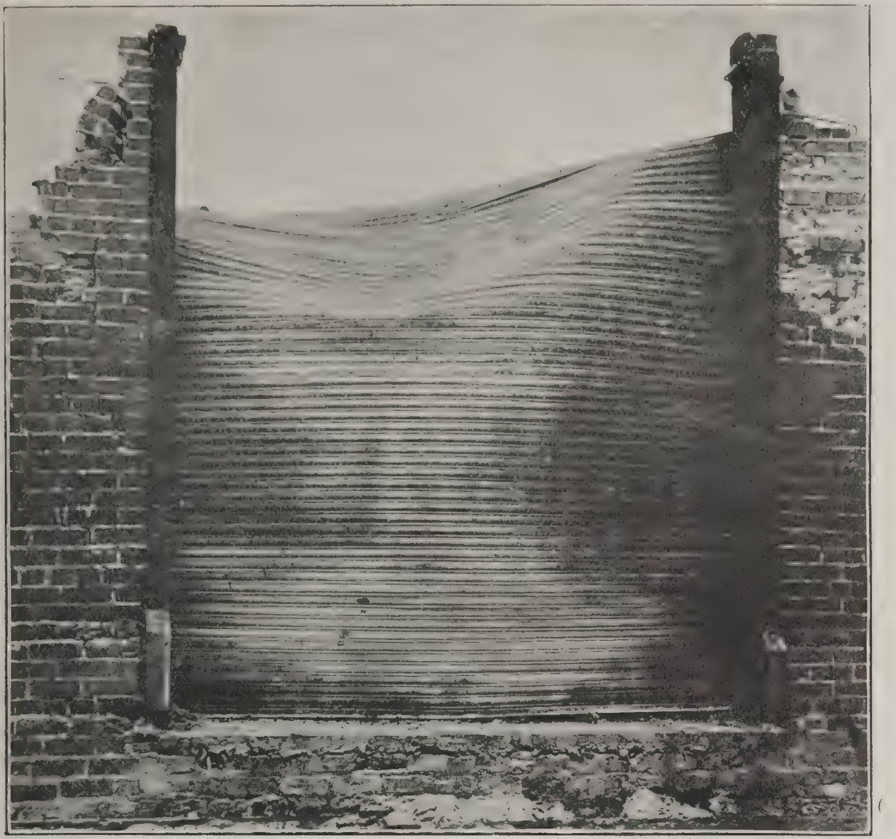


FIG. 1.—KINNEAR ROLLER DOOR AT STUYVESANT DOCKS FIRE.

THE PROTECTION OF VERTICAL OPENINGS BY STEEL ROLLER SHUTTERS.

In view of the attention which has lately been directed to the subject of the protection of openings by shutters or doors, and the tests recently made which have shown the general superiority of shutters and doors of the roller type, we have secured several photographs showing the results of actual fires upon the latter kind, and give below a general discussion of the subject, together with particulars relating to the illustrations.

In comparing the relative merits of the various methods available for closing or protecting doorways or other vertical openings, we have to consider the efficiency of any particular method as a means of closing the opening, more particularly with regard to its fire-resisting qualities, the ease and convenience with which it may be opened or closed, the question of obstruction when the door or shutter is open, and of encroachment upon any space that can be advantageously used for other purposes.

In all these respects, a steel rolling shutter of suitable construction has points of decided superiority to any other available method. It can be formed of thin sheet steel in narrow slats, the section of the slat being such as to secure the highest degree of strength and rigidity with the least possible weight, while the edges of the slats can be so interlocked as to form an extremely flexible hinge throughout the length of the slat. This interlocking hinge is also a feature which leaves the slats free to expand individually when exposed to intense heat, without buckling the shutter as a whole. Similar provision for expansion can be made in the face of the guides or grooves in which the shutter runs, by the use of slotted bolt holes. The malleable iron endlocks attached to the individual slat to prevent lateral movement, and to provide efficient wearing surface, have the further advantage of filling more closely the groove, and so preventing the passage of heat or flame in a case of fire.

The barrel round which the shutter is about to be coiled being furnished with counter-balance springs to take the weight of the shutter, the labour involved in raising or lowering, and consequently, the time occupied, can be reduced to a minimum, and the barrel containing the springs being protected by asbestos insulation, this property of easy operation is not liable to be destroyed by fire just when it may be most valuable. Nor is there any reasonable possibility of the grooves in which the shutter runs being so obstructed, by dirt or otherwise, as to present any obstacle to the immediate use of the shutter at any moment. In the case of grooves or tracks let into the floor, much difficulty might be experienced at the critical moment from this cause, and for the same reason any automatic provision for the closing of the shutter, in case of fire, controlled by a fusible link, is more reliable in the case of a roller shutter than in the sliding type of door.

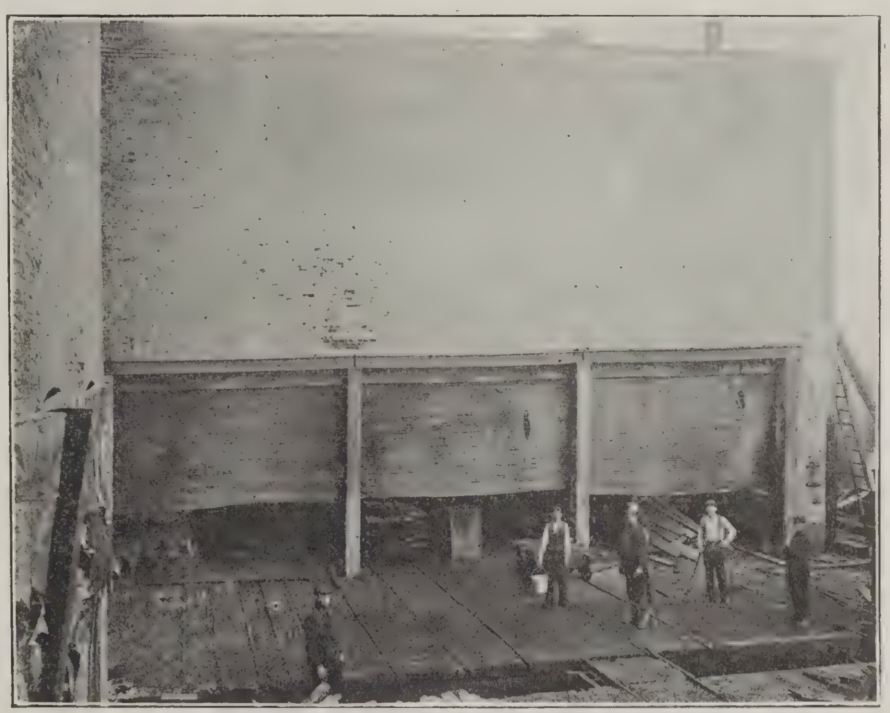

FIG. 4.—ROLLER DOORS AT A TIMBER YARD FIRE.

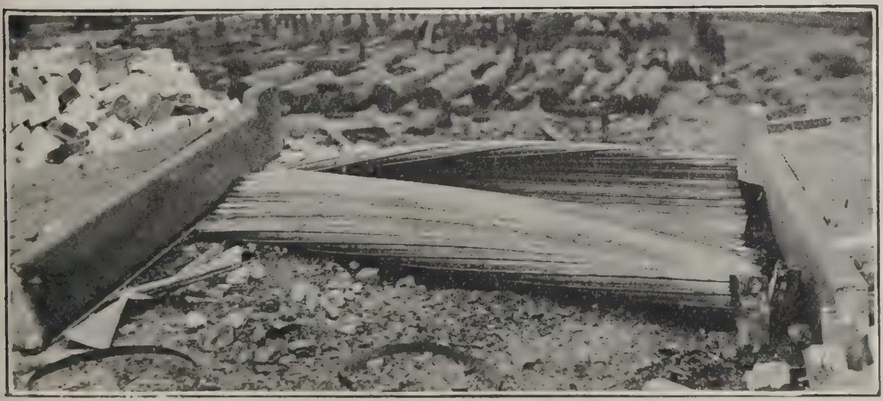

FIG. 2.—ANOTHER DOOR AT STUYVESANT DOCKS FIRE.

With respect to the question of obstruction, the guides or grooves only occupy a few inches of space at the edges of the openings, and even this slight projection can be easily avoided by placing the guides in chases or grooves formed in the thickness of the wall, while the shutter coil and brackets are quite out of the way at the top of the opening, occupying only a small space, and that in a position where it is least likely to be otherwise useful.

It need scarcely be pointed out that a rolling shutter, formed of separate slats, not interlocking, but joined only by ordinary hinges some distance apart, could not present a barrier for more than a few moments to a fierce fire, nor could it after a short exposure form anything but a more or less expanded trellis work.

It will be seen from figs. 1 and 2 how interlocking roller-shutter doors have stood up to the very last, and even with the terrible conflagration heat which can be seen to have spalled the bricks, these doors remained in position till the upper part of the holding gear fell with the upper portion of the wall.

Figs. 1 and 2 are photographs taken of a fire at New Orleans some time ago, when the Stuyvesant Docks were totally destroyed there. The fire consumed not only the buildings, but a number of railway trucks which stood on the tracks. The shutters had been put up five or six years previously, and were in good condition at the time of the fire. Most of them were applied to openings in the outside walls.

Fig. 3 shows a Kinnear roller-shutter at the entrance to a lift in a building which was destroyed by fire. From this it will be seen that the shutter was not damaged and could be readily raised after the fire. When the photograph was taken, men were at work inside the lift shaft repairing the small damage caused to the lift guides. The building had wooden floors, and as the wood floor burned away the shutter continued to drop until it found a seating on the iron floor joist, thus effectually stopping the fire penetrating to the lift shaft.

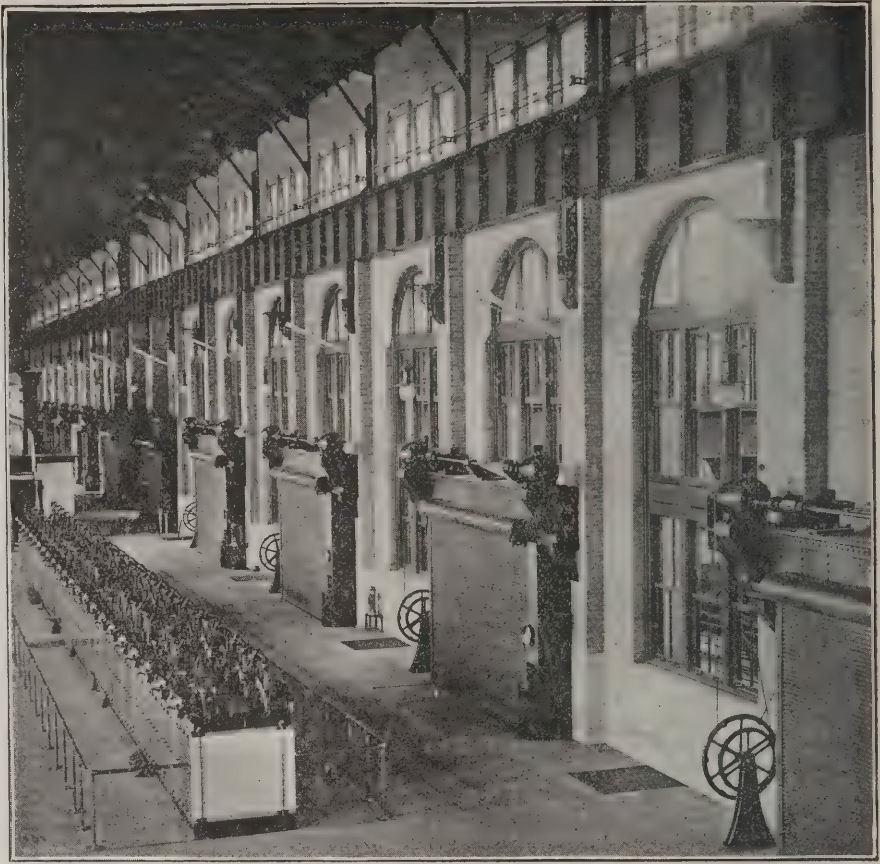

FIG. 5,—VIEW OF POWER HOUSE, NIAGARA FALLS ELECTRICITY GENERATING STATION.

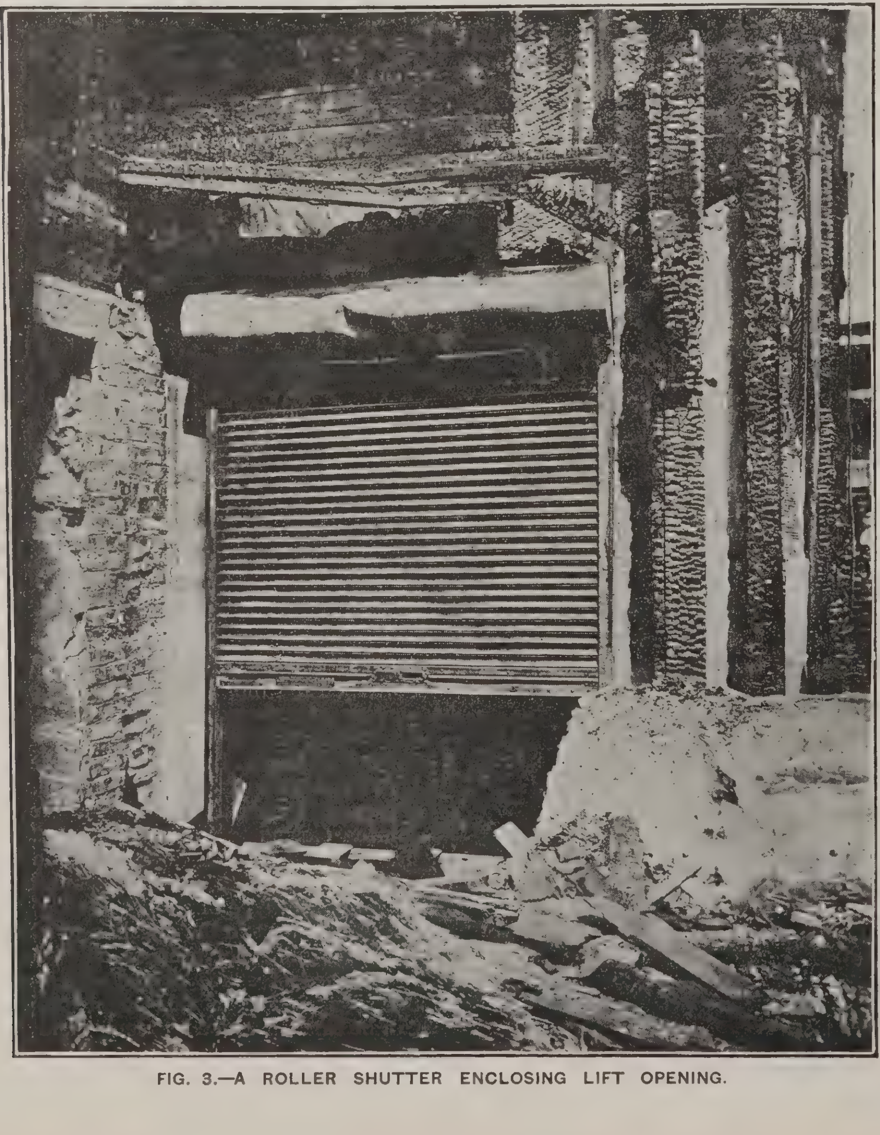

FIG. 3.—A ROLLER SHUTTER ENCLOSING LIFT OPENING.

Fig. 4 shows three Kinnear doors after a very severe fire in a timber merchant's yard. Two million feet of timber was stored in the space adjoining these doors, and this timber burned and the fire raged for four hours or more. The destruction of the wooden shutters covered with tin plates—*i.e.*, armoured doors—shown on the left of the view in the adjoining building, demonstrates the intensity of the heat. The roller-doors stopped the fire from entering the building to which they were fitted, and barring the cracking of the walls, as shown in the view, the interior of this building practically suffered no damage.

Fig. 5 is a view which, it is true, does not show the effect of fire upon shutters, but is interesting as illustrating a large building where a great number of these Kinnear rolling doors have been used. The view is of one of the power houses at Niagara Falls. It will be noticed that all these shutters are operated by electric motors, and that they are also arranged so that it is possible to operate them by hand in case of need.

Regarding the fire resistance of these roller shutter doors as demonstrated in Great Britain, nothing could be clearer in their favour than the series of tests undertaken by the British Fire Prevention Committee with the Kinnear type, first with a large single roller shutter door, described in this journal in a previous issue, and then with a single door for a long period—namely, 2½ hours—and with a double door for party wall purposes for a long period of 4 hours. These are also reported on in an earlier issue. Besides this, last May tests were undertaken with small roller shutters to window openings.

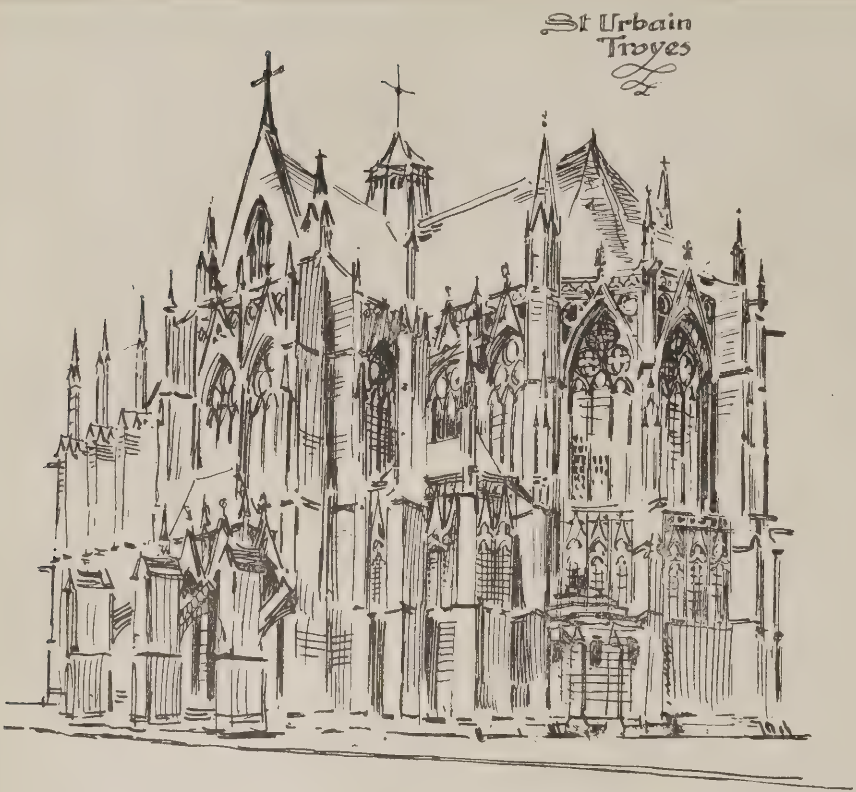
A Preliminary to Registration. IN the Irish Labourers Act, which has just passed the House of Lords, a clause has been introduced relating to the employment of architects in connection with work under this Act, which provides that every person so engaged shall satisfy the Local Government Board that he is qualified to discharge such duties. Mr. Redmond, M.P., observed in the House that he did not like this clause, and some of the Irish Nationalist papers comment unfavourably upon it also. Mr. R. M. Butler, a well-known Irish architect, has ventured to support the introduction of such a clause in the Act. While we agree in principle with his remarks, we think that at the present moment such action is open to question. He says: "With the proposition that a man should be competent to perform the duties he undertakes, and is paid for performing, no one can quarrel. So far as architects and engineers are concerned, all they complain of is that persons without the smallest semblance of qualification enter into competition with and obtain commissions as against men who have devoted time and money to acquiring a knowledge of their calling, and who have served a legitimate apprenticeship. Surely it is to the interest of the District Councils, the labourers, and the ratepayers that the best available service be secured. As to the suggestion that the addition of this clause is calculated to add to the cost of the schemes, I am convinced that the contrary will be the case. Economies in planning will be effected, and the tendency will be to promote better designed but not necessarily more costly houses." Of course, the only question the architectural profession is likely to raise at such a reasonable procedure is that the decision as to who is qualified to act as an architect should rest with the Local Government Board. This official department has quite enough duties to perform without attempting to judge as to architects' qualifications. We have yet to learn that this or any similar public body is qualified to act as an examining body for architects. If the architectural profession was fully recognised by Parliament and a Registration Act granted we should entirely support Mr. Butler, but it will be some years at least before this comes to pass. If, however, Parliament admits the principle that it is desirable that architects should have proved their qualifications for undertaking the design of buildings, as it appears it has, the first battle in the campaign has been won. The introduction of this clause into this Irish local government measure is of considerable importance to the profession and forms a precedent which registrationists should not be slow to avail themselves of. We must say, however, that for the moment, although we are glad to see Parliament admits the desirability of an architect being qualified, we must think the clause referred to creates an anomalous position in so far as a Government department is called upon to express an opinion upon an architect's qualifications to build dwellings for the working classes.

Metalwork in Buildings. THOSE who have visited Paris and the chief cities of the United States, or, indeed, those who have studied illustrations of French and American architecture, must all have had their attention caught by the extensive use of decorative metalwork made by the architects of these two countries. Considering the great charm this metalwork gives, it is indeed surprising that we do not find English architects following their lead. The reluctance which is displayed in England in the use of decorative metalwork is somewhat difficult to understand. We can ascribe our indifference to various reasons, but they seem almost too weak to serve as any excuse. We presume that the first reason advanced, if the profession were put on its defence, would be that of cost, but our public buildings, important office premises and other large buildings are not cut down to the narrowest limits of cost, and we must, therefore, come to the conclusion that if metal work is not used it is because money has been spent upon the provision of other decorative materials. There is an apparent desire on the part of many persons to bespatter the whole surface of buildings with ornament, and also to surface their walls and floors with expensive materials such as marble and mosaic. This betrays ignorance of the laws of architectural effect. Decoration may be rich, but it should not be overloaded. It is better to concentrate interest upon a few details that are good than employ much commonplace ornament, and it is an appreciation of this that is the *raison d'être* of the extensive use of metal work in France and the United States. Whatever the decoration employed by architects abroad it is, as a rule, not extensive, but it is choice, and the larger surfaces are on the whole plain, although skilfully proportioned and modelled. Rich and expensive materials are not used for whole surfaces, and, therefore, interest is attracted to the metal grills, staircase rails and balustrades, gates and marquises among other things. A solution to the question of cost, too, is obtained in other ways. Although in the United States a great deal of the decorative metal work in offices and public buildings, such as lift enclosures, is in bronze and brass, in France, on the other hand, we find much use made of wrought-iron, a material that not only is capable of being given great variety of form with an economy of labour, but is cheap in first cost. In France, too, extensive use is made of stock designs, although these are in such good taste that the casual observer never notices it. In consequence of this metal work is brought within the reach of architects of buildings where economy has to be carefully studied, such, for instance, as in working-class dwellings or apartment houses, these in Paris having a noticeable use of the material in the staircase handrails, entrance gates, window sills and balconies. We have heard it also said that metal-workers are few and far between in England, but there are a great many firms and craftsmen able and willing to do good work, and if the demand were created the supply would quickly be found. The architectural profession does not, however, as a rule trouble to study the necessities of metalwork design, and leaves the detail to trade firms; consequently, there is often a lack of taste, or if, as in some cases, the firms employ designers of ability they often display a lack of architectonic sense.



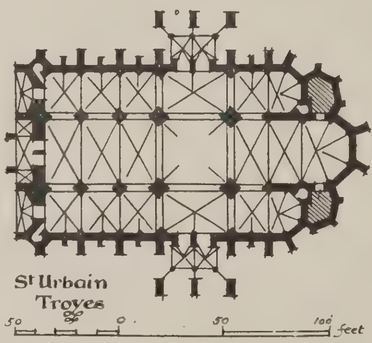
St Urbain Troyes

SOME NOTES ON TROYES AND ITS CHURCHES.—I.

By C. A. N.

THOUGH Troyes is now a busy and prosperous city, and though its citizens have lately changed the name of their old "Rue Notre Dame" to that of "Rue Emile Zola," the place has preserved an old-world aspect such as one rarely meets with in English towns of any importance, where historic landmarks have so often been destroyed in order to gratify the vanity of a municipality, or to testify to the skill of a latter-day architect. Its streets are still lined with ancient overhanging timber houses, often plastered over and modernised in front, but generally unaltered in the narrow side alleys which intersect the city. There are several large brick and stone houses of the sixteenth and seventeenth centuries; a pretty town hall with two-storeyed classic front, and courtyard with wooden galleries on one side like an old London inn; and the museum and hospital are both dignified stone buildings in the best style of the eighteenth century. The city, too, contains a series of fine churches, possessing decided local peculiarities, which series begins with the twelfth-century Madeleine and ends with several late Gothic and Renaissance buildings of great interest and considerable beauty.

The Madeleine is the oldest church in Troyes; its plan is unusual, the nave and transepts being of equal length and the nave having double aisles, so that the general outlines are approximately square. Nave and transepts each consists of a double bay with sexpartite vaulting, the aisles and crossing having plain groining. The choir has been extended in the sixteenth century, when a Flamboyant tower, which now carries a Renaissance belfry, was added at the south-west corner of the church.



St Urbain Troyes

The earlier parts of the building possess in a limited degree the refinement and delicacy of such contemporary works as the west front and the old belfry at Chartres. The design of the nave and transepts is of cathedral-like character, with low massive piers and arches, a large arcaded triforium, and a clearstory with an internal passage, very pleasingly vaulted in the gable windows. The first bay of the choir is early Gothic work, but the apse, the chapels, and the choir vault are late Flamboyant of the local type. In this part of the church the triforia are omitted and the resulting contrast between the airy and open sanctuary and the somewhat heavy nave and transepts is very striking. The well-known rood-loft in this church with its three hanging arches and the remains of altars on each side belongs to the same period as the apse. Its detail is of the utmost delicacy, particularly admirable being the treatment of the open work fleur-de-lis panels in the parapet, whose broad clean-cut surfaces, cunningly twisted, give value to the intricate vine work in the cornices and the arch crockets.

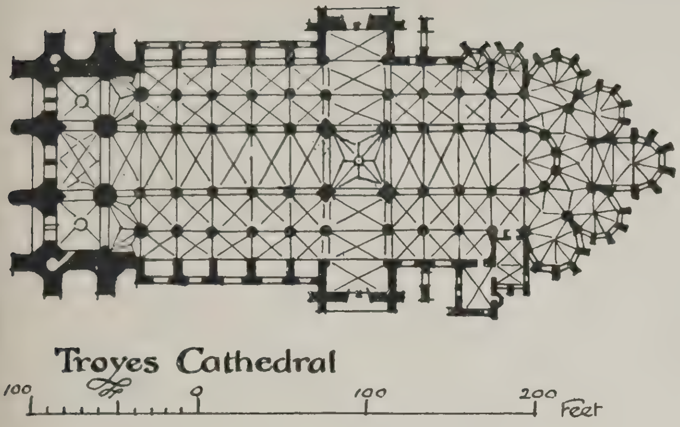
Hôtel de Ville Troyes

In spite of some "restoration" of its earlier parts, the interior of the Madeleine is essentially pictorial. There is good late glass of rich colour in the apse and chapel windows, parts of which have been very well restored. The tall round pillars of the chevet are panelled with seventeenth-century woodwork and the high altar, though of pseudo-classic design, is well proportioned and unobtrusive. Undoubtedly the church owes much of its charm to the preservation of its rood-loft, but it is strange how completely its builder, Jean Gualde, had in 1508 abandoned the ancient tradition of enclosing the choir. Here, as at St. Etienne du Mont at Paris, the loft spans the church without in any way obstructing the view of the altar, whereas in our old English examples, and in most of the few remaining French ones, such as those at Arques and Albi, the screen appears to have been considered as essential a piece of furniture as the loft which it carried.

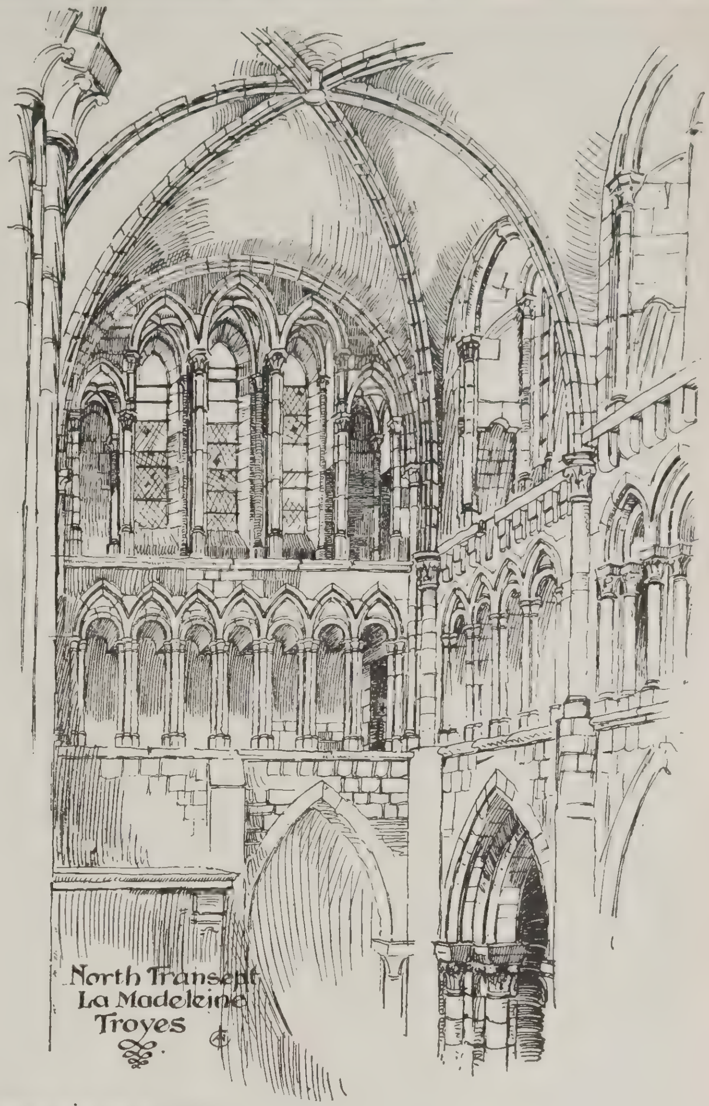
Externally the Madeleine is a picturesque medley of crumbling thirteenth-century and Flamboyant work. The treatment of the aisle roofs is worth notice, the inner bays having lean-tos against the nave and transepts, while the angle bays have low pyramidal roofs. To the south of the fine tower, in the Rue de la Madeleine, is the stone wall of the old cemetery, with a rich Flamboyant gateway (1525), and there is another simpler cemetery gate in the Rue Thiers to the east of the church.

Hôtel de Vauluisant Troyes

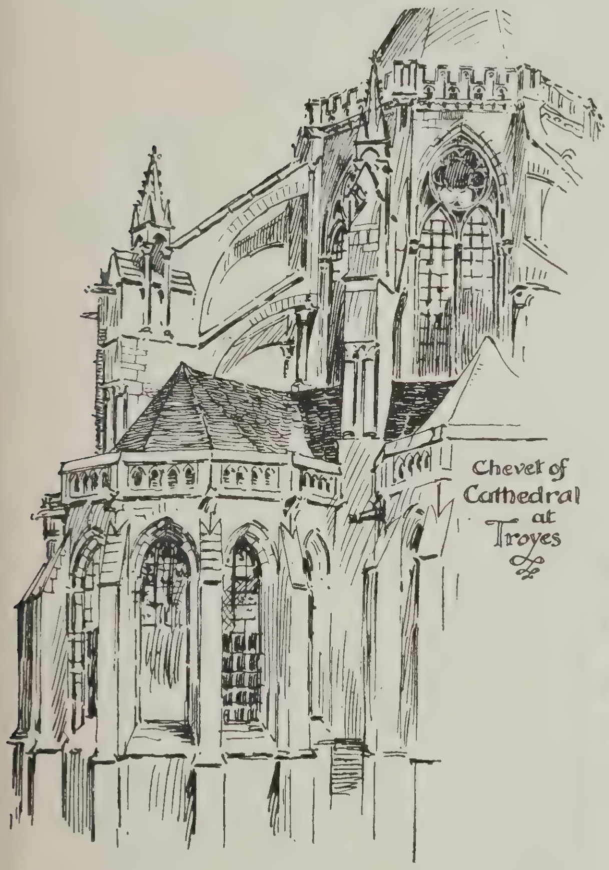
Rue Champeaux Troyes



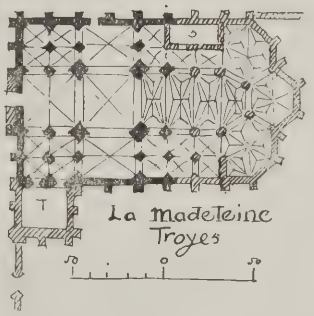
Troyes Cathedral



North Transept La Madeleine Troyes



Chevet of Cathedral at Troyes



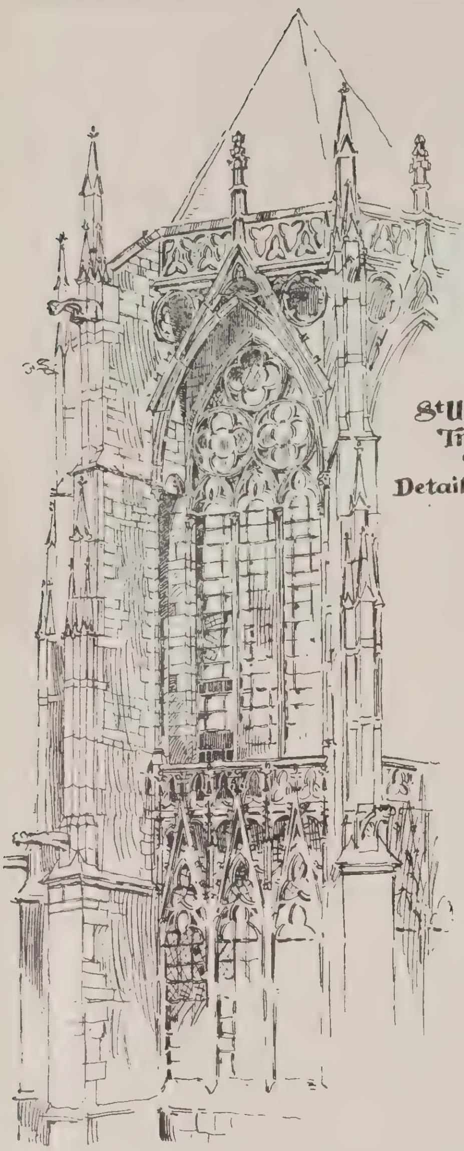
La Madeleine Troyes

The cathedral choir and transepts are thirteenth-century work, the five-aisled nave is of the fourteenth, the chapels and west front of the fifteenth and sixteenth centuries, and the tower Renaissance. But, though the scale is good and much of the original glass has been preserved, the cathedral has neither the dignity of Reims nor Chartres, nor the romantic and mysterious beauty of such a church as the Madeleine. From a constructive point of view, however, it is of considerable interest. Viollet le Duc [cathédrale] describes its choir as an example of medieval jerry building. Its foundations were scamped, its masonry is of poor quality and small scantlings; everything has been sacrificed in order to produce an imposing effect as cheaply as possible. Under such conditions it was impracticable to adopt frankly the usual constructive system of large French Gothic churches with slight piers and a ring of massive buttresses to keep the vaults in their place. Here the clerestory and vaulting are of the lightest possible construction, and the buttresses are smaller than usual, while the piers and arches are comparatively massive, as if with the idea of throwing a considerable portion of the weight to be carried upon their foundations, and so minimising the work which the buttresses had to do. The experiment has not proved entirely successful, for the transepts are "buckled" in an unsightly and apparently dangerous manner, while the clearstory and vault of the choir had to be entirely rebuilt between 1850 and 1866.* It must, however, be remembered that the work had stood for six hundred years without substantial alteration, and this in spite of the fall of the central tower, which was destroyed by fire in 1700, and so it must be admitted that, considering the means at his disposal, the builder of the cathedral choir, who it is conjectured was a pupil of Thomas de Cormont, the thirteenth-century master-mason employed at St. Denis, must have been an artist of considerable ability and resource. Throughout the cathedral the triforia are glazed, and much of the glass is contemporary with the stonework. The thirteenth-century glass in the choir has all been restored and cleaned, and it is possibly on this account that it looks like an imitation of itself. The predominant colours are ruby and blue, the whole effect is a warm purple, and the glass is lacking both in richness and in sparkle. The fourteenth and fifteenth-century glass with which the triforia and clerestory of the nave are filled, is perhaps somewhat coarse and wanting in refinement, but the effect of so large an expanse of rich, full colour is extremely striking. The character of this glazing differs altogether from that of the fiery thirteenth-century glass at Chartres and Reims, as it does also from the silvery tones of the best English glass, such as that at York. Its colour is so strong and so much varied that the glass overpowers the architecture, and does not take its proper place in the general scheme of the interior. In the nave chapels is a good deal of fine late glass with clear backgrounds and rich Renaissance borders to the lights; the western rose has fine Renaissance glazing in a low key of colour; but perhaps the most effective glass in the cathedral is that in the gable of the north transept, which is almost entirely white, with some small but telling patches of colour.

The nave has double aisles of equal height, and is well and solidly built, but its architecture is not of an inspired order, and externally the chapels between the

---

* The newest Transatlantic theory is that these settlements are interesting examples of architectural refinements, "the medieval entasis" in fact.



St Urbain
Troyes
Detail of Apse

buttresses spoil the effect. But the west front, the work of Martin Cambiche, of Beauvais, is of the best type of late Flamboyant. Most of its sculpture has been destroyed, but the detail is very rich and delicate. The Renaissance north tower has double round-headed belfry windows with big louvres. The south tower has been taken down to the level of the nave vault. The west gable of the nave stands one bay eastwards of the west front, the old west window having been replaced by an arch when the front was added in the sixteenth century.

Close to the cathedral is the church of St. Urbain, built at the cost of a native of Troyes, Jaques Pantaléon, who reigned as Pope Urban IV from 1261 to 1264. It has been much restored and its exterior is thin and spiky; this is particularly felt on the north and west sides, which have been much renewed. The south side is grey and weatherbeaten, but the scale of everything is too small to produce a really impressive result.

Structurally, the church is the most interesting in the city, and it has been very fully described by Viollet le Duc. This writer points out that the only stone quarried at Troyes is a kind of clunch, suitable only for vault fillings and wall backings. For his general masonry the builder had to use a coarse stone known as "pierre de Bourgogne" from quarries a few miles away. A third material, "pierre de Tonnerre," was imported from a considerable distance. This is a hard compact stone, obtainable in large slabs of no great thickness, and capable of being used off its natural bed. For the sake of economy this last material is used in the thinnest possible scantlings; the buttress fronts are faced with slabs of it a few inches thick and capped with slender pinnacles of the same stone. The arches of the flying buttresses, the pierced parapets, the gutters, gargoyles, and traceries are likewise formed of thin slabs, the traceries being let into grooves in the coarser masonry. Tonnerre stone is also used for the long and unusually slender mullions and for the window sills and other exposed parts of the work. It is probable that there is no masonry construction in the world which exceeds this church in lightness; for instance, the slabs out of which the window traceries are cut do not exceed eight inches in thickness. The designer's aim was to use the costly Tonnerre stone with the utmost economy, but at the same time to build a church whose vaults should be poised upon an almost unbroken clerestory.

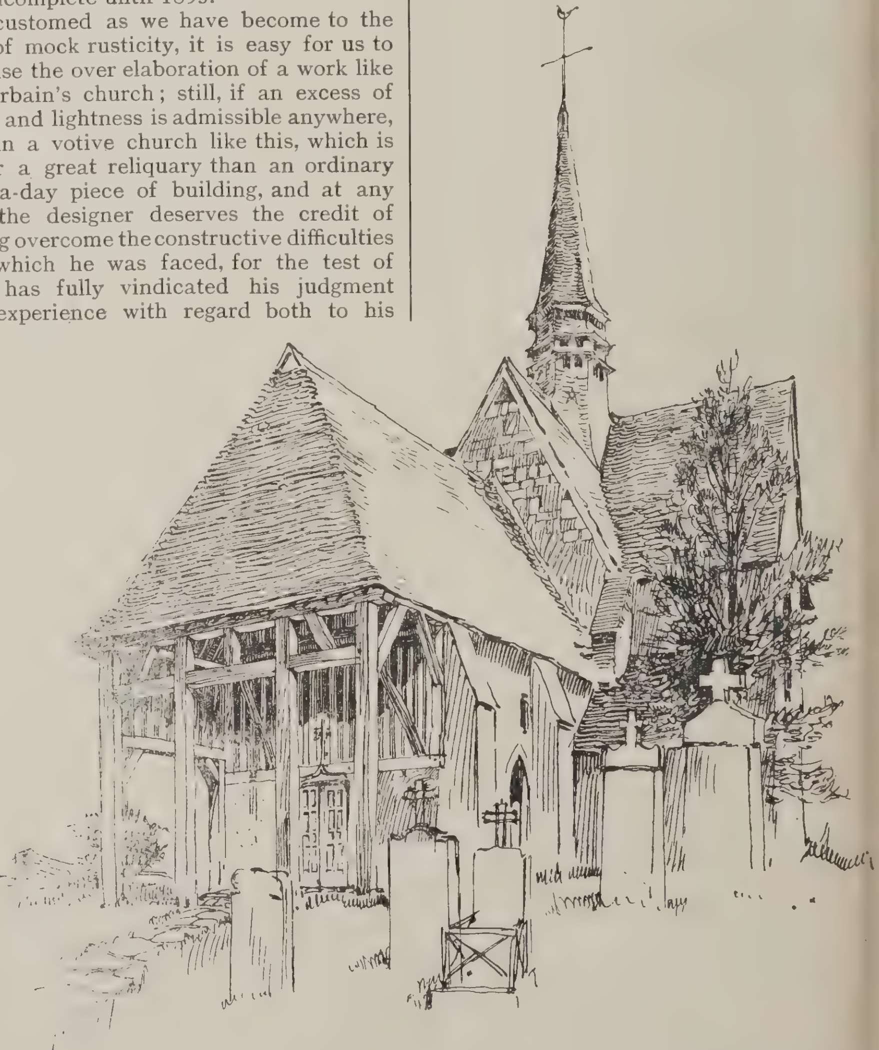
On entering the church it is surprising to find that the piers and arches are of more than ordinary solidity, but probably their massiveness contributes greatly to the dignity of the interior. It is said that the church was meant to carry a steeple at the crossing, but at present there is only an insignificant turret. The upper part of the nave is modern, the church having been left incomplete until 1895.

Accustomed as we have become to the cult of mock rusticity, it is easy for us to criticise the over elaboration of a work like St. Urbain's church; still, if an excess of finish and lightness is admissible anywhere, it is in a votive church like this, which is rather a great reliquary than an ordinary work-a-day piece of building, and at any rate the designer deserves the credit of having overcome the constructive difficulties with which he was faced, for the test of time has fully vindicated his judgment and experience with regard both to his choice of materials and his solution of the engineering problem.

The chapel of St. Gilles, a small fourteenth-century half-timbered building in the outskirts of the city, originally consisted of a simple nave with a flèche on its ridge and an apsidal sanctuary. The walls were of post and pane work with windows formed in the solid framing, the roof barrel ceiled. It is of insignificant size and its original appearance has been much altered by the addition of large transepts and a western annexe, but it is of interest as one of the few remaining timber churches in France.

Here, at Troyes, there was difficulty in obtaining good building stone, and, though the local tiles were of some repute, the use of brickwork does not seem to have become popular until the seventeenth century, and then only for domestic work. Oak timber was, however, plentiful in the district, and it is still the staple material for farm buildings in the neighbourhood; even in the city itself most of the houses are built of wood.

The nave of the cathedral was being completed during the period of depression caused by the English wars, and it is likely that this work, which was carried out in a costly and substantial style, was a heavy drain upon the resources of the faithful in the whole diocese. Moreover, during the fourteenth century the citizens of Troyes had in hand the building of the nave of St. Jean and the church of St. Remy. Both



Barbery St-Sulpice
near Troyes

of these churches would take high rank in any English town; at St. Jean's there remain the fourteenth-century nave, crossing, and south-west tower, covering an area of about 150ft. by 60ft., vaulted throughout and built with clerestory and flying buttresses in almost cathedral fashion, and St. Remy's, though on rather a smaller scale, is built upon similar lines. It is hardly to be wondered at that a chapel like that of St. Gilles, in an outlying suburb of the city, should have been built in a homely fashion and of the cheapest materials then obtainable.

Not far from the city the church in the little village of Barbéry St. Sulpice has a curious projecting wooden portico sheltering a half-timbered west front. It is a quaint little church with sixteenth-century vaulted transepts and apse, a pretty flèche, and a low barrel-ceiled nave, it contains a carved Renaissance west gallery and some good late glass. It is a little singular that most of the village churches round Troyes are vaulted, but, then, most of their vaults appear to have been set up in the prosperous years of the sixteenth century. The church building of this period is perhaps more remarkable and interesting from an architectural standpoint than anything else in Troyes.

(*To be concluded.*)

Our Plates

Inholmes, Hungerford, is being erected by Messrs. Maides & Harper, of Croydon, in brick with a tiled roof, and the electric light installation is being carried out by Mr. V. G. Middleton, of Broadway Chambers, Westminster, S.W. The house is situated about five miles from Hungerford. Mr. Leonard Stokes, F.R.I.B.A., is the architect.

Correspondence.

The Ownership of Plans.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Frequent reference is being made to this matter in your journal and to a case decided in the English courts about 36 years ago, *Ebdy v. McGowan*, but no reference seems to be made to the well-known case decided in the House of Lords about 10 years later, the case of *Her Majesty's Commissioners of Works v. The Trustees of the late Sir Charles Barry*. In that case the whole of the plans, specifications, &c., which had been prepared for the erection of the Houses of Parliament, and upon which the usual commission had been paid, were demanded from the architect's trustees as their property, but only to be used by the Government for reference in case of alterations or reconstruction in case of fire. The case was fought out in the lower courts and finally appealed to the House of Lords, with the result that the whole of the plans, &c. (perhaps a waggon load) were ordered to be delivered up to the pursuers as their property, and for the purpose asked, but no restriction as to use was made in the order of the Court. This would become a new case and a new fight.

Following upon this decision the directors of the Bank of Scotland raised an action in the Scotch courts against the trustees of the late Mr. David Bryce, F.R.I.B.A., R.S.A., for possession of all the plans used in the erection of their head office at Edinburgh. After going some length in court the plans were given up and the case taken out of court, but no decision was given.

J. L., Clerk of Works.

DUMBARTON.

Finchley Cottage Hospital.

To the Editor of THE BUILDERS' JOURNAL.

Sir,—Mr. Saxon Snell's definition of the different terms "separation" and "isolation" as applied to wards is perfectly correct, but in the case of this competition there is no room for any doubt or discussion on the matter. Competitors were definitely required to provide an isolation ward or wards for the reception of cases of infectious fevers, and it was further required that the room or rooms for this purpose must be "aerially severed but not necessarily (although preferably) detached from the main building." Nothing could be clearer than this, and whatever the private opinion of a competitor might be he is bound to comply with the conditions or to run the risk of being disqualified.

In further reference to the question of the necessity for an isolation ward in a cottage hospital, it should be remembered that there are always two kinds of cases which could be removed under any circumstances to an isolation hospital—one is erysipelas (which needs isolation quite as much as scarlatina), the other is measles, a disease received by no public isolation hospital.—Yours faithfully,

LONDON, W.C. YOUNG & HALL.

A Reinforced Concrete System.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In its issue of June 30th *The Builder* published a leading article entitled "The Adhesion of Concrete to Steel," in which the author, after giving his opinion on the value of the adhesion of plain bars, attacked certain statements made by the Indented Steel Bar Company in their catalogue and pamphlets. A letter was immediately sent to the Editor of that paper asking for the courtesy of space for a rejoinder. No reply was sent to this letter, and a second one shared a similar fate.

On July 18th, a letter was sent to the Editor of *The Builder* explaining the technical grounds on which the statements referred to were based, and a request was made for its insertion. This letter was returned with a curt statement from the Editor of *The Builder* declining "to insert a criticism on an opinion from a firm commercially interested in the subject."

I thereupon wrote to the Editor of *The Builder* asking him, in the interests of that fair play for which the British Press is noted, to allow us to reply, but, up to the present, no answer has been received to this letter.

May I ask if you will allow us space in your widely read publication for the insertion of this letter, which is substantially the same as that which was addressed to the Editor of *The Builder* on July 18th, and which was refused publication by him.

Had the leading article referred to confined itself to a general consideration of the subject of the adhesion of concrete to steel without mentioning the name of any commercial company, it is quite possible than an attempt on the part of our company to rush into print might be construed as an ingenious method of advertisement. In view, however, of the fact that statements made by us were attacked, it seems only fair that we should have an opportunity of defending those statements.

The writer of the article in *The Builder* commences with the statement that "there is comparatively little adhesion between concrete and a plane surface of smooth perfectly clean steel simply pressed upon its surface," and it is difficult to see how this adhesion becomes (as the writer proceeds to argue), in the case of a plain embedded bar, much greater than the shearing strength of the concrete, and indeed sufficient to pull the concrete near the rod through the surrounding mass. These statements are so inconsistent that they can only be explained by the fact that the author of the article has taken a rather peculiar view of what happens when an embedded bar is pulled out of the concrete, and support our contention that it is the unevenness and roughness of the bar that is mainly responsible for the bond. If this idea is carried a little further the value of a mechanical bond is at once apparent.

In looking up authorities to substantiate his position, the author of the article would appear not to have consulted the three latest books on the subject of reinforced concrete.

We quote from W. Noble Twelvetrees' excellent treatise :—

"The statement is sometimes made that the bond of concrete and steel is not destroyed by thermal or other stresses. There is, however, satisfactory evidence that adhesion may be overcome by interior stresses following unequal expansion of the two materials when under the influence of heat. The adhesion originally existing between the constituent parts of concrete and steel is also affected by working stresses as well as vibration and shocks such as are experienced in most structures."

He further states, in regard to the Indented Bar, that "It is of considerable merit, giving mechanical adhesion with a proportionally small quantity of metal."

In regard to adhesion he states :—

"In ordinary practice it is probably quite safe to take the value of adhesion between 250 and 500 pounds per square inch, according to circumstances."

In Buel and Hill's book the statement is made that the safe working adhesion is 60 to 100 pounds per square inch; while Taylor & Thomson say: "When the yield point of the metal is not exceeded, the minimum ultimate adhesion for first class concrete may be placed at about 275 pounds per square inch."

The example of the ½-in. rod taken by the writer of the article in *The Builder* was a fortunate selection in that the ratio of the area of the cross section to the perimeter is ¼; why was not a usual size, such as is used in large beams, say 1-in. or 1¼-in., chosen ?

Very often, even with such beams as might be reinforced with half-inch bars, it is necessary to develop the indicated stresses in a much less distance than the six feet quoted; and this is especially true when concentrated loads must be provided for. It would be interesting to have the author's opinion in the case of a beam carrying a concentrated load in the centre, in which case the stress in the bars may be assumed to increase uniformly from zero at the support to the full stress under the load (this assumption is not exactly correct owing to the position of the neutral axis not being constant throughout the length of the beam) as to whether he would consider the safe adhesion in the distance to be 500lb. times the surface of the bar, or is the 500 to be considered the maximum adhesion at the centre, in which case the total adhesion would be ½ by 500 by the surface of the bar ?

Treating briefly of Considère's results, it is certainly to be regretted that the author discussed so fully the case of embedded bars and then stated that the results are not applicable to beams. It is not often that the designing engineer has 10 feet, as suggested by the writer of the article, in which to develop the stress even in a ½-in. bar, much less a 1½-in. rod.

Referring to the specific instances quoted, we wish to treat of them separately.

Objection was made to, and doubt cast upon, the statement that plain bars were on the decrease. The objector's experience would appear to be limited by the conditions existing in his immediate neighbourhood. One cannot expect plain bars to be supplanted in countries where people are not alive to the advantages of deformed bars, much less in countries where deformed bars have not as yet been introduced. The phenomenal sales of the Indented Bars in the States is alone a sufficient answer to his criticism. The trend in Germany is also shown by the recently issued regulations requiring that the bond shall be, so far as is possible, of a mechanical nature.

The author has also overlooked the fact that the use of deformed bars has an important bearing on the cost of the building as a whole. When builders specify mixtures of 1 part cement to 2 parts sand to 3 parts gravel or even 1 : 2 : 2 mixtures in order to gain adhesion (without a corresponding increase in compressive values) when a 1 : 2 : 5 mixture should answer all requirements, if a deformed bar were used, an enormous increase in the cost of the structure, over its proper cost, results.

In regard to the action of water as affecting the adhesion between concrete and steel, the author of the article makes no mention of Breuille's experiments, reference to which was made in the text criticised, and a perusal of which would have substantiated our statements.

In regard to high unit stresses also, the article gives misleading ideas as to our practice. Our catalogue recommends generally a factor of four in the elastic limit of the steel, corresponding to a stress of about 14,000lbs. in the steel.

It is rather remarkable that our practice should be criticised when it seems to be the custom of the companies doing business here to use stresses of 16,000lbs. per sq. inch, giving only a factor of less than two on the strength of the beam.

We trust we have not trespassed too much on your space, and beg to thank you for your courtesy in allowing us the opportunity to vindicate our position.—Yours, &c.

PATENT INDENTED STEEL BAR
CO., LTD.
CECIL H. WHITTINGTON, *Director.*

The Builder of Pontypridd Bridge.—At Groeswen Chapel, near Caerphilly, a bronze tablet, designed by Mr. Goscombe John, A.R.A., has been erected to the memory of William Edwards, the builder of the famous bridge at Pontypridd and other bridges in South Wales. Edwards was a native of the parish of Eglwysilan, the son of a farmer, brought up to work on the farm. Yet he became first a builder of walls, outhouses, and cottages, and ultimately the designer and constructor of a most remarkable bridge. The fame of the Pontypridd bridge is due to its great span, the beauty of its arch, and his ingenious device for taking the weights off the centre.

Notes and News

Mr. John Adams, a builder of Lochgelly, died last week.

A Builder and Gasfittings.—At North London Police Court, John William Clark, a builder, of Church Road, Homerton, was sent to gaol for two months' hard labour, for stealing gasfittings belonging to the Gas Light and Coke Company.

The question of widening Kingston Bridge, which, since the running of electric tramcars over it, has been described as "most dangerous," was recently considered by the Joint Committee in the County Councils of Middlesex and Surrey. The committee has informed the Bridge Trustees that these councils cannot consider the subject until the trustees are ready to transfer the property relating to the bridge to the councils.

Strand to Holborn Scheme.—The London County Council last week agreed to fix its seal to the agreement, when ready, for a lease to the syndicate which has been formed for dealing with the central portion of the crescent site in connection with the Holborn to Strand improvement. If a company with a satisfactory capital is not formed in six months the agreement will be ended and the deposit of £55,000 forfeited to the Council.

An accident in Bradford occurred recently when the floor of a large room at Water Lane Dyeworks collapsed and fell into the dam below. Fortunately, no workmen were in the room at the time, those who would ordinarily have been there having a day's holiday. Some forty machines used for dyeing purposes were let down into the dam. The accident was in all probability caused by the rotting of the supports of the flooring by the water.

A Building Trade Exhibition in Newcastle.—The Newcastle Exhibitions, Limited, are organising an exhibition in the Exhibition Hall, specially for builders, decorators, and sanitary engineers. A committee has been formed of leading architects, surveyors, and contractors, who are giving the venture all the assistance possible. The idea of the exhibition is to show as far as possible everything connected with the building trade. The exhibition opens on Saturday, September 15th, and Mr. W. A. Cowle is the manager.

A Medieval Plumber in Scotland.—Some amusing details are given by Mr. Lawrence Weaver, in the August number of the *Burlington Magazine*, of the way in which plumbers worked five hundred years ago. One, William of Tweeddale, was employed to rebuild the quire of Arbroath Abbey. The most notable clause in this medieval contract provides that William shall, after the walls are parapetted, "dight" (or adorn) the work. Here are no specifications or bills of quantities, children of modern suspicion, but a large and free order to dight, and dight, doubtless, William did, though his handiwork has gone from our ken. His pay for the work was good, 25 marks (or £16 13s. 4d.), but his honour greater, for he was to get a gown and hood, doubtless a token, as Mr. Kelly suggests, of his mastership. Nor were his comforts forgotten, for daily he received a penny for his "noynsankis" "noon-shenk" or noon-drink, *vulgo* beer-money.

Enquiries Answered.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Buildings to Measure in Northamptonshire

PORTOBELLO. — EDINBURGH writes: "Please mention any good domestic work worth measuring in Northamptonshire. Is permission to measure easily obtained?"

See an answer to an enquiry on page 362 of our issue for June 28th, 1905.

Omissions in Quantities.

DORSET writes: "I am carrying out a contract for building a house, and the bills of quantities form the basis of the contract. The job is about three parts completed and I have now discovered that there are omissions in the bills of quantities, and the ultimate cost will considerably exceed the contract sum. (There is no clause in the form of contract that the contractor has examined the plans and verified the correctness of the bills of quantities.) Considerable extra work has also been ordered and done. The architect is anxious to keep down the cost as low as possible and is apparently unwilling to admit that there is any error in his quantities, and will not certify for the full amount of money due to me under my contract. Kindly advise."

You must be quite sure you are correct. If there are extras, of course, they must be paid for and if the architect will not admit them you have a remedy at common law.

Queen Post Truss.

LONDON, N. — CONSTANT READER writes: "What is your opinion on the roof truss shown by the accompanying drawing? It is intended to carry a storage floor loaded up to 1 cwt. per super. Do you think the flitched tie beam and the other truss timbers shown are sufficient to carry the load without being supported from below? The roof trusses are at 13ft. centres. The stanchion under the end of the tie beam is employed for reasons not connected with this problem."

The frame diagram of the truss with ordinary loading is shown in Fig. 1, and Fig. 2 shows the corresponding stress diagram. The vertical weight taken is $\frac{1}{4}$cwt. per ft. sup. and the wind at $\frac{3}{8}$cwt. per ft. sup., horizontal. Some difficulty may be found in drawing the stress diagram as the amounts of the virtual forces 8–9 and 9–10 are unknown. These are due to the truss being a deformable structure and represent the bending effect on the tie beam. The method of working is as follows:—Set down the load line 1–7 and join 7–1, which will give direction of reactions and virtual transverse forces. Draw 2–11 and produce it to meet 6–15. Then draw 15–8 to cut line 7–1 in 8. Next from 4 draw a horizontal to pass through 9 on line 7–1 and 13 on 2–11. Then 14–5 giving 14 on the same point as 13; 13–12, 3–12 to give point 12; 12–11, 2–11, and finally, 11–10, which will then give the amounts of virtual forces 8–9 and 9–10. Fig. 3 shows the frame diagram with the load from floor, and Fig. 4 is the corresponding stress diagram to double the scale of Fig. 2. From the stress diagrams the maximum stresses may be obtained, viz.:—349cwt. compression in the principal rafters, 284cwt. compression in the straining beam, 40cwt. compression in the struts, 145cwt. tension in the queen post, and 308cwt. tension in the tie beam. The tie beam will also be subject to bending moments from the distributed load as shown in Fig. 5. To find the scantling of the tie beam, assume a section composed of two 10″ × 3″ and one 10″ × 4″ with $\frac{1}{2}$-in. flitch plates in between as suggested. Then W from the stress diagrams = 308cwt.; A = $(b+30t)d$ where b = total breadth of timber and t = total breadth of flitch plates, = (10+30)10 = 400 sq. in. taken as all timber; M from Fig. 5=250cwt. ft.=3,000 cwt. in.; and

$$Z = \frac{(b+30t)d^2}{6} = \frac{40 \times 10^2}{6} = \frac{4000.}{6}$$

Then

$$\frac{W}{A} + \frac{M}{Z} = \frac{308}{400} + \frac{3000 \times 6}{4000} = 0{\cdot}75 + 4{\cdot}5 = 5{\cdot}25$$

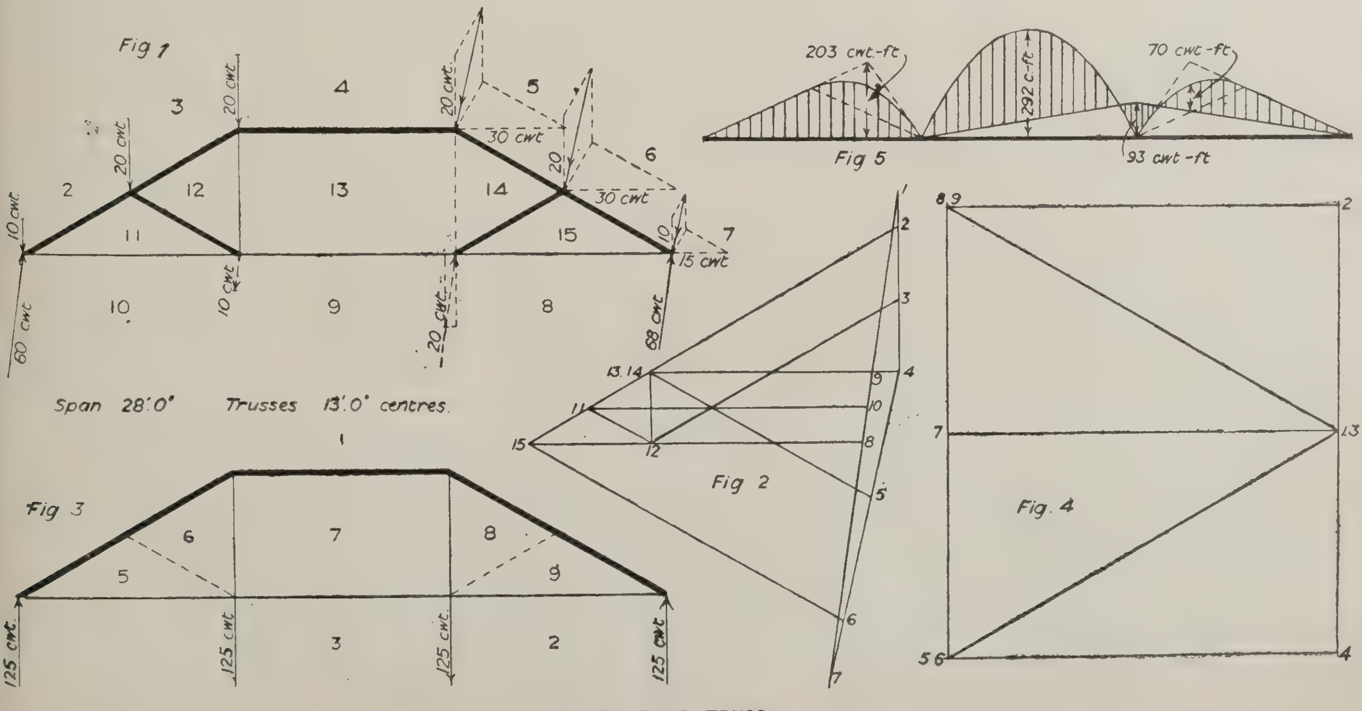
cwts. per sq. in. maximum tentile stress. The breaking weight on pitch pine may be taken as 30cwt. per sq. in. so that this section will have a factor of safety of, say, 6. The principal rafters must be made 12in. by 7in., straining beam 12in. by 7in. queen posts 9in. by 6in., and struts 4in. by 6in., and then the truss will need no intermediate supports from below.

HENRY ADAMS.

Convalescent and Nurses' Home.

FELIXSTOWE.—W. writes: "(1) What price per foot cube would a 'Convalescent and Nurses' Home' cost, the exterior of which will be, comparatively speaking, quite plain? Would 8d. be sufficient? (2) What materials would you advise to be used on the inside walls, floors, and ceilings of the ward-rooms, day-rooms, corridors, dining-room, bath-rooms, lavatories, kitchen, scullery, &c., &c.? (3) Would open fires be suitable for ward-rooms and day-rooms? (4) Is it essential that these rooms be 12ft. high from floor to ceiling, and, if so, should the w.c.'s, lavatories, and bath-room adjoining be that height also? (5) Is it necessary to have 1,440 cubic feet of space per person in the ward and day rooms, and a super. floor space of 120ft. per person?"

(1) Eightpence per cubic foot is sufficient for a building of this class. (2) This is a Convalescent and Nurses' Home and not a Hospital, therefore wood floors are all that is necessary. These would be best in deal, tongued and secret nailed. Ordinary cement plaster, sirapite or other similar material would be suitable for walls and ceilings. (3) Open fires are preferable. (4) Twelve feet is a good height for the rooms mentioned, but this height need not of necessity be retained in w.c.'s, bath-rooms, &c. (5) 1,440 cubic feet per person is excessive. With rooms 12ft. high, a floor space of 100ft. super per person is ample.



QUEEN POST TRUSS.

PROTECTIVE COATINGS FOR IRON AND STEEL.*

By Arthur B. Harrison.

Protective coatings should be divided into three classes, namely: (1) Linseed oil paints; (2) varnish and enamel paints; (3) carbon coatings, using solvents that dry by evaporation. The all-important factor in protective coatings for the preservation of steel is the efficiency, under the actual conditions of exposure as they exist, and not as they should be or as we would like to have them. In actual practice steel is seldom or never properly prepared for coating, mill scale, rust, dampness, and even dirt being more frequently covered up than removed before the coating is applied.

For a great many years this question has occupied to a great extent the minds of the leading engineers of the world, and yet up to the present time it has resulted in little but theorising and temporising, and no definite conclusions have been arrived at, except that all coatings seem to fail in time, and it has come down to one fact, that, as far as protecting the steel is concerned, the only thing to be done is to accept the conditions as they exist and make the best of a rather bad state of affairs.

It was stated by the late Edward Atkinson, of Boston, some years ago that any coating that contained

linseed oil

and dried by oxidation tended to corrode steel. It seems to me that this fact should be absolutely determined, and if after experiments, tests, and chemical analysis this proves to be a fact, it should be so stated, in order that consulting steel engineers can turn their minds into other channels, and upon the most thorough investigation in the laboratory and in the field, and under all possible conditions, find a material that when applied to steel will protect it better than any other material known. In the past, certain weaknesses have been claimed and have developed along the line of

carbon coatings ;

but if comparative results were placed in parallel columns, there is no doubt that the efficiency of carbon coatings would be found far in excess of that of paints containing linseed oil as a vehicle for a protective coating. I know that up to the present time there are certain inherent weaknesses in carbon coatings, and these weaknesses are due to the following reasons:—

There is a tendency in carbon coatings not to oxidise, for the simple reason that there is nothing in the material, generally, to oxidise. There is one reason advanced by some authorities, who seem to give great weight to it and consider it a weakness—namely, that the carbon coating fades and becomes a grey in colour, due to the action of the sun. But there is one fact which they forget, and that is that the manufacturers of carbon coatings do not claim that the material is a paint *per se*. An oil paint upon wood serves two purposes—first, as a coloured surface, and, secondly, as a protective medium, and its failure in either direction would indicate its inefficiency. A coating upon steel, on the other hand, should be simply and solely a protective coating, and the permanency of its colour is a trivial and insignificant matter.

Much scientific, technical and practical data has been given as to pigments, oils, &c.; how pigments should be pulverised to a fineness known as air-floated, ground in pure linseed oil, &c. Whereas, in practice, we find that of the pigments used in paints a great proportion would not go through a sixty-mesh sieve, much less being air-floated.

Result, Inefficiency !

Red lead has been largely used as a preservative coating for steel. In order to obtain the best results and the full efficiency of this pigment, it should be thoroughly mixed with linseed oil and kept well stirred while being applied, small quantities only being mixed at one time. This, we know, is seldom or never done. I have seen some specifications from engineers calling for one helper to stir the red lead for every two brushmen. Other specifications call for the pot of red lead to be stirred between brushfuls when being applied by the painter. This, we also know, is seldom, if ever, done.

The same applies to any paint in which the pigment is much heavier than the vehicle, the efficiency being lessened or lost in the application, in which the poor quality and kind of brush used is an important factor.

In mixing paints, I think too little attention is given by the manufacturer to compounding pigments. A pigment may be absolutely inert in itself, but when brought in combination with other pigments, chemical or galvanic action may begin, and the so-called protective paint becomes a destructive agent when applied to the metal.

A memorandum from an advertisement of one of the producers is apropos here. Many a stately building is built nowadays with

the germs of decay

imbedded in its very skeleton. Even the coatings put on the steel framework to protect it are often themselves producers or starters of decay. The importance of the steel frame of large buildings is so vital that owner and architect alike should be willing to go to any length to assure themselves of its proper preservation.

At a mill on the water-front in Brooklyn, located in the heart of the chemical district, in addition to the atmospheric conditions (being probably the most severe of any part of New York), its little quota is added to the numerous destructive gases from the battery of calcining kettles; in fact. a large portion of the mill is constantly enveloped in vapour heavily charged with sulphuric acid gas from the kettles. The result on corrugated steel roof sheathing, and, in fact, any other steel, was simply appalling, as the steel was eaten away in a very short time. We were unable to buy a paint that would protect this metal under prevailing conditions, even for a few months. As it was a case of self-preservation and protection, I started a series of investigations and tests to procure a coating that would protect. I procured samples of bitumen, hydro-carbon and asphaltum

from all over the world.

After hard work, both practical and technical, and scores of tests covering a period of years, in laboratory and in field, I selected one of these products which seemed to me to have the necessary qualifications to protect steel against corrosion under the most severe conditions.

This material is found in the West and resembles in composition and in many of its characteristics the mineral ozokenite. It is unique among deposits of mineral wax in its adaptability to the formation of a tough, impervious and extremely adhesive coating, with a high degree of elasticity; it lacks the brittleness of many of these deposits and is distinguished from all deposits of what is commonly known as asphalt, by the qualifications just enumerated.

By a special process of refining, this material can be prepared for the market with a very small percentage of residuum, grit and rock, and at the same time valuable characteristics are preserved.

It is my belief that no coating will protect steel against corrosion which is not

absolutely waterproof,

in addition to which it should have the following properties:—The bond between the metal and the coating should be perfect. It should remain elastic under all conditions of temperature, and after it has been applied for years, It should be impervious to acids and alkalies, and should resist the action of all gases. The material should be absolutely inert, and a nonconductor of electricity.

Some authorities state that corrosion of steel is due solely to electrolytic action. I believe that corrosion is greatly accelerated by the action of the electrolite, which, as we know, consists of moisture in any form, and must be acidulated or saline.

Moist air tends to impregnate and saturate an oil paint coating on steel more thoroughly than direct immersion, and after the humidity has been dispelled, the pigment in such a coating retains the moisture and holds it against the steel for many hours. Having finally dried out, it leaves a more or less porous coating, exposing the metal to all the other oxidizing elements. Mr. Wood says: "Rust begets rust, and unless rust is removed from ferric bodies, corrosion will continue even though the surface be covered with a good paint." I have experimented with the above-mentioned material on steel surfaces which were coated with rust to the thickness of from $\frac{1}{64}$ to $\frac{1}{16}$ of an inch. As you know, a large portion of this rust scale is moisture. After coating the surface on which this rust scale was, I allowed the coating to remain for thirty days and then removed the scale, and found there was no moisture left in this scale. Wet iron castings were coated with this material, first rubbing off the surplus moisture with a rag and immediately thereafter applying the coating. An examination of these coatings, months afterwards, proved that they were absolutely free from rust. Had the moisture remained on the surface of the iron, corrosion must have resulted.

After reading the statement made by the late Edward Atkinson, I took up the question of

the oxidation of linseed oil,

having made up my mind that the life of a paint depended upon the life of the oil. The results were very gratifying, because I ascertained by a long series of tests in the laboratory and in the field that I could take linseed oil, and by treating it with certain processes I could prolong the life of the oil, and its efficiency, to such an extent that paint made with it as a vehicle would resist the action of the strongest paint removers, gas drip, benzol, &c., and that a paint made with this treated oil would go over a carbon coating perfectly, without the colour striking through. The co-efficients of expansion and contraction seem to be identical.

---

R.I.B.A. EXAMINATIONS.

Model Answers by A. G. Bond, B.A., A.R.I.B.A.

The Intermediate Examination.

Subject V. — THEORETICAL CONSTRUCTION.

[*Time of Examination one hour and a half.*]

1. *The girder shown in sketch carries a distributed load of one ton to the foot run. Make any comments that occur to you upon the design of the girder and its supports: sketch the general alterations, if any, that you consider desirable.*

In this question, the two points that are chiefly open to criticism are—(in this case a timber beam would be out of the question):—

(*a*) The insufficiency of the depth; the makers catalogues generally suggest that the depth should be at least $\frac{1}{20}$th of the span (to avoid serious deflection), whereas in this case the proportion is

$$\frac{9}{20\times 12} = \frac{3}{80} = \text{less than } \tfrac{1}{26}\text{th.}$$

(*b*) The insufficiency of the bearing on the supports: here we cannot tell exactly the area of the bearing of the ends of the beam on the supports, but even supposing that the width of beam (a compound R.S.J.) were twice the depth—viz., 18ins.—the total area of bending would only be about $\frac{1}{2}$ft. super. at each support, and the load on each support is about 10 tons (or 20 tons per foot super.), and even supposing the bedding of the beam to be perfect and that there is no deflection, this would be excessive.

2. *How is the strength of a beam affected by alterations of* (a) *length,* (b) *width and* (c) *depth?*

In the case of timber beams of rectangular section the strength varies.

(1) Inversely as the length.
(2) Directly as the breadth.
(3) Directly as the square of the depth.

N.B.—This question could be enlarged upon by the student if time permitted, and the reasons given; for instance, in the third case it could be pointed out that on the depth depends not only *(a)* the area of fibre, but also *(b)* the "leverage" or distance of the fibre from the neutral axis —hence its two-fold value in the formula

$$w=\frac{cbd^2}{2}.$$

3. *Give any formula you know for determining the strength of one of the following:—*

(1) A Plate Girder of I section.
(2) A Rolled Steel Joist.
(3) A Rectangular Wooden Beam—and work out an example in figures.

The formula $w=\frac{cad}{2}$ might be used for both (1) and (2) and for (3), the formula given in the second answer—viz., $w=\frac{cbd^2}{L}$ Taking, for example, No. 2, the case given in Question I., and assuming the depth to be $\frac{1}{15}$th of the clear span—*i.e.*,

$$\frac{20 \times 12}{15} = 16\text{ins.},$$

we can use formula $w=\frac{cad}{L}$

$$w=\frac{20\times 5\tfrac{1}{4}''\times 16}{20}=84 \text{ tons.}$$

If 84 tons is the breaking load, the safe load may be taken as $\frac{1}{3}$rd or $\frac{84}{3}$=28 tons.

Where "w"=Breaking Load and "c"= Constant, 20 tons for distributed load. "*a*"=area of flange section (top or bottom), which can here be assumed or $5\frac{1}{4}$ sq. ins. "*d*"=16ins. (See diagram.)

4. *Explain the difference between an "Empirical" and a "Rational" formula, and state to which class belongs the formula you have given in answer to question No. 3.*

An "empirical" formula is one founded on experiment, whereas the "rational" formula is one which is based on mathematical calculation or "pure reason." The formulæ mentioned above are empirical.

5. *Make a diagram showing the stresses upon each member of a King-Post Roof Truss 24ft. span and 30° pitch.*

State the distance you assume for centre to centre of trusses, weight per superficial foot to take, in calculating the load, and what are the scales you use.

The scales for the truss and diagram are drawn under the truss diagram and by the side of the reciprocal. (See diagrams.)

Trusses, 10ft. apart.

Length of Rafter, 14ft. (approx.).

Total load, including wind pressure, may be taken for convenience as $\frac{1}{2}$cwt. per foot super.

$2\times 10\times 14\times \frac{1}{2}$cwt. = total load = 140 cwt. on each truss. (The stresses on the members of the roof can be scaled from the scale line, but are not asked for.)

6. *Why is trouble sometimes experienced through the expansion of concrete in floors and flats, and what course would you adopt to reduce such trouble to a minimum?*

The expansion of concrete in floors, &c., is apt, at times, unless precautions are taken, to cause cracks or bulges in the containing walls.

It has been found that the expansion of concrete due to rise in temperature is practically the same as that of steel, hence the satisfactory working of the "ferro-concrete" principle in construction.

Another cause of expansion is inherent in the nature of cement, which, if above normal temperature, is found to expand considerably on setting. To guard against excessive expansion employ the usual expansion tests and resort to air-slaking where necessary.

R.I.B.A. INTERMEDIATE EXAMINATION: SUBJECT V.—DIAGRAMS RELATING TO QUESTIONS 1, 3, 5 AND 7.

For large floors a judicious sub-division into sections is advisable, and some architects recommend the use of feather-edge wood slips or "expansion-joints" to take up the compression caused by expansion.

When steel-concrete is used in slabs the ends may be supported only and a small space for expansion allowed at the ends; of course, precautions should be taken to see that gauging is carefully done and, if possible, that the work is carried out at a mean temperature.

7. *A cast-iron water tank 20ft. square on plan and 8ft. deep, made of metal, which may be assumed to average 1in. thick, is to be supported on 2 piers built of stock brickwork in blue lias lime mortar each 12ft. high. Give the total weight of the tank with 8ft. of water in it and the size you would make the several piers.*

Disregard the tie-rod and flanges of the tank and also all question of necessary girders.

The position of the piers is here made such as to give each approximately equal loads. (See diagram.)

It is assumed that the tank has no top to it and that it is built of cast-iron plates, weighing 37½lbs. per foot super.

$$\text{Sides}\quad \frac{4\times 20\times 8\times 37\frac{1}{2}}{112\times 20} = 10\tfrac{3}{4}\ \text{tons}$$

$$\text{Bottom}\quad \frac{20\times 20\times 37\frac{1}{2}}{112\times 20} = 7\ \text{tons}$$

The weight of water will be

$$\frac{20\times 20\times 8\times 62{\cdot}5}{112\times 26} = 89\ \text{tons}$$

$$\text{Total load}\quad 106\tfrac{3}{4}\ \text{tons}$$

As there are 9 piers, each will carry half of the load or approximately 12 tons. Allowing as safe load for stocks in lias lime mortar (1 to 2) ¼th of the load at which fracture commences (Hurst gives 24 tons for this) or say 6 tons per foot super. we need in each pier $\frac{12}{6}$ or 2ft. super. of brickwork, which would just about be obtained by square 18in. piers, and as the height is only 8 times the width this result would be quite safe.

8. *What load per square inch would you allow in a strut of Baltic fir about 18 diameters long.*

The amount allowed would depend partly on the shape of section of the strut; for instance, a square strut would take more per sq. in. than a rectangular one.

The maximum safe load to allow when length is inconsiderable would be 15½cwts. per sq. in., but only about half of this would be generally allowed in a strut 18 diameters long.

To prove this by an example and using Euler's formula for a square strut

S=Safe load, $d=4''$, $a=15\frac{1}{2}$ cwts., L=6ft.

4″ × 4″ and 6ft. long.

$$S = \frac{a\times d^4}{L^2}.$$

$$\therefore S = \frac{15{\cdot}5\times 4\times 4\times 4\times 4}{6\times 6}$$

$$\therefore S = \frac{31\times 4\times 4\times 4.}{2\times 3\times 3} = 110\tfrac{2}{9}\text{cwts.}$$

or per sq. in. approximately $\frac{110}{16}$ = nearly 7 cwts.

9. *What is a factor of safety, and what figures would you use in dealing with steel girders and brickwork?*

A factor of safety is the number by which a breaking load is divided to reduce it to the safe load, and it depends largely on individual opinion and the circumstances of a particular case.

Generally for steel girders the manufacturers recommend that the load to be allowed for should not exceed ⅓rd of the breaking load.

Brickwork depends much on quality of materials and workmanship; generally ¼ to ⅕ of the *load at which fracture commences is regarded as safe.*

Subject VI.—Descriptive Geometry: The Projection of Solids.

(June 13th, 1906.)

Time of Examination one hour and a half. [*Not more than four questions to be attempted. Maximum number of marks 50.*]

1. *Draw to ½-in. scale a plan and elevation of twelve steps to a spiral stone staircase forming one complete turn, and indicate by a single line the position of hand-rail against the outer wall. The rise of each step is 7ins. and the diameter of the well is 4ft. 6ins.*

See illustrations.

2. *A wall 3ft. thick has an opening therein 1ft. wide on the outside and 3ft. wide on the inside, the reveals of opening being splayed. There is a semi-circular arch of 18ins. radius over the opening, and the sill of the opening is splayed inwards at an angle of* 30_o. *Draw to 1in. scale internal and external elevations and a section showing carefully the line where the splayed reveals cut the soffit of arch. Draw also the true elevation of the splayed sill.*

See illustrations.

3. *Give an isometrical drawing of the wall-plates, hip-rafters and dragging-tie at the angle of a building, the hip being 9 ins. by 2ins. and the "outer" timbers 4½ins. by 3ins.*

4. *Draw ¼-full-size the plan of the spiral end of a curtail step 12ins. on tread and indicate the position of a newel 2ins. square.*

See illustrations.

5. *A rectangular space, 12ft. by 18ft. as sketch, has a pointed stone vaulted ceiling. The height from springing of arches to crown is 10ft. 6ins. Work out the length of the diagonal and draw the true elevation of the diagonal rib.*

[*N. B. The sketch given was a rectangle 12ft. by 18ft. with diagonals.*]

See illustrations.

Subject VII. — Elementary Applied Construction: The Nature and Use of Ordinary Building Materials.

[*Time of Examination three hours. Maximum number of marks 125.*]

1. *Describe and sketch: Four joints for flooring boards, bressummer, dragon-tie, secret-gutter, soaker, throating, lap and gauge, Lewis.*

1. Floor boards are laid together in such a way as to avoid as far as possible the openings due to shrinkage, and when economy is a consideration they are (*a*) plain-jointed, the edges being shot and the boards pressed together either by folding or by means of screw cramps, or "dogs," in better work.

In higher class work the joints may be (*b*) grooved and tongued; this wastes a percentage of each board, but no actual opening is left by shrinkage and secret nailing is possible.

The waste may be minimised and the actual opening between the boards obviated by (*c*) rebate and fillet joints, another advantage of which is that they allow the maximum wear of boards before the fillet is reached, but secret nailing is not possible.

In the dowelled floors (*d*) secret nailing is possible through the outer sides of each board as it is laid, but as the opening of joints is not prevented by this method it should be used only for hardwood floors or boards in very narrow widths. (See sketches.)

2. *Bressummer*, or breast summer, is a beam used for carrying a "breast" or wall, Such beams are frequently used over shop-fronts and are subject to certain regulations and by-laws as to their distance from centre of a party wall and the bearing at each end. No sketch is needed here.

3. *Dragon-tie* or dragging-tie, a piece of construction used at the angles of buildings where the hip is used as a half-truss to carry a portico, in conjunction with the angle-brace into which it is tusk-tenoned: its other end is halved over the angle-brace and it is morticed to receive the foot of the hip-rafter. (See sketch.)

4. *Secret Gutters* are used at the sides of skylights and in similar situations to conceal the lead dressing, and on the backs of hips and turret angles where the effective appearance of close cutting is desired in the slates or other covering. (See sketches.)

5. *Soaker.* Pieces of lead worked in between slates as they are laid and having one edge turned up under a cover-flashing or apron. (See sketches.)

6. *Throating.* A groove cut near the outer edge of the underside of the projecting part of a sill or coping, &c., to prevent the water falling thereon from reaching the face of the wall. (See sketches.)

7. *Lap and Gauge* refer to the laying of slates. When nailed near the head, the lap is the distance between the tail of any course and the nail hole of the next course but one below it. The gauge is half the difference between the length of the slate (measuring from nail-hole) and the lap.

When nailed near the centre the lap is the distance between the tail of any course and the head of the course next but one below it, and the gauge = half the difference between lap and full slate length. (See sketches.)

8. *Lewis.* A dovetailed arrangement of pieces of iron connected together or in three separate pieces and capable of being let into a corresponding hole in worked stones so that they can be lifted withou damage and dropped into position when the Lewis can be released. (See sketch.)

2. *Where, and why, would you use the following?—Inodorous felt, pugging, cross-bridging, tile-creasing, asphalt, tar-paving.*

Inodorous felt is a bad conductor of heat, and is used under slating, &c., of roofs to preserve a more equable temperature within; it is also used on flats to prevent the projecting edges of boards from damaging the outer covering of zinc, &c.

Pugging is used between floor boards and ceiling below to stop the passage of sound from one floor to another; it may also be used between the studs of partitions for the same reason.

Cross-bridging is used between the joists of a floor when a partition is to be carried by it either at right angles or diagonally, to stiffen the joists and form a firm base for the sill of the partition.

Tile-creasing is used under the course of bricks or blocks used as a coping; it may be also used near the top of chimney stacks or at the junction of a plastered surface with a brick wall, &c., in the last case partly because it acts as a neat method of finishing the junction of surfaces and, in all cases, because, if advantage is taken of the curve of the tiles, it forms a good drip; but probably its primary use is as a damp-proof course to protect the wall below.

Asphalt is used for a variety of purposes—for *paving*, because it presents a fairly elastic, hard, and durable surface; for *roofing*, because it is impervious to moisture. In addition to the reasons just given, for *damp-proofing*, because, in the form of "mastic," it can be melted and poured into a cavity or laid on as an elastic sheeting, such as Callender's.

Tar-paving may be regarded as a substitute for asphalt-paving, and used primarily because it is cheaper than, and in many cases is equally serviceable with, asphalt.

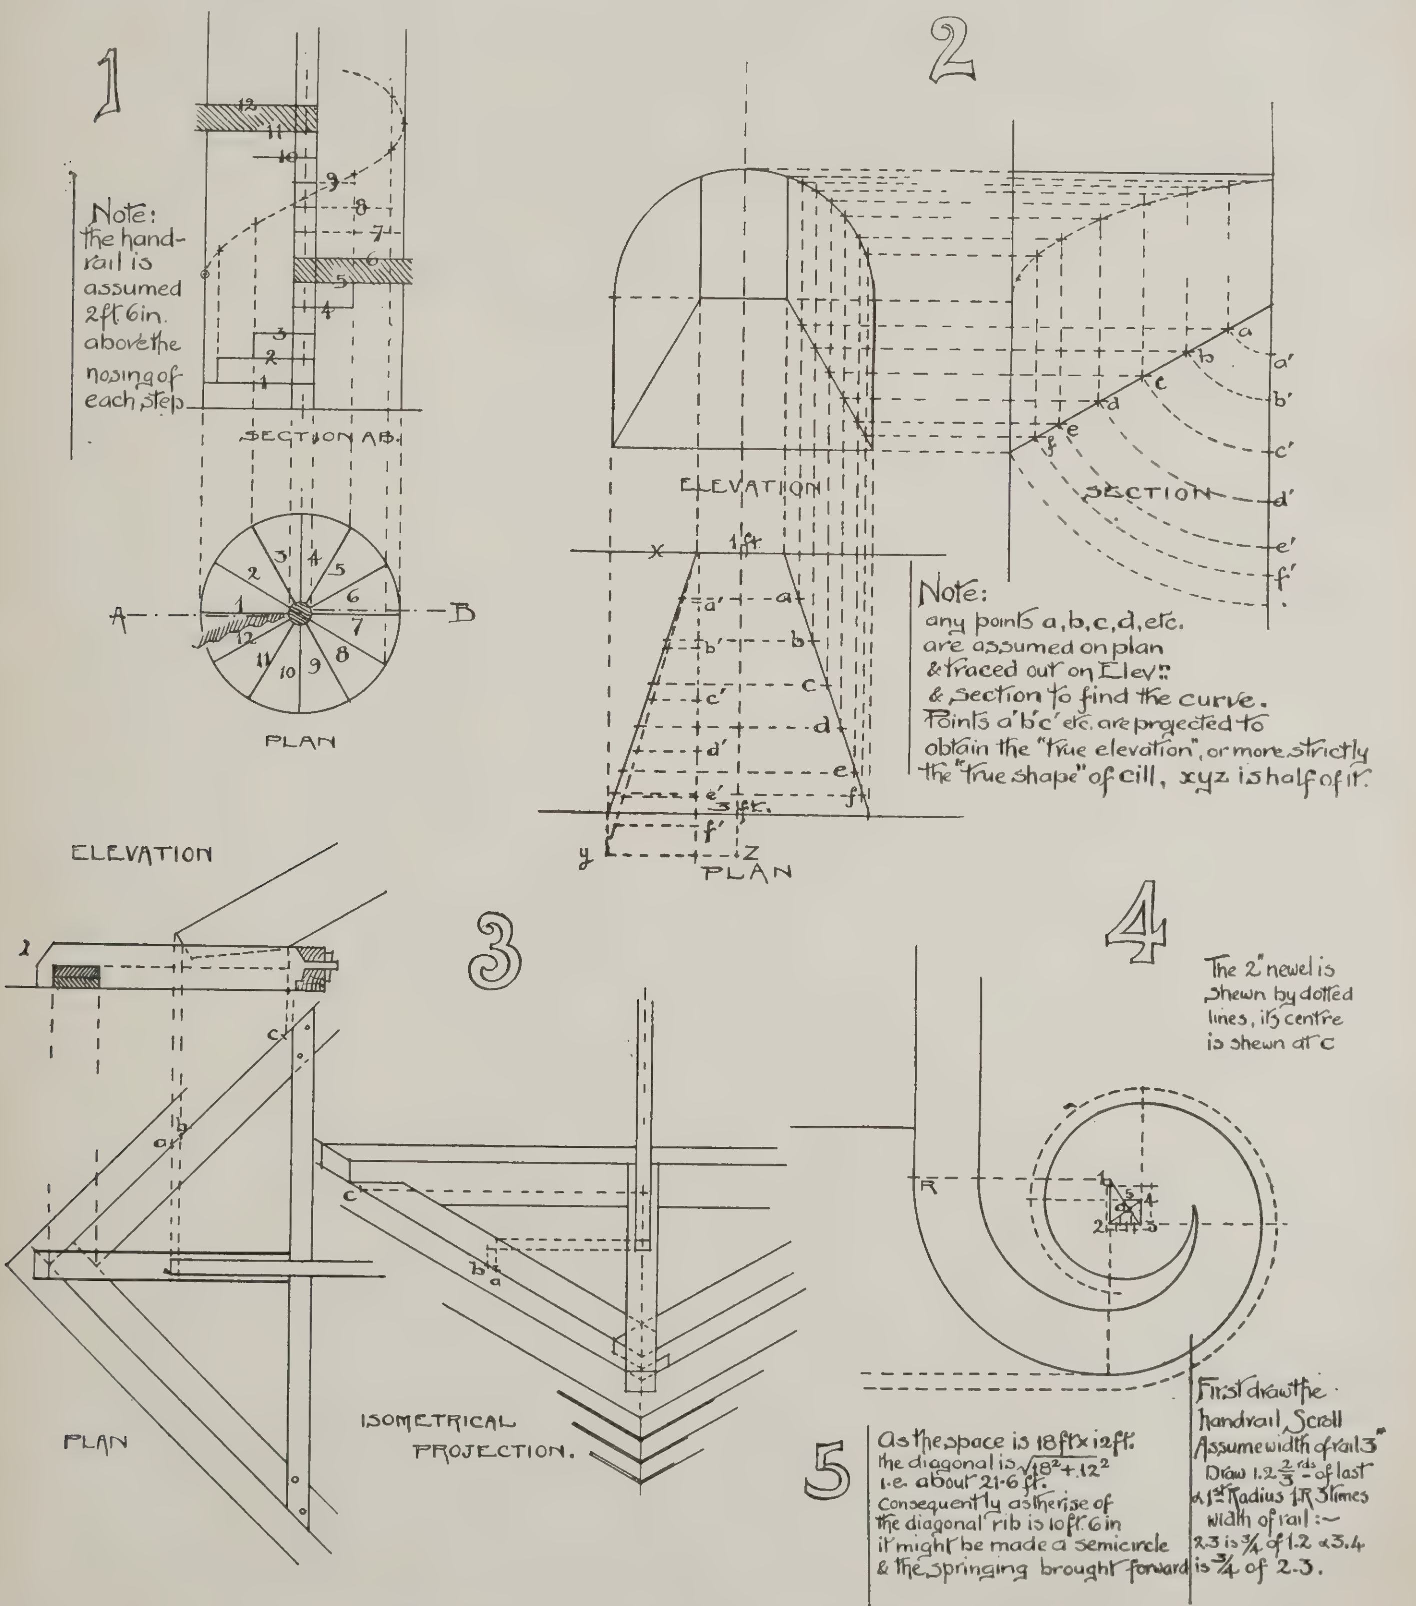
3. *What materials would you consider best for the following? and give your reasons concisely.—A drain under a house, fire-proof partition, a wall to carry heavy loads, soil-pipe. Give, in order of merit, the three different sub-soils you consider best for building on.*

Drains under a house are best constructed of cast-iron pipes treated with one of the usual protective coats (Angus Smith's solution, &c.). They are practically indestructible, and the fewness of the joints—as they are made in 9-foot lengths—renders them less liable to leakage. Some architects prefer stoneware entirely embedded in concrete as being less liable to corrosion.

'*Fire-proof*' *partition.*—There are many patent methods of making partitions at least 'fire-resisting,' and the materials composing them are generally chosen because of their possession of the following characteristics:—

1. Non-liability to disintegration under great heat.
2. Comparatively small *expansion* under heat.
3. Comparatively small *contraction* when suddenly cooled by water.

Materials possessing these qualities to a considerable degree are (1) solid timber, (2) protected iron or steel, (3) terra-cotta, (4) plaster especially if made of asbestos, (5) stock-bricks, (6) concrete (with proper aggregate), (7) slag-wool, (8) coke-breeze. These are not given in order of merit, as



Note: the hand-rail is assumed 2ft. 6in. above the nosing of each step.

Note: any points a, b, c, d, etc. are assumed on plan & traced out on Elev.n & section to find the curve. Points a' b' c' etc. are projected to obtain the "true elevation", or more strictly the "true shape" of cill, xyz is half of it.

The 2" newel is shewn by dotted lines, its centre is shewn at c

First draw the handrail Scroll Assume width of rail 3". Draw 1.2 $\frac{2}{3}$rds of last & 1st Radius 1.R 3 times width of rail:— 2.3 is $\frac{3}{4}$ of 1.2 & 3.4 is $\frac{3}{4}$ of 2.3.

As the space is 18ft x 12ft. the diagonal is $\sqrt{18^2+12^2}$ i.e. about 21-6 ft. Consequently as the rise of the diagonal rib is 10ft. 6in it might be made a semicircle & the springing brought forward

R.I.B.A. INTERMEDIATE EXAMINATION: SUBJECT VI. DIAGRAMS RELATING TO QUESTIONS 1—4.

each has certain qualities which fit it for different circumstances.

For partitions solid timber would be out of the question on account of the expense; protected steel dove-tail sheeting is a well-known form in conjunction with plaster and is strong and very economical of space; stock bricks on edge are cheap and useful, but heavier than hollow terracotta blocks, and not so economical of space—slag-wool is useful for rendering ordinary partitions more fire-resisting and forms a useful fire-proof pugging.

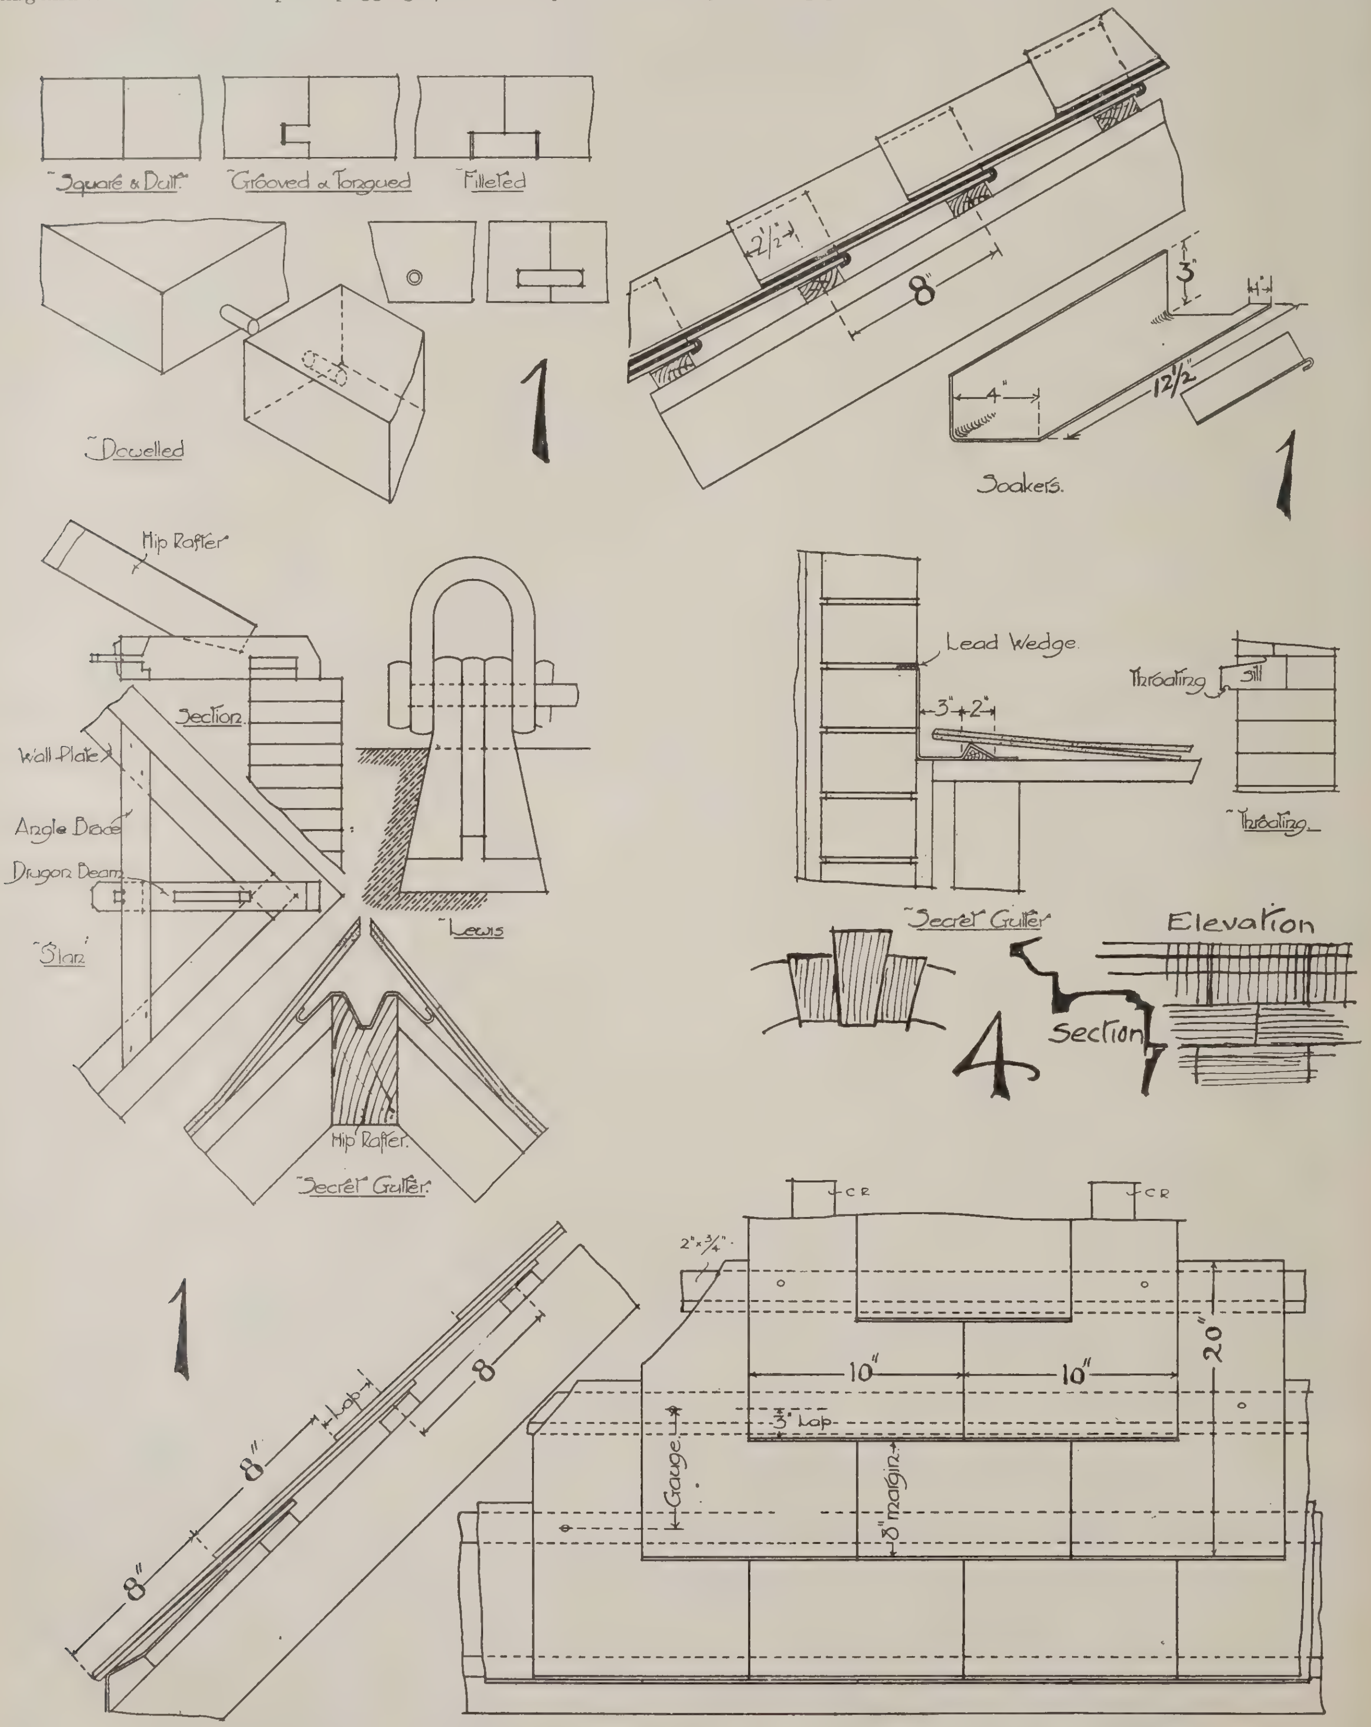
Wall to carry heavy loads.—Probably there is no material superior to Staffordshire blue bricks in cement-mortar; their strength to resist crushing when set in cement is superior to all other classes of brick.

Soil-pipes—these may be constructed either in lead or cast-iron—the latter is considered by some authorities to be superior to lead on account of its strength; lead soil-pipes need protection where a liability to blows exists, but on the other hand the joints necessary in iron-pipes are avoided, and the "wiped" joint is superior to the caulked joint as a permanent water-proof joint.

Lead soil-pipes are generally less unsightly than iron ones owing to the comparative thinness of the material used.

The qualities of sub-soil may be classed under two heads, viz.—(1) strength, (2) sanitary qualities.

Only the first need be considered in answering this question, and the strongest of all soils is *rock* or hard chalk, followed



R.I.B.A. INTERMEDIATE EXAMINATION: SUBJECT VII.—DIAGRAMS RELATING TO QUESTIONS 1 AND 4.

by gravel (which is incompressible when not liable to escape laterally). The qualities of sand and clay as a subsoil are so dependent on the actual circumstances of the case, that it is difficult to say which in a general way is the best, but sand may be excellent if confined laterally, and clay may be thoroughly unreliable if wet and slippery, and is affected by the atmosphere to a depth of at least 3ft. below the surface of the ground—whereas, if at a good depth and fairly dry it may be almost as incompressible as rock itself.

4. *Stone is specified to be laid on its quarry-bed. Give meaning of this and reason, also any exceptions you would make to this rule.*

Most of the ordinary building stones in use are "stratified" or formed by deposit beneath the ocean in layers, and naturally such stones are more capable of carrying weight when it is applied at right angles to the strata—*i.e.*, in the direction in which the material was originally compressed—than when the direction of pressure is in the same plane as the strata. From this it is easy to argue that when pressure is applied obliquely, as in the case of the voussoirs of an arch, the stones should as far as possible be placed with their strata radiating.

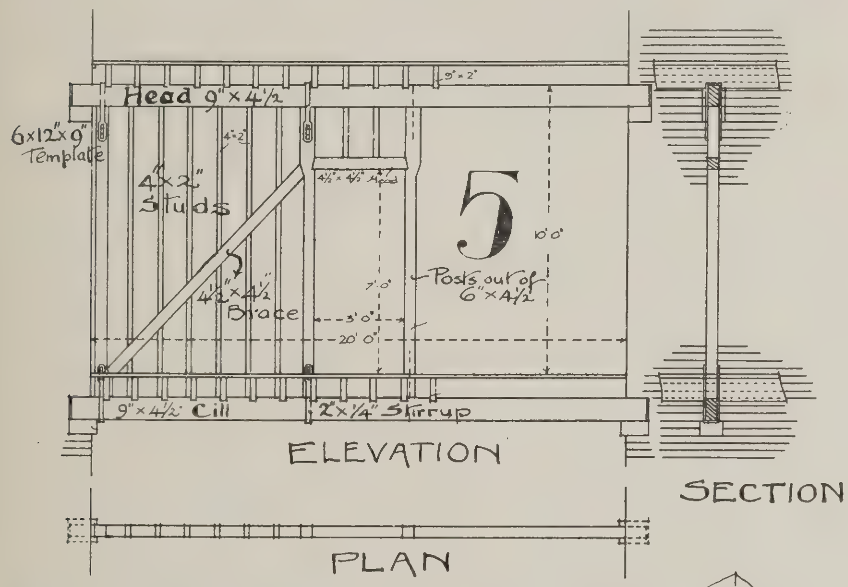
In the case of under-cut string courses, &c., it is better that the strata should be vertical and at right angles to the face of the wall, so as to obviate the flaking of the under surface when alternately saturated and frozen. The sketches indicate the direction of the strata in the various cases mentioned.

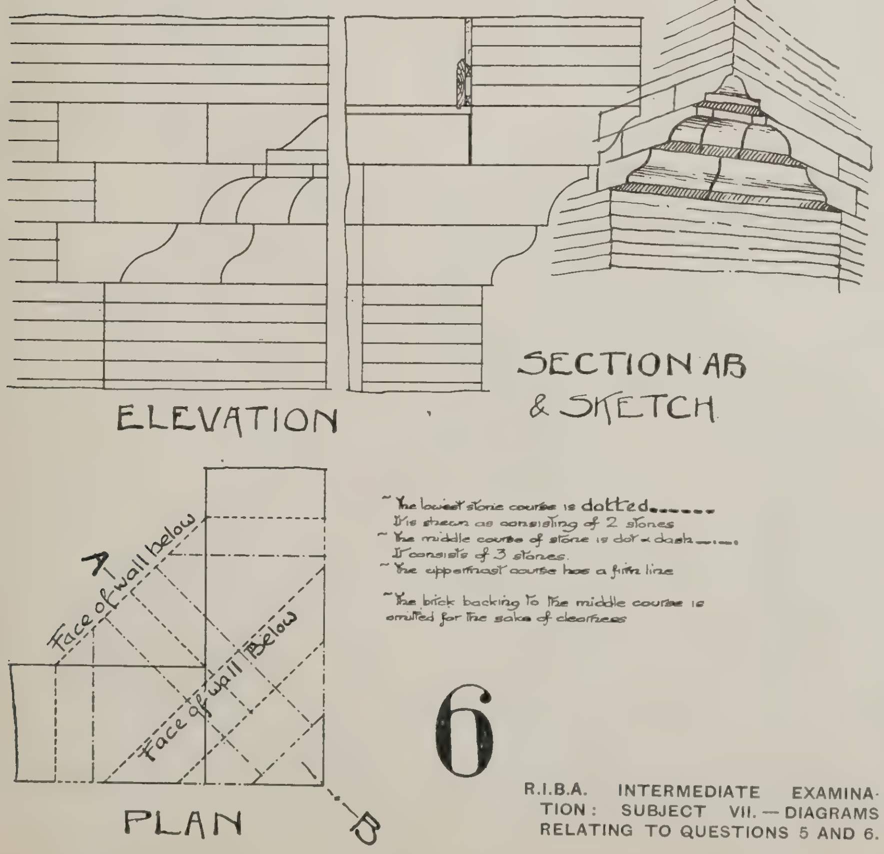
5. *Draw, to ½ inch scale, plan, elevation, and section of a framed partition, 20ft. clear span and 10ft. high, to carry floor over. There is a doorway 3ft. wide and 7ft. high in centre of partition.*

See illustrations.

6. *The angle of a building is splayed 4ft. wide and corbelled out in stone, square over. Draw plans and sections, half inch scale, shewing construction. The floor to be level with top course of corbelling, and all walls are 18ins. thick.*

See illustrations.





~ The lowest stone course is dotted.......
It is shewn as consisting of 2 stones
~ The middle course of stone is dot & dash —·—·
It consists of 3 stones.
~ The uppermost course has a firm line

~ The brick backing to the middle course is omitted for the sake of clearness

Notes on Competitions

The New County Hall.

At last week's meeting of the London County Council the Establishment Committee reported further on the question of obtaining designs for the new County Hall. The committee stated that they were prepared to submit an estimate in respect of the fees to the assessors and competitors, but they would like to have a further opportunity of considering the question of fees to the assessors, so that they only asked the Council at present to approve the estimate in respect of the fee of 200 guineas, which it was suggested should be paid to each of the competitors, not exceeding 23, participating in the final stage of the competition. The committee hopes shortly to be in a position to submit the names of eight leading architects whom they suggest should be invited to send in designs in the final stage. Subject to the Council approving the main features of the suggested competition they proposed asking Mr. R. Norman Shaw, R.A., and Mr. W. E. Riley, the Council's architect, to draw up a schedule of requirements and detailed conditions of the competition. Having conferred with Mr. Norman Shaw, they stated that it will take some time to prepare the detailed particulars of the accommodation required by the Council and the competition conditions, and allowing 16 weeks for the preliminary and 17 weeks for the final stages of the competition, it was anticipated that suitable dates for receiving the preliminary and final designs would be May 7th and October 3rd, 1907, respectively. This report was agreed to, but in the course of the discussion Sir Melvill Beachcroft expressed the opinion that the committee did not provide sufficient information in respect to the cost of the erection. He thought this ought to be fixed definitely, so that architects should know what they might allow themselves to do by way of embellishment. He thought the County Hall should be a fine building, but he was for economy and all he wanted was a workshop. He moved the instruction to add to the recommendation that an important item which would weigh with the Council in accepting designs would be that of economy. This amendment was rejected. Sir T. Brooke-Hitching objected to the invitation of foreign architects when English architects could design such a building as the Houses of Parliament, but Mr. Verney, M.P., urged the council to throw open the competition to all the world. The chairman of the Establishment Committee said that the limit of the cost was £1,100,000.

It is refreshing to see that the press, even those papers like the "Daily News" which support progressive members of the London County Council, should generally object to the decision to invite foreign architects to furnish designs. "The Court Journal" deals with the matter from a rather novel point of view when it says: "The Council has decided to invite foreign architects to send in drawings for the competition that is to be held, and in view of the outcry there would certainly be if foreign contractors were invited to send in tenders for the building, to the detriment of the British workman, the Council evidently has peculiar ideas of the amount of consideration due to rich and poor."

Mr. William Woodward, F.R.I.B.A., F.S.I., writing to "The Standard" with reference to the subject, expresses his agreement with Mr. Horace T. Bonner, whose letter we referred to in our issue of last week, that every competitor should be placed upon an equal footing. He equally objects, with Mr. Bonner, to what he calls "the forcing of our Institute upon the attentions of the London County Council." He thinks that the perfectly fair course to adopt is to allow all British architects to compete in the preliminary competition; then to select from that a certain number to compete in the final struggle. It would be manifestly unjust to allow men who have dubbed themselves 'eminent architects' (nobody else has) to step in, and, perhaps, annex the best ideas of the 'uneminent' strugglers for fame, receive the 200 guineas for the operation, and then get before the assessors with all the ballast they can provide to assist them." Finally, Mr. Woodward adds that he sees no reasonable objection can be taken to the constitution of the assessors.

Model Cottages for Warwickshire.

Miss Edith Bradley, warden of the women's horticultural instruction centre at Providence House, Bredons Norton, announces that with a view to erecting some model cottages on her estate, Miss Z. M. Woodhull wishes to offer two prizes for the best and most suitable model (plaster or wood) of—(*a*) a detached cottage (brick or stone), to cost £300 to £400 when erected, site being given; (*b*) a pair of cottages to cost from £500 to £600. Each cottage must contain three bedrooms and bath-room, living-room and parlour, kitchen, scullery, and offices. The first prize is £15, the second £10. As an undertaking will be given that the cottages will be erected at Bredons Norton, after the two prize models, within six months after the Agricultural, Market Gardeners' and Cottagers' Industrial Show for Bredons Norton and District on August 21st, at which the models must be exhibited, the competition is worthy of attention.

Bethania Church, Maesteg.

Bethania Church, Maesteg, require plans for the extension of their hall and chapel. So commences an announcement in the local papers addressed "To Architects." The plans, *with terms for carrying out the work*, are to be sent in not later than the 18th inst. The first announcement did not appear until the 21st ult. This interesting competition is for extensions of Bethania Hall and Chapel (Baptist) and is being conducted on those strictly economic lines which seem to belong inevitably to works of this description. There are no conditions worthy of the name. Some of the requirements are stated in writing upon a sheet of note paper, others are to be explained upon the ground. It is evidently intended that the architectural treatment of the exterior shall be informal, for "the front is to be taken down and rebuilt in rock work with two or three entrances, *No Tower*." There is no professional assessor, no premiums, no undertaking that the author of the selected design will be entrusted with the work, and no statement of cost. The best rock work design at the lowest terms will, no doubt, win; but it was hardly necessary for Bethania Church to address their advertisement to architects, and, it is to be hoped, the promoters of the competition will not be a prey to the delusion that architects have taken any part in the proceedings. The promoters have shown much wisdom in choosing the rock work style for the treatment of the designs, for this is a style which may be handled with facility by any aspirant after fame upon the lowest cash terms.

List of Competitions Open.

DATE OF DELIVERY	COMPETITION.
—	COTTAGE HOSPITAL, LYDNEY. Cost £1.000. Premiums of £5 and £2. Particulars from T. A. H. Smith, hon. secretary Hospital Commitee, Lydney, Glos.
—	MODEL VILLAGE at Brodsworth, near Doncaster, consisting of 500 cottages, club house, and shops. Design of cottages to be submitted with plan of model village, which will cover about 70 acres. Particulars from the Brodsworth Main Colliery Co., Ltd., Duckmanton, near Chesterfield.
Aug. 18	CHURCH EXTENSION, MAESTEG, Particulars from T. Rees, secretary Bethania Chapel, Maesteg, Mon.
Aug. 21	CEMETERY AND CARETAKER'S HOUSE, STEWARTON. Particulars from James Kerr, clerk to Parish Council, Stewarton, R.S.O., Aryshire.
Sept. 20	SCHOOL AT SUNDERLAND. Limited, to local architects. Premiums of £5o, £20 and £10. Particulars from John W. Moncur, borough engineer, Town Hall, Sunderland.
Sept. 21	Convalescent & Nurses' Home at Glossop. Premiums of £20 & £10. Particulars from Mr. T. W. Ellison, Town Clerk, Norfolk Chambers, Glossop.
Sept. 28	SEWAGE DISPOSAL SCHEME FOR ELLESMERE. Premium of £20. Particulars from R. E. Lloyd, Clerk to Urban District Council, Ellesmere.
Sept. 29	REBUILDING OF HENSHAW'S BLIND ASYLUM AT MANCHESTER. Limited to Manchester architects. Premiums £100, £50, and £25. Assessor, Mr. John Holden, F.R.I.B.A.
Oct 1	ALPHABET COMPETITION. Prizes of £20, £10 and £5. For particulars see "Architectural Review."

Views and Reviews.

Brick Bond.

Mr. Robert Williams has had a good deal of practice in Egypt, and he has published, for the information primarily of the bricklayers—native, French and English—in Egypt, this book on bond in brickwork. The lettering on the drawings and dimensions being printed in English, French and Arabic, it may find a vogue beyond Egypt itself. Mr. Williams refers, in his introduction, to the remains of the vast brick walls of Karnak and the extensive granaries of Thebes. These were constructed of sun-dried bricks made of Nile mud. He also reminds readers that building laws were in existence, at least, so far back as the time of Khammurabi, King of Babylon, 4,000 years ago. One of these laws directed that if the walls of a house fell and killed the inhabitant the builder of the wall should also be killed. There is no such severe law in Alexandria or in Egypt to-day. For the benefit of those architects who may have to practice in Egypt, Mr. Williams refers to a pocket book of Engineering Formulæ by Ibrahim Effendi Zaky, which is published in Arabic. This book illustrates building construction and bond in brickwork. The bricks used for the better work in Alexandria to-day are imported from Marseilles and measure 21½ by 10 by 6½ centimetres. The diagrams are drawn to a large scale and are therefore clear. Brickwork bond is, however, rather troublesome to work out from diagrams as ordinarily shown, and it would be preferable if the diagrams of different courses were printed on separate sheets of tracing paper so as to make it possible, by either laying them on top of each other or by having them bound permanently in this form, to show clearly the manner in which the succeeding courses break bond.

Notes on English Bond," by Robert Williams, F.R.I.B.A. Alexandria: Whitehead, Morris & Co. (Egypt), Ltd. London: B. T. Batsford; price 4/- net.

Complete List of Contracts Open.

WITH a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

August 10. Cranworth.—*Proposed alterations* to Cranworth School. Tenders are required for the above, not later than August 10. Plans and specifications may be seen at the School any day after school hours. Tenders should be addressed to the Rev. A. Tayler Hodgson, Cranworth Rectory, marked on the outside, "Tender for Alterations."

August 10. Cwm.—*Erection of a house and surgery* at Cwm, for the Ebbw Vale Doctor's Fund Committee. Plans and specification may be seen and further particulars obtained at the office of H. Waters, architect, Beaufort, Mon. Sealed tenders, endorsed "Tenders for House and Surgery," are to be in the hands of T. J. Rees, secretary, 27, Alexandra Street, Ebbw Vale, on or before August 10.

August 10. Strathspey.—*Mason, carpenter, slater, plumber and lath, plaster and concrete works of electrical power house, motor house, and men servants' house, to be erected at Dalchroy, Advie, Strathspey*, for G. F. M'Corquodale, Esq. Plans and specifications can be seen with A. Maitland & Sons, architects, or James Gilbert, Seafield Estate Office, Grantown-on-Spey, and tenders to be lodged with the architects, on or before August 10.

August 11. Aberfan.—*Erection of hall at Aberfan* for the Trustees of the Methodist Church. Plans and specifications can be seen at the office of W. Dowdeswell, architect, Treharris. Tenders, endorsed "Hall," to be sent to the Rev. Moses Davies, Aberfan Road, Aberfan, on or before August 11.

August 11. Tregavara.—*Addition to the Wesleyan Sunday School* at Tregavara, in the parish of Madron. The plans and specifications may be seen at the office of the architect, Victoria Square. Sealed tenders, endorsed "Tender for Tregavara Sunday School," to be sent to J. Caldwell, Victoria Square, Penzance, on or before August 11.

August 11. Seaford, Sussex—*Boarding house proposed to be built at Seaford*, for the Seaford West Co., Ltd. Names of intending contractors to be submitted to W. Lambe, Estate Office, Claremont Road, Seaford, from whom schedules of quantities may be obtained in due course on a deposit of £3 3s., sent to the above address, sealed and endorsed "Tender for Boarding-house," not later than August 11.

August 11. Camborne.—*Erection and completion of the proposed residence at Basset Road, Camborne*, for John Whilworth, Esq., according to plans and specification, which may be seen by appointment at the offices of S. Hill, architect, Green Lane, Redruth, from whom all particulars relating to the work may be obtained. Sealed endorsed tenders are to be sent to the proprietor, Lloyd's Bank, Camborne, on or before August 11.

August 11. Braemar.—*Executing the mason, carpenter, smith, slater, plumber, plasterer, glazier and painter works, electric light wiring and fittings, electric bells and window blinds, of proposed rebuilding of the west wing of the Fife Arms Hotel, Braemar*. The plans and conditions of contract may be seen with, and schedules of quantities obtained from Kelly & Nicol, architects, 367, Union Street, Aberdeen. Sealed tenders are to be lodged with W. Macintosh, Fife Estate Office, Banff, on or before August 11.

August 11. Whitburn.—*Erection of a new house to be built at Whitburn* on a site adjoining their Whitburn branch store. Plans may be inspected and bills of quantities obtained on application to the Secretary at the Marsden Stores, Marsden, between 2 p.m. and 5 p.m. Sealed tenders, endorsed "House, Whitburn," must be delivered at the Marsden Stores not later than August 11, addressed to the Secretary of the Marsden Industrial and Provident Society, Ltd., Marsden.

August 13. Pontlottyn.—*Erection of two houses at Farm Road*, Pontlottyn, for Messrs. Lewis & Morgan, Pontlottyn. Plans and specifications may be seen of P. V. Jones, architect and surveyor, Hengoed, via Cardiff. Endorsed tenders to be sent to him on or before August 13.

August 14. Dublin.—*Erection of a dwelling house and out-offices*, to be built at Cookstown, Tallaght, Co. Dublin, in accordance with the drawings and specification of Doolin, Butler & Donnelly, architects, Dawson Chambers, Dublin. Drawings, &c., can be seen at the architects' office. Tenders to be delivered to the architects on or before August 14.

August 15. Bishop's Stortford.—*Erection of buildings and foundation for* carburetted water gas plant for the Bishop's Stortford and District Gas Company. Copies of drawings and specifications can be btained from J. W. Portass, Gas Works, Bishop's Stortford, on payment of £1 1s. Sealed tenders ddressed to the Chairman of the Gas Company, and ndorsed "Tender for Carburetted Water Gas Buildngs," must be delivered at the Company's Office, 16, Water Lane, Bishop's Stortford, not later than August 15.

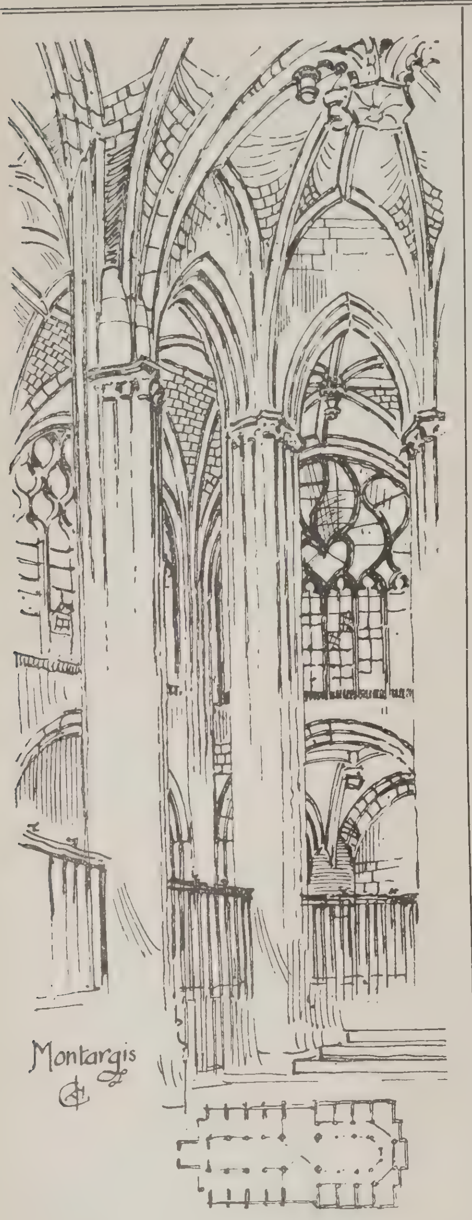
The Inner Nature of Strain. THE ultimate laws of stress and strain are subjects of interest to all concerned with construction; and, therefore, the contribution to the molecular theory of the inner structure of metals by Professor J. A. Ewing, LL.D., F.R.S.. M.I.C.E., in his presidential address to the Engineering Section of the British Association was distinctly welcome. It certainly marks an advance in the direction of a more rational understanding of the nature of the phenomena, it points the way to a simplification of the analysis of stresses and strains in structures, and it removes some of the ignorance we are accustomed to gloss over with factors of safety. Professor Ewing and Mr. Rosenhain, some years ago, showed how stresses in metals produced changes in their crystalline structure, and, working upon this line, Professor Ewing is able to state a fair working hypothesis. Briefly stated, his theory is as follows: Metals are congeries of a multitude of grains, everyone of which is a crystal, although the boundaries of each grain have none of the characteristics of geometrical regularity which one is apt to look for in a crystal, but the grain is a true crystal for all that. Its boundaries have been determined by the accident of its growth in relation to the simultaneous growth of neighbouring grains. Within each grain however, the growth is regular. Professor Ewing uses the simile of a nursery in which several children start at random piling bricks side by side, each in geometrical regularity of orientation until each pile meets other advancing piles, until the whole space is filled. The whole solid mass he conceives as containing as many grains as there have been nuclei from which the growth began. In general, quick cooling means that crystallisation starts from many nuclei, and the resulting grains are consequently small; with slow cooling a gross structure of large grains is obtained. The process of annealing consists in raising metals to temperatures at which recrystallisation may take place, though the metal remains solid while this internal rearrangement of its particles goes on. Now, when a piece of metal is strained beyond its limit of elasticity, the permanent set resulting is caused by the yielding that takes place by means of slips between one and another portion of each crystal grain. In other words, the plasticity which a metal possesses is due to the possibility of shear on certain planes in the crystal that are called "cleavage" or "gliding" planes. When metals are strained they first pass an elastic stage where there is no permanent set; beyond this they slip. Professor Ewing suggests that this may be explained by assuming the molecules of a metal to possess magnetic polarity equally in three directions defined by rectangular axes. He assumes the molecule has six poles—three positive and three negative—and that these repel the like and attract the unlike poles of other molecules. The molecules have envelopes which may turn on one another without friction. Crystal building consists, therefore, in bringing molecules into conjunction so that they shall be in a position of maximum stability under their mutual attractions. Professor Ewing showed by means of models and diagrams how molecules in a group might be displaced from the position of maximum stability and yet possess some stability. Straining action in the elastic stage, Professor Ewing suggests, is similar to displacing such systems by sliding molecules on each other a small way, insufficient to break bond. Beyond the elastic stage he suggests the molecules step forward along the plane of sliding, so producing permanent set, and in settling down again the chances are against their taking up their normal orientation. The molecular constitution of the metal in the region adjacent to a plane of slip is now uncertain and patchy, including parts whose stability is less than normal. A touch would make them tumble into positions of greater stability. This is what we find in reality—at the critical point there is a big yield which will not be stopped by reducing the amount of the straining force. A slow, creeping action continues after the straining force has done its main work, which Professor Ewing ascribes to this breaking up of the more unstable groups formed during the first stage of the slip. These unstable groups will prevent the metal recovering its perfect elasticity until it has had a long rest or been annealed. Professor Ewing also shows how the theory will account for the fatigue of elasticity when a straining action is frequently repeated. Experiments show this action to begin with slight slip on surfaces where the strain locally exceeds the elastic limit. An alternating stress makes the surfaces slip backwards and forwards sufficient to cause them to lose their crystalline grouping, and so lose the cohesion due to strict alignment of molecular polarity. He suggests that whereas in normal crystallisation each molecule touches six neighbours, under strong compelling forces the molecules may be piled up pyramidally, so that each molecule touches twelve others. This would mean that increase of density and rarification took place locally. This would account for increase of density in wire drawing and for the development of cracks through alternations of stress. Such theoretical reasoning gives us a clearer notion of strains resulting from stresses in structures. Molecular conceptions are pretty certain to be very different to reality, but we must make assumptions for the purpose of analysis, and Professor Ewing's is so simple as to suggest its sufficient accuracy as a preliminary to future investigation.



Montargis

St Remy Dieppe.

SOME NOTES ON TROYES AND ITS CHURCHES.

By C. A. N.

(PART II.)

(Concluded from page 65, No 600)

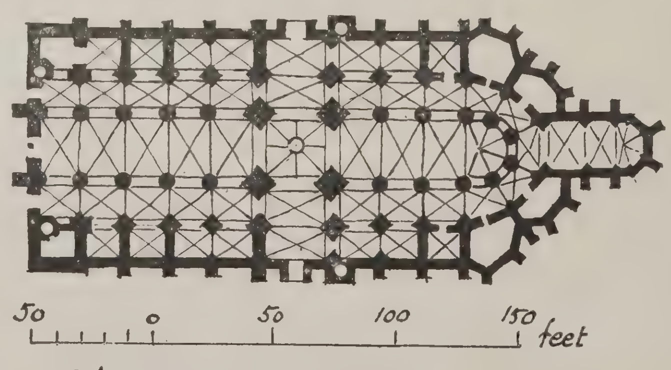
Like our own perpendicular, the Flamboyant style in the hands of a commonplace artist is very often ungraceful and capricious—it is so in many French churches both in the towns and in the villages, but in the hands of a master it may become a style of the utmost beauty and refinement, as for example, in the rood-loft of the Madeleine and the west front of the cathedral.

The choir of St. Jean and the churches of St. Remy, St. Nizier, St. Nicholas, St. Martin, and St. Pantaléon at Troyes, illustrate very completely the transition from Flamboyant to Renaissance ideas in this particular part of France, where Gothic traditions died hard. Here we have in St. Martin's a church begun upon essentially Gothic lines in the middle of the sixteenth and completed, according to the original designs, in the seventeenth century, while even the eighteenth-century clearstory of St. Pantaléon is far more Gothic than Classic in all essentials.

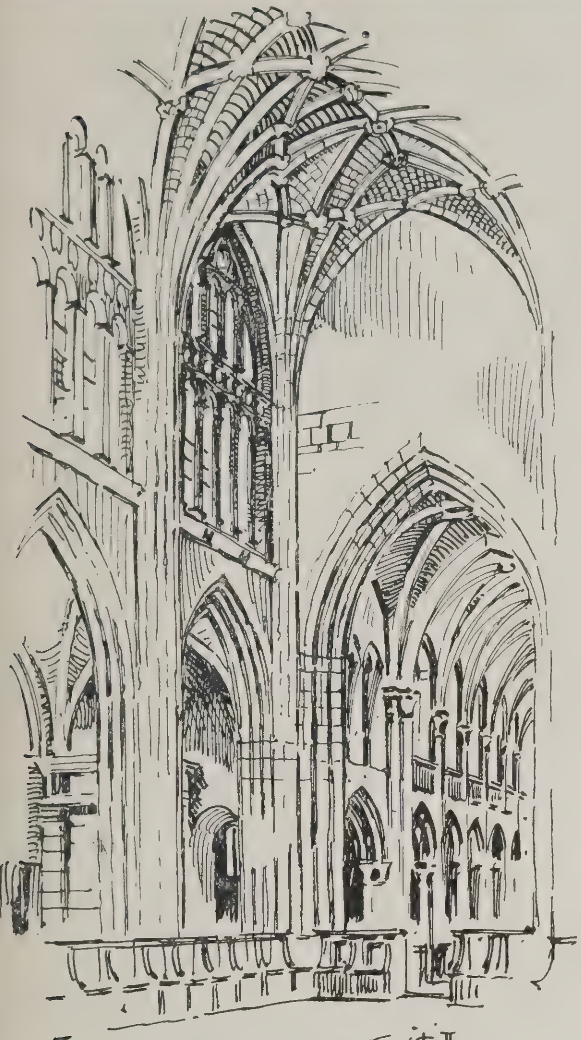
In other parts of northern France we find similar survivals of Gothic ideas in the churches that were built before, under the influence of the Jesuits, the native building tradition was displaced in favour of a more cosmopolitan architectural style founded upon the debased Italian rococo work of Bernini and his followers. A good specimen of Gothic survival is the cathedral at Orleans, the rebuilding of which was begun in the seventeenth century at the charges of King Henry IV., in whose reign certain parts of the Paris Louvre were being built with great two storeyed pilasters in the style of St. Peter's at Rome. At Dieppe the church of St. Remi, begun in 1522, was not finished till 1651; its impressive vaulted interior is almost purely Gothic in detail, excepting the moulded capitals of the round nave columns, and the transept was rebuilt as late as 1743 in the same style as the rest. St. Eustáche at Paris is rather earlier in date, but its detail is more classical and the medieval constructive system has been forgotten or else abandoned by its builders. The Renaissance churches at Troyes resemble more closely the contemporary work at La Ferté near Le Mans, particularly in the arcaded traceries of their clearstories, and the chevet of the church at Montargis near Sens is of somewhat similar character. This church is not very often visited by travellers, but it is certainly of considerable interest. It has a late twelfth-century vaulted nave of four bays with aisles, clearstory, and short transept. The choir is sixteenth and seventeenth-century work, with aisles of its full height and low chapels beyond, under large clearstory windows. The clearstory follows the lines of the apse and the effect of its wide windows seen through the tall narrow arches of the ambulatory is very striking. As in several of the Troyes churches, the chapels are enclosed in a rectangular wall following the line of the street, so as to avoid curtailing the length of the main avenue of the church. The detail is inferior to that of contemporary work at Troyes, but the general arrangement is interesting and suggestive.

To return to Troyes; in the sixteenth century a very lofty and imposing choir was added to the earlier and simpler nave of St. Jean's church. The outer walls of its chapels follow the street frontages without regard to the axis of the church, and in consequence there is much variety in the design of the flying buttresses and the treatment of the successive bays. Here the ground storey, with immense windows in the side chapels, is tolerably pure Flamboyant work; the clearstory and vaulting are Renaissance. A transept was begun but never completed, hardly any two bays of the vaulting are alike; in the south-east chapel the vault ribs form an open skeleton, the vault itself being a plain dome riding clear of the ribs. There is a little good seventeenth-century grisaille glass in the clearstory, and the eastern chapels contain some full coloured windows of the previous century. The effect of the apse is spoiled by a tall Rococo reredos, but the church contains a quantity of old woodwork, and its tall lantern-like choir forms a picturesque termination to the long, low, and somewhat dark nave.

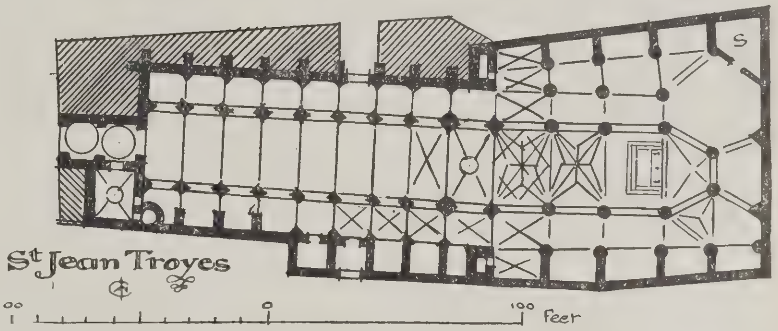
St. Remy, St. Nizier, and St. Martin, all good sized vaulted churches, were not completed until the end of the sixteenth century. The nave and crossing at St. Remy are fourteenth-century work, the choir and vaulting very late Flamboyant. St. Nizier is Flamboyant with a Renaissance clearstory and west end. St. Martin, which is entirely Renaissance, is in some respects the most interesting of these three churches. Their plans are alike in essentials, each of them has the flush transepts, and side chapels between the aisle buttresses which are characteristic of late Gothic town churches in France. Their chesets are all set out according to a method which was adopted by the builders of the church at Caudebec, near Rouen. The choirs end with an ordinary transverse vaulting rib, and beyond this is a three-sided apse surrounded by three approximately hexagonal chapels. The choirs of the Madeleine and St. Jean, and the somewhat smaller church of St. Nicholas, are planned in this fashion, with apses having three vaulting bays only instead of five or more, as in most French examples, and here, at Troyes, in the cathedral and St. Urbain's church. In vaulting a three-sided apse with ordinary radiating ribs, it is, of course, necessary to make some provision against the



St Remy Dieppe



St Jean Troyes



St Jean Troyes

westward thrust upon the keystone of the apse vault. The devices adopted in the cathedral and St. Urbain's have the effect of shortening the apparent length of the church, and the radiating ribs have the disadvantage of masking the clearstory windows of their apses. The Renaissance* builders managed to avoid both these difficulties by finishing their choirs with an ordinary rectangular vaulting bay and transverse arch and vaulting their apses with quadrilateral vaults of irregular plan with four main diagonal ribs, meeting in a keystone east of the chord of the apse. The easternmost pair of ribs being much shorter in span than the others and springing from a higher level, do not mask the central windows of their clearstories. The apse vault of St. Remy is simpler and even more ingenious than those of the other late churches in Troyes. Here a barrel vault commences at the chord of the apse, the springing of which would naturally rise along the canted bays, the crown remaining level. This barrel vault is cut into by "Welsh groins" over the side windows; the ribs at the angles of these groins abut upon a short segmental rib parallel with the east window, and, consequently, this apse has two keystones instead of only one.

The high vaults in the naves and transepts of these late churches are all of a uniform pattern. The ribs in each bay form a four-pointed star, the transverse arches are very deep and prominent, and the diagonals are slightly heavier than the intermediate and ridge ribs. The ridge ribs only occur between the main keystone and the intersections of the intermediate ribs and the vaults are considerably domed up, the central keystone being well above the point of the transverse arch in each bay. The division of the vaulting into bays is thus marked in an unusually prominent manner, and the general effect is thus entirely different from that of many English vaults of almost identical plan, in which the general surfaces are continuous and the ribs are all more or less in the same plane. The contrast is the more apparent from the method of filling in the vault cells adopted at Troyes, where each cell is closed in with small stones very much domed up, whereas in an English "lierne vault" the cells are almost always filled in with long flagstones. The fillings of the late vaults at Troyes are laid without much apparent system and some very unusual arrangements are found; in one instance the filling stones are laid in a spiral fashion ending in a keystone in the centre of the vault cell. Pendant keystones, which are common in Renaissance vaulting in other parts of France, are not much used in Troyes, probably on account of the scarcity of building stone of good scantling, but there is a rather fine example in the apse of St. Martin's Church. Although the high vaults of these churches are all very much alike, their aisles are often vaulted with ingenious, but

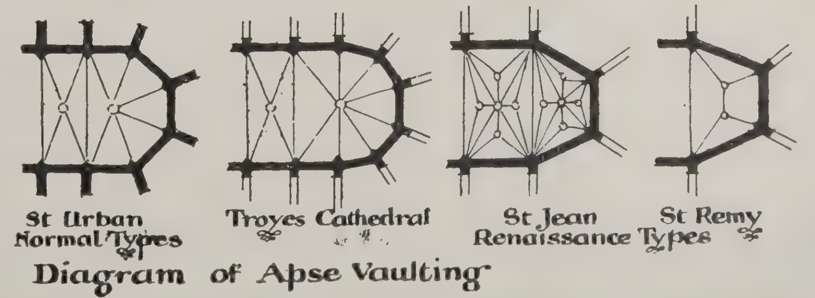


Diagram of Apse Vaulting

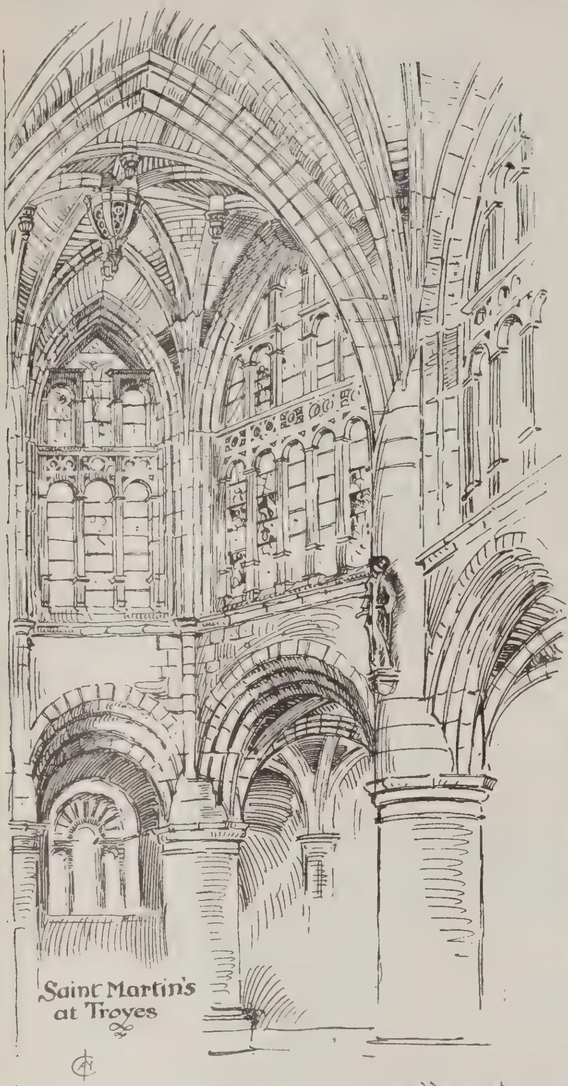
---

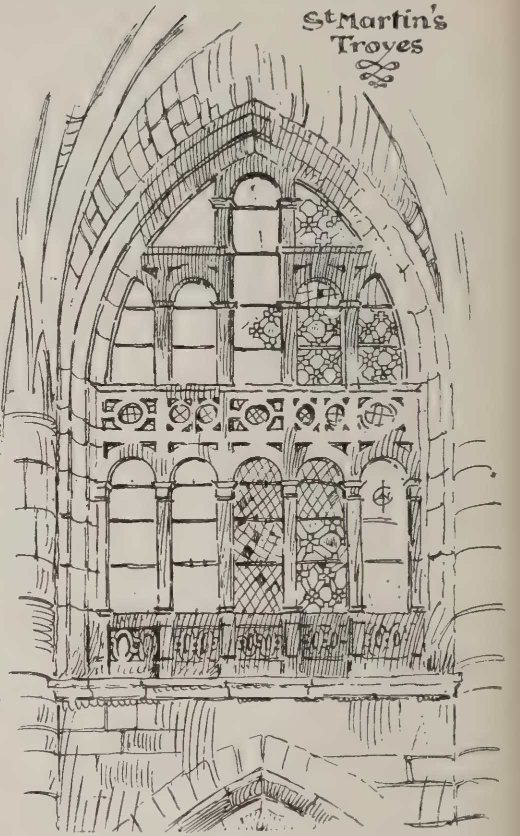
* The term "Renaissance" is here applied to the transitional style which survived in the provinces of northern France until the middle of the seventeenth century. The leading features of the churches of this age are almost invariably traditional as opposed to "foreign" or "classical."



Saint Martin's at Troyes

St Martin's Troyes

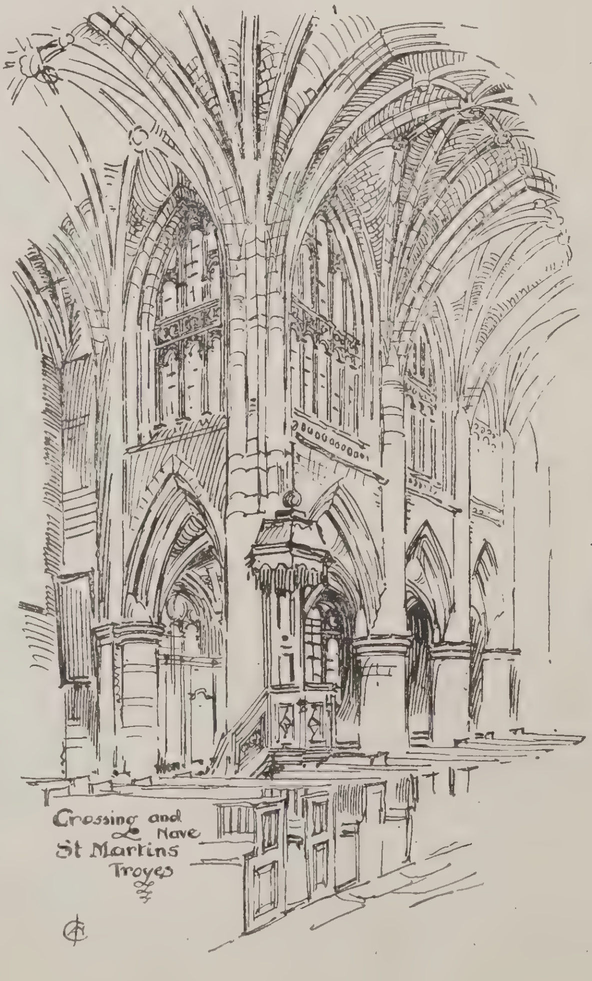
St Martin's Troyes



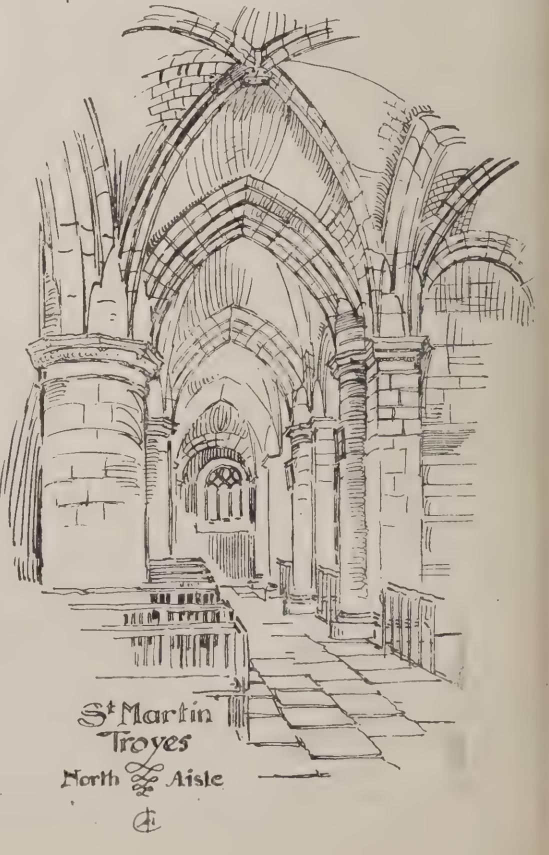
St Martin's Troyes

apparently somewhat purposeless, combinations of ribs according to the caprice of the individual builders. Thus at St. Pantaléon each oblong bay of the aisle is divided into two long triangles with a bold diagonal arch, the triangular compartments having each a tripartite vault with a keystone. The vaults of St. Martin's Church, which appear to be the most modern in Troyes, are more decidedly Gothic in character than many of the other examples. Here the aisle vaults are plain quadripartite and very much domed, almost "early" in effect. And in the high vaults, although the ribs are clumsily set out and intersect ungracefully at the springers, yet they are built in the early Gothic manner with the lower joints horizontal up to the level at which the ribs diverge sufficiently to clear each other.

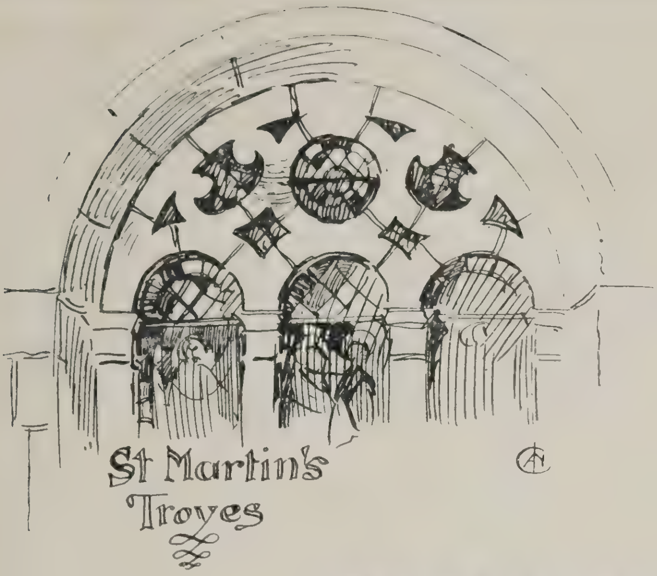
Almost all the late churches at Troyes stand well, and have escaped any serious distortion on account of settlements. St. Nicholas is, however, an exception to the general rule. It is vaulted on the same plan as the others, but with round instead of pointed arches, and, as is also the case at Saint Eustáche, at Paris, the circular vaults have bulged the clearstories and caused some very unsightly settlements. The fact is, of course, that the semi-circular form is unsuitable for the transverse ribs of a Gothic vault, because it generates diagonals of a weak, flattened, semi-elliptical shape, and because an arch of low curvature exerts a considerable thrust in proportion to the span, while the least

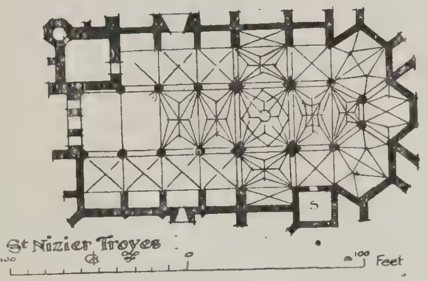


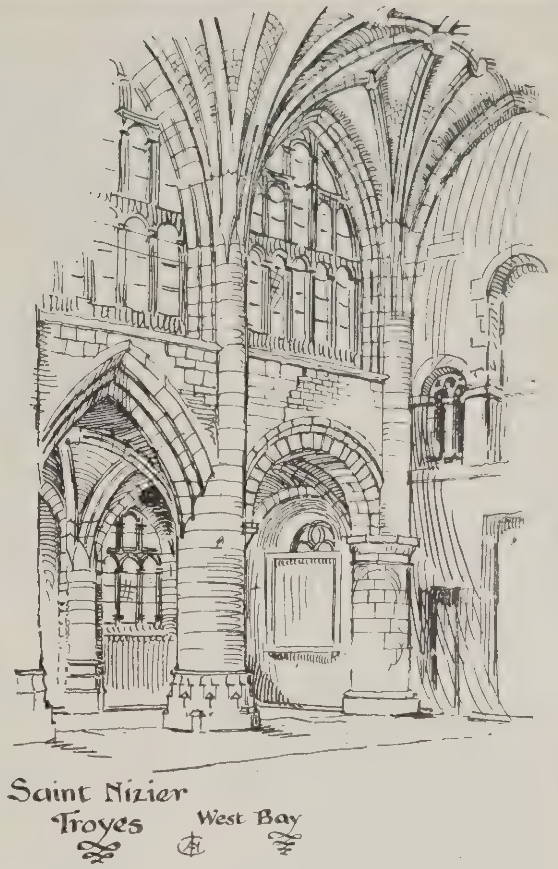
Crossing and Nave St Martins Troyes



St Martin Troyes North Aisle

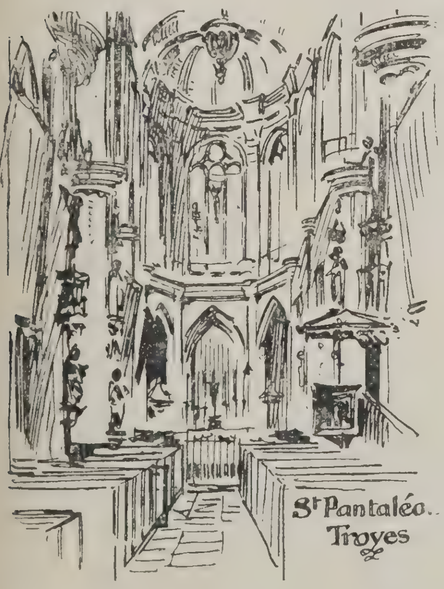


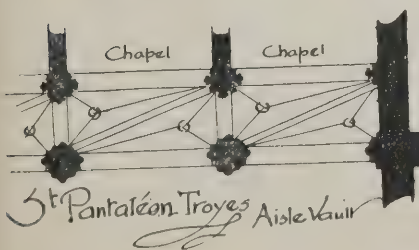




settlement necessarily causes a marked depression at the crown and a proportionate rise at the haunches, whereas a slight settlement in a pointed arch is far less noticeable, partly because the two halves of the arch more or less pivot upon the springers, and so accommodate themselves to any slight increase of span caused by the yielding of the abutments, partly also because slight irregularities of form are less evident in an intentionally broken curve than in a simple mathematical figure, such as the semi-circle or the ellipse.

The church of St. Nicholas is, however, a fine and interesting one in spite of its poor construction. Its apse would be similar to those which have been last described, but the ambulatory and chapels are cut off by a flat wall immediately behind the east window of the clearstory. There is thus no central chapel behind the high altar, and the two side chapels are of very irregular plan. At the west end is a very late two-storeyed Narthex, the upper stage of which forms a Calvary, and is approached from a large flight of steps occupying the greater part of the south aisle of the nave. In the north aisle is a curious temple-like structure representing the Holy Sepulchre—a winding staircase in this aisle is carried upon a corbelling of curiously interpenetrated Flamboyant mouldings finished with a kind of flourish—where they meet the wall, and, as in most of the churches of Troyes, there is some good late glass.





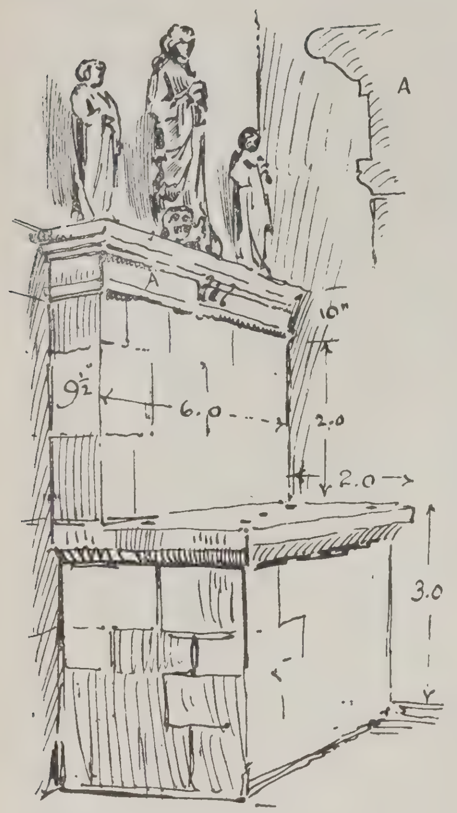
The larger village churches in the neighbourhood, such as those of Pont St. Marie, St. Savine and St. André, are built on a uniform plan and date from the fifteenth and sixteenth centuries. They have nave and aisles of equal height, vaulted from round pillars without capitals, flush transepts, polygonal apses to their choirs, and chapels between the buttresses of their aisles. Pont St. Marie has a stone tower with slated spire at the north-west corner, St. Savine a timber central saddleback tower, St. André a flèche. These churches are gloomy and not particularly interesting, though they contain some old glass and some picturesque seventeenth and eighteenth century fittings. At St. Savine, for example, several of the chapels retain their old altars, above one of which is a sixteenth century painted retable* on which stand three old painted images. St. André, too, has an old retable with carved bulging columns, not unlike English Elizabethan work, in its south-east chapel, and over the north-east altar in the same church some old Gothic tabernacle work has been incorporated in a modern retable. Here, too, the pulpit is late Gothic woodwork, and some sixteenth century paintings, which apparently once served as retables to the lesser altars, are preserved in the north aisle of the nave. Pont St. Marie church is less interesting than the others, but the vaulting is prettily treated in the north aisle, and the gables of the west front and the transepts have overhanging timber work like many of the old houses in the city.

All these churches have bits of Renaissance work generally about the doorways, contrasting quaintly but not unpleasantly with the Flamboyant detail of the surrounding features. Like most of the old churches in the district they are all three filled with eighteenth century pews of dark brown woodwork.

The church of St. Pantaléon in the Rue de St. Paul ends the list of the ancient churches of Troyes. Begun in the year 1516, upon the site of an older wooden church, it was probably injured by a disastrous fire in 1524. The work was recommenced in 1536, but was carried on in a very leisurely fashion, and not completed for over a century. Its plan is of the usual local type, rectangular in outline with chapels between the buttresses and flush transepts; on all four sides the church abuts upon narrow streets, and the east wall forms a tangent to the curve of the apse, as is the case at St. Nicholas. The church seems to have been temporarily roofed in at the level of the aisle vaults, the lower stage of the work being of late Gothic character with pillars of wavy section, capriciously planned vaulting in the aisles, and Flamboyant traceries in the windows. Above the arches, a heavy classic cornice runs right round the interior, and is bowed round the vaulting shafts; this cornice forms a gallery and is provided with an iron railing. The vaulting shafts run up between tall round-headed clearstory windows to the wall plate, where they terminate in coarse Corinthian capitals at the angles of the crossing and carry a stone entablature somewhat similar to the balcony below. The apse clearstory is circular, the lower stage being polygonal; the round-headed windows have Renaissance traceries and Corinthian pilasters in

---

* The term "retable" is used in its proper sense denoting a "reredos" and not a ledge for ornaments



17th Cent. Altar
St Savine
Troyes

place of vaulting shafts. The church was designed for vaulting, and flying buttresses were commenced, but never completed; the present ceiling is a ribbed barrel of oak, with a semi-dome over the apse and a groin at the crossing. It has a large and elaborately-carved oak pendant in the apse, and is now of a soft greyish colour which tones very well with its surroundings.

The general proportions of the church are very tall and narrow, especially in the transept, where it is possible to shake hands across the projecting balconies. Upon the piers are a double series of stone statues under very delicate and rich canopies, the upper series of figures being on a smaller scale than the lower ones, and under the pier arches large oil paintings are hung between beams reaching from pillar to pillar. The position of these paintings is most unusual, and, although they have no great merit in themselves they contribute a good deal to the effectiveness of the interior by partially screening the aisle windows and giving the nave the effect of being lighted almost entirely from above.

Several of the chapels contain nice pieces of tabernacle work and sculpture, the most interesting being a group in the south-west chapel, formerly the oratory of the Shoemakers' Guild, representing St. Crispin at his trade, with several other figures. This is carved in the round, nearly life-size, and painted; it stands under a very pretty Gothic canopy over the site of the former altar of the chapel. The west bay of the south aisle is occupied with a large Calvary group, not very old, but of some interest. On the west wall is a staircase and a Gothic gallery, on the balustrade of which are two half-length figures of high priests watching the scene below.

In such a church as this, where so much old work has been spared, it is disappointing that the rood-loft has been destroyed and that the altars are all modernised. Unhappily, there is scarcely an important church in France which retains its rood-loft; scarcely an altar which has not been rebuilt or else mutilated so as to accord with the theatrical ideals introduced by the Jesuits of the seventeenth or eighteenth centuries.

So we may take our leave of the churches of Troyes in thankfulness that they have at least been spared the crowning degradation of a garnishing of medieval stencil work and that the Calvary at St. Pantaléon has not been cleared away to make room for a grotto of Lourdes.

Views and Reviews.

Small Houses.

The author of this little book has set before him the tasks, firstly, of compiling a guide for the client to the line of thought generally adopted by the architectural profession on the subject of building a home, and secondly, limiting the discussion to houses costing not more than £1,000 each. The book, as expressly stated in the preface, is not intended to be for architects or for speculators, but for those who wish to build for themselves. The author, who is an architect, says, "It has ever been the case since the architect became a professional man, and ceased to employ his own mason, that one of his chief difficulties has been to impart to his client a proper understanding of the building he proposes to erect. Plans and elevations give a diagram of the dry bones; a perspective view may give the general outline, but neither of these will carry any conviction to the lay mind without some vision of life as it will be in the completed building, or unless each drawing and architectural conversation carries with it the scent of real bricks and mortar. The result of this difficulty has been twofold. On one side it has spread an unwholesome view of what domestic architecture means, and on the other side it has produced apathy, and eventually ignorance, on the whole subject." The book must, of course, be judged from the standpoint from which it is written, and, so far, we think that it is, on the whole, to be commended. Certainly, the illustrations contained in the book cannot be taken exception to. They are all houses that are simple in design and well proportioned. Several well-known architects have provided illustrations of houses designed by themselves, such as Mr. Guy Dawber, Mr. E. J. May, and Mr. Ernest Newton. The author discusses sites, planning, exterior effects and materials, interior effects, and kitchen quarters in a series of chapters, following which there is a chapter on pipes and electric wiring, the last information being contributed by the Rev. J. S. Martin, formerly engaged as an electric light and telephone foreman under a London firm of engineers. The concluding chapter is one on the alteration of old houses. From this summary of the contents the character of the book is obvious. The author has written the book in a clear, straightforward style, easily understandable by the client, and it will form interesting reading to architects, for, although almost all the author has to say is commonplace information to professional readers, it may serve to remind them of some points that are apt to get lost sight of, and perhaps offer a few hints. In the appendix the Royal Institute of British Architects' schedule of fees is given so that clients may be in a position to know what they are expected to pay an architect.

"The Small House: its Architecture and Surroundings," by Arthur Martin. London: Alston Rivers, Ltd. Price 2/- net.

Mr. Walter Emden, J.P., the well-known West End architect, who has now retired from business, has presented his business to his four principal assistants—namely, Mr. S. H. Egan, Mr. W. S. Emden, Mr. A. J. Croughton, and Mr. T. C. Ovenston, who will now carry on business at the same address under the name of Messrs. Emden, Egan, & Co.

Correspondence.

"A Preliminary to Registration."

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In your comments upon a letter from me which lately appeared in the *Freeman's Journal* you seem to take exception to my praising the action of the Chief Secretary, Mr. Bryce, in adding a clause to the new Labourers (Ireland) Act, requiring that persons appointed as architects, engineers, surveyors, or clerks of works shall satisfy the Local Government Board of their fitness for their respective positions. I ventured to deprecate the action of the *Freeman's Journal* in denouncing the Chief Secretary for introducing this small measure of justice. You go on to regret that the duty of determining whether a man is qualified or not should fall upon a department llke the Local Government Board. I am quite in agreement with you that that Board would not be a suitable examining machinery for such a purpose; but they already have powers to determine whether a dispensary doctor or a midwife is qualifield or not. The Board conducts no examination, they simply determine on the testimonies of study before them whether such candidates are genuine practitioners or simply quacks. The only difference is that while with doctors or midwives there is a recognised minimum standard, in architecture there is none. Perforce, then, the Board will have to adopt a rough and ready standard of its own. I quite agree with you that in the absence of a recognised diploma of some sort it would be better to delegate the duty of sifting the pretentions of candidates to some better qualified body, such as the Institute of Architects. Failing that, however, Mr. Bryce's clause is a most valuable concession if the Local Government Board administer it with firmness and decision.

It is evident from the tone of your remarks that you in England have little conception of the extent to which men who have never studied architecture for a single hour engage, and often successfully from a financial point of view, in architecture, in the provinces particularly.

I have before me a cutting from a provincial paper which records the election of an "engineer" to a certain rural District Council. Tenders were invited for the post, and the two lowest were respectively £25 and £14! Both gentlemen had backers on the Board, but the strongest recommendation put forward for the £14 man was that he was "the son of an extensive ratepayer," and by another backer "that he was a young man seeking an opening." The merits or qualifications of the candidates were apparently never even mentioned! and the £14 man was duly elected. It must be remembered, too, that in provincial Ireland the term engineer comprehends architect and surveyor as well. The candidate elected will in this case, in all probability, have to do any and every kind of work usually done by engineers, architects or surveyors to such bodies, including most likely the supervision of a large number of cottages built under the Labourers Act. Of the abilities of this particular gentleman I know nothing, but a man who offers to undertake the duties of such a post for £14 a year does not rate the value of his professional services, it must be admitted, at an exorbitant price. Such cases are, however, common enough.

I will only add that the Labourers Act, although it has received the Royal Assent, will not come into force until April 1st next (auspicious date!), and meanwhile the Local Government Board, the sanctioning authority, have no power to veto, even the most glaring jobs.—Yours etc.,

R. M. BUTLER, Architect.

DUBLIN.

[The Board can only enquire into a proposed architect's experience, but this will play into the hands of established architects, and not afford a young man qualified, but with little or no practice, a chance. The only logical course is to require an examination diploma.—ED., B.J.].

A Correction.

In the letter addressed to us by Messrs. Young & Hall, and published on p. 65 of our issue for last week, a word was omitted by the printer in the seventh line from the end. It should have read: "There are always two kinds of cases which could *not* be removed."

IN PARLIAMENT.

(By our Press Gallery Representative.)

Regent Street Quadrant.

In the House of Commons Mr. Fell asked the Secretary to the Treasury whether it was proposed by the Commissioners of Woods and Forests to rebuild Regent Street with a colonnade on each side; and, seeing that the original colonnade in the Quadrant was removed as it was found to be objectionable and to render the shops too dark, and that colonnades were out of place in this dull climate, and were never built now even in the City of Paris, whether he will give this proposal his most serious consideration before agreeing to it.

Mr. M'Kenna in reply said he understood that there was no intention of rebuilding the street with a colonnade.

The Millbank Art Gallery.

Mr. P. W. Wilson asked the First Commissioner of Works, whether it was proposed to utilise the space behind the National Gallery of Art, at Millbank, for the purpose of building a new Stationery Office or other Government office; and, seeing that such building, if erected, would render it impossible to make additions to the Art Gallery, which was becoming overcrowded with pictures, whether he would consider the advisability of reserving this ground for the extension of the Gallery.

Mr. Harcourt said that the reply to the first paragraph was in the affirmative. In accordance with the scheme sanctioned by his predecessor, it was proposed to build the Stationery Office upon the vacant land behind the National Gallery of Art, at Millbank. The extensions originally contemplated when the site was offered by the Government to Sir Henry Tate in 1893 had already been made. He would make inquiry as to the future needs of the Gallery, and would reconsider the matter before next year's estimates were framed. He might mention that some space was still reserved for the purposes of the Gallery.

Westminster County Court.

Mr. Nield asked the First Commissioner of Works whether it was intended to rebuild the Westminster County Court, and if so, when such works of rebuilding were likely to be commenced; whether plans had been prepared of the proposed works, and if the same had been approved by the local authority and by the judge and officials of the court; and if not, whether such approval would be required before the building was commenced.

Mr. Harcourt said the reply to the first paragraph was in the affirmative. The work of rebuilding would be begun so soon as the contract could be made. Sketch plans had been prepared and had been seen by the judge and registrar of the court, and the building would be carried out as far as possible to meet their wishes. He was unable to give any undertaking such as was suggested in the concluding paragraph of the question. The local authority had no jurisdiction.

Phoenix Park Glass Houses.

Mr. Field asked the Chief Secretary for Ireland whether he could state under what circumstances contracts for the erection of glass houses in the Phœnix Park, Dublin, were given to a Scotch firm, and whether Irish firms were invited to tender for the erection of these houses.

Mr. M'Kenna in reply stated that these houses were urgently required and that the work was of a special character as regarded the design, the details of construction and the arrangements for ventilation. In these circumstances the Board gave the contract, after being satisfied that the terms were reasonable, to a firm of well-known specialists in this kind of work, who had executed contracts in the past to the Board's entire satisfaction. There were considerable building works in connection with the erection of the glass houses, and these, he understood, had been carried out, either by Dublin contractors, after tender, or by the Board's workmen.

Foreign Cement.

Mr. John Ward asked the President of the Board of Trade whether he could give the number of tons of foreign cement imported into the United Kingdom in 1905, and the countries from which such cement came; also whether he could give the names of the firms in this country to whom the cement was consigned, the ports at which it was unloaded and stored, and the work upon which such cement was used; whether he was aware that the great bulk of such imported cement was retailed as British Portland cement; and what action, if any, he proposed to take to protect the public from fraud of this character.

Mr. Lloyd-George replied in the following terms:—A statement has been prepared and will be communicated to the hon. member giving all the information available as to the quantity of cement imported from foreign countries into the United Kingdom at the various ports during 1905. The names of the ultimate consignees of the cement cannot be given, as the law only requires the names of the importers or agents to be furnished in the "entries." Imported Portland cement bearing marks implying that the goods are of British manufacture would be required to have these marks duly qualified, so as to afford a definite indication of the country of origin, in accordance with the requirements of Section 16 of the Merchandise Marks Act, 1887. As to retail sale, a false trade description would appear to be applied if foreign Portland cement were retailed as British, and it would be open to anyone aggrieved to take action under the Act referred to.

THE TIMBER TRADE.

London Market in July.

The record of the wood trade during July may be considered satisfactory on the whole, in that buyers in the country generally have found a readier market than usual for their early purchases, and have confidence enough in the future to contract for their late summer and autumn requirements at the higher range of prices now current. This does not apply to the London trade, where the demand still compares most unfavourably with that of 1905, and the deliveries have fallen off no less than 21,000 standards in all for the first seven months of this year. In consequence of this heavy reduction in the demand, merchants have, of course, done a smaller business, but the course of the markets abroad has helped them to some extent, and the trade has been sounder and more remunerative than in some years of big figures. Messrs. Churchill & Sim think that freights are inclined to stiffen a little as autumn insurance rates come nearer, and tonnage is not quite so freely offered.

Messrs. Denny, Mott & Dickson, Ltd., report on Baltic and White Sea goods as follows:—"Business in July has shown some improvement, and as such increase in turnover has been accompanied by a hardening in prices, the outlook is somewhat more satisfactory. Floorings and small-sized scantlings are in demand, and the prices of these show a decided improvement."

The abstract of dock stock, consumption, &c., for July, published by Messrs. Foy, Morgan & Co., is given in the table at the foot of this page.

Dock Stock.

The stock of wood in the public docks on July 31st was:—

	Pieces.
Foreign deals and ends - - - -	1,216,000
Do. battens - - - -	1,427,000
Pine deals and battens - - -	628,000
Spruce do. do. - - -	538,000
Boards, rough - - - -	2,774,000
Do. prepared - - -	5,957,000

totalling 12,540,000 pieces, as against 14,707,000 in 1905, 17,004,000 in 1904, and 17,129,000 in 1903.

In other kinds the stock was as follows:—

Foreign wainscot logs - -	306 pieces.
Do. oak timber - -	359 loads.
Do. fir timber - -	1,703 do.
Do. Oregon pine, &c., spars and masts - -	4,070 do.
Colonial oak timber - -	834 do.
Do. birch timber and planks -	3,983 do.
Do. elm and ash timber -	941 do.
Do. yellow pine - -	704 do.
Do. red pine - - -	32 do.
United States pitch-pine timber	17,277 do.
Do. do. deals -	18,000 pieces.
East India teak - - -	7,592 loads.

Deliveries.

The deliveries have been—

	First seven months. Pieces.	July. Pieces.
Foreign deals and ends -	1,817,000	245,000
Do. battens - -	2,993,000	367,000
Pine deals and battens -	608,000	82,000
Spruce do. do. -	667,000	73,000
Boards, rough - -	2,956,000	398,000
Do. prepared - -	8,010,000	1,163,000
Total - -	17,051,000	2,328,000

The deliveries from ship to craft have been—

	First seven months. P.s.h.	July. P.s.h.
Deals and battens - -	53,993	22,331
Boards - -	12,343	3,129
Total - -	66,336	25,460

Soft Woods.

Sweden.—The importation of Swedish deals in July has been an average one, though larger than in 1905. Battens and prepared boards have also come forward rather more freely, but except for the latter, and for the smaller sizes of scantlings, prices have not responded to the higher levels current at the shipping ports. A fair amount of progress can be recorded during the month in the distribution of what remains for summer and early autumn delivery, but London buyers are inclined to wait for an improvement in the conditions here before entering into further purchases, especially in view of the higher figures which they will have to pay for their stock. There has been little indication of any favourable movement in the South African market, but the decision of the Government in regard to the future political status of the new Colonies will, at all events, clear the air a little, and a return to settled conditions should stimulate business to some extent later on.

From Norway a large supply of floorings has brought the importation up to beyond last year's figures. Norwegian shippers have taken full advantage of the improved prices current in London, although these do not yet compare with those obtainable elsewhere.

Russia.—The supply of Russian deals has been smaller than usual, but ample for the present demands made upon it. Prices in London have not improved during the month except for battens, which are decidedly scarce for shipment. The business for forward delivery has been small and mostly confined to filling up parcels at the full current prices. Shipments continue regularly and with no recurrence of labour troubles so far.

From Finland an average importation, with a fair inquiry for battens, and an eager demand for scantlings, is the record for July. Prices for the latter have moved up a point or two, and the prospective supply of them is small.

From Prussia, in the absence of demand the stock of fir timber has slightly increased, but importation has been on a small scale, and quotations at present are very firm in sympathy with the high cost of pitch pine. Oak has not been in good demand, and the stock is the smallest seen here for many years.

As regards Canada, pine deals have arrived freely during July, but the demand for them continues slow, especially for the higher grades, unless of undoubted quality. Spruce has been in fair demand and with a small importation prices are here and there inclined to harden. The cost of both pine and spruce deals has discouraged new business for forward delivery, but the stock is at present ample for the trade's requirements. Birch planks have been moving slowly and prices show signs of drooping for some sizes which have come forward too freely. The demand for sawn pitch pine continues good, a fair quantity has gone into consumption during the month, and there are signs of a further improvement in the demand. The position of the market has been more settled owing to the renewed firmness of prices at the shipping ports, and the broadening of the demans outside Europe. The importation of deald and boards was considerable in July, and prices are not quite up to the level of the previous month.

Hard Woods.

Mahogany.—The chief feature in this market is the small stock. Messrs. Denny, Mott & Dickson, Ltd., had stated that Cuba wood is very bare in supply, and has risen in price. Tobasco is also short and has hardened. Any revival in the sluggish consumption would cause a very perceptible all round rise in values, seeing that stocks are so bare, whilst forward supplies, as far as can be judged, will be light. Churchill & Sim are also in agreement with this judgment. They state that at the auctions last month the attendance was large, competition active and prices generally had a higher tone. "The arrivals have been very light, and this market is now in the exceptional position of there not being a single entire cargo of mahogany unsold, and it is consequently very favourably placed to receive fresh imports, which are much needed."

Teak.—The most noticeable feature of the market, Messrs. Denny, Mott & Dickson state, has been the pressure to realise Java wood of inferior quality and specification. This description of wood has accumulated in stock, owing to unsuitable shipments having been rushed forward in the expectation that the high prices required for the reduced importations of Burmah and Bangkok wood would ensure an outlet for any kind of cheap teak. Teak, however, is now too expensive to be used for other than high-class work where suitable quality and sizes are imperative, and it is therefore bad policy for the shippers of a comparatively experimental wood like Java teak to handicap its undoubtedly useful qualities by sending forward consignments both inferior in quality and specification to those shipments which originally made the wood well worth the consideration of consumers as at least usefully supplementing the abnormally reduced supplies from Burmah and Siam. Rangoon and Moulmein importations for last month were small, and fell short of the consumption, which, however, was very restricted. Prices remain very firm for first-class wood, but second-class logs are difficult to sell, as the same reasoning applies to inferior Indian wood as to the inferior Java wood.

ABSTRACT OF STOCK, CONSUMPTION, &C., IN LONDON DOCKS, FOR JULY.

All Docks.	Deals (Fir).	Battens (Fir).	Pine.	Spruce.	Pitch-pine Deals.	Deals and Battens in Aggregate.	Rough Boards (All Countries).	Flooring.	Floated Timber.

Enquiries Answered.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Fire-Resisting Floor for Stable.

LONDON, S.E. — BUILDER writes: "Kindly give me scantlings of a 'fire-resisting floor' for a first-floor stable, 27ft. clear span, for *heavy* horses. Also what is the angle and construction of the *run up* for the horses (5ft. wide)?"

The arrangement of the main girders and small cross joists is shown in the part plan Fig. 1. Allowing a load of, say, 3 cwt. per ft. super, including weight of girder and floor, each girder will have to carry, say, 32 tons, requiring two British standard beams (B.S.B. 23), 14ins. by 6ins. by 46lbs. Each of the small joists will have to carry a load of, say, 2½ tons requiring a (B.S.B. 6), 5-in. by 3-in. by 11lbs. joist. Piers 18ins. by 9ins. will be required under the main girders. A section through one of the main girders is shown in Fig. 2, with alternative methods of casing in the joists. The "run-up" for horses to first floor stable should not be steeper than 22½ degrees.

HENRY ADAMS.

Hipped Roof With Stone Slates.

LONDON.—B. P. writes: "(1) Please tell me how best to construct a roof shown (sketch not reproduced) of 26ft. span, pitch 55°, length 51ft., hipped at both ends, covered with extra thick Westmoreland slates (12 cwts. to the square), with rafters at 15° centres spiked at foot to joists at floor level? The chief difficulty is how to support the purlins at the hips. They should take a central position, but a post taken vertically down at this point will entirely cut up the attic bedrooms.

"(2) Can you tell where I can obtain in the neighbourhood of Byfleet (near Woking) stone that could be used for exterior rubble walling, and what quarry would you recommend anywhere in the South of England—but as near Byfleet as possible—where stone slates for roofing can be procured?"

(1) The type of roof shown is very defective as against wind pressure, but there ought to be no more difficulty in putting uprights to the hip and jack rafters than to the others in a similar position, as the wedge end of the floor could not be utilised if they were omitted. The points of support should come under the purlins. (2) Kentish Rag would be an excellent stone for the exterior rubble walling. Stone slates for roofing may be obtained from Stow-in-the-Wold, Somersetshire, but they are rather thick and heavy.

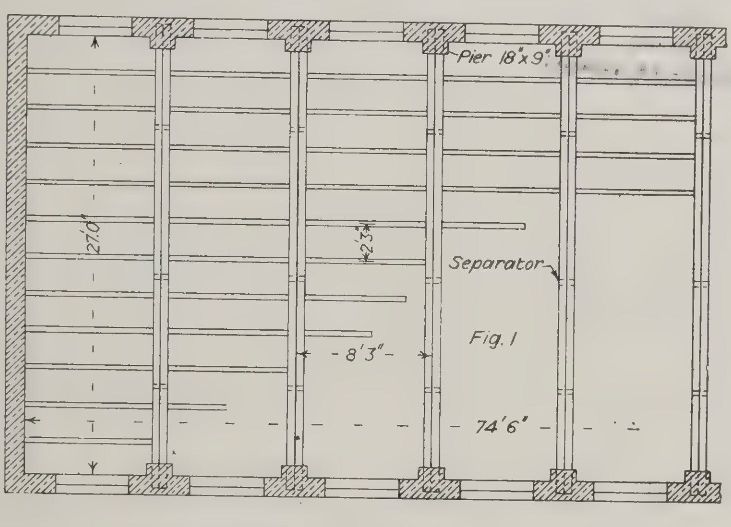
HENRY ADAMS.

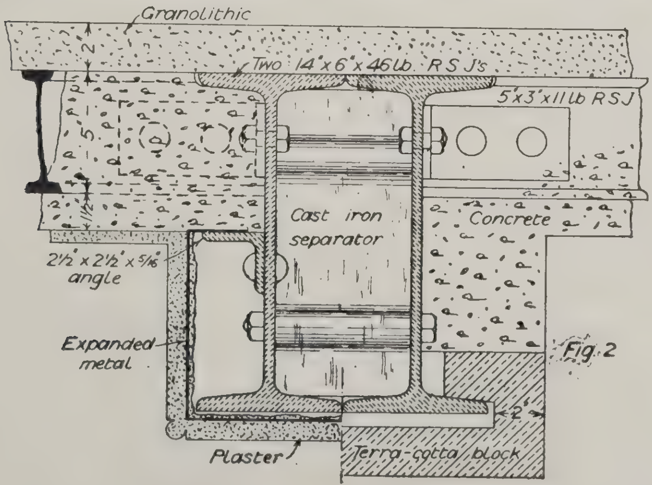
Wood Floor Covered with Cement.

HARROGATE.—A. I. writes: "What is a simple method of testing the stability and weight-bearing capacity of an old wood floor. This, the first floor, is covered with a thin layer of cement about 2ins. or 3ins. thick. Will this have the effect of rotting or destroying the timbers in any way?"

It is not a good plan to cover wood floors with cement, as the free access of the air being prevented they are very apt to rot, the same as when covered with linoleum or oilcloth. The parts likely to go first are the corners of the room. It is rather difficult to ascertain the condition of the floor without removing some of the cement or some of the lath and plaster from the ceiling below. A rough test may be made by measuring the deflection of the ceiling from the floor below when a load of 5cwts. is placed in the centre, and trying the deflection of a similar size floor without cement on it.

HENRY ADAMS.





FIRE-RESISTING FLOOR FOR STABLE.

Buildings near Banbury.

LONDON, S.E. — W. M. T. writes: "What are places best worth sketching within easy access of Banbury?"

At Banbury there are several old houses dating from 1570 to 1648. Two and a half miles south-west of Banbury is Broughton Castle, which is one of the most interesting houses in Oxfordshire, both as regards its history and its architecture. Its first appearance is that of an Elizabethan mansion, but a considerable portion dates from 1301 to 1307, inclusive of the hall, from which bays were thrown out in 1554, when Tudor windows were inserted instead of Gothic. The old battlements and lower part of the gatehouse and stables along the north side of the moat date from 1406, when permission to crenellate was granted by Henry IV. The castle contains many fine pictures and other art objects of great interest. One mile west is Tadmarton, with a small Decorated church, which has a lofty tower and sanctus-bell turret. Swalcliffe one mile west of Tadmarton has a fine church with Decorated exterior, and with Norman nave and Perpendicular tower. There is a good open tower roof, and the chancel screen retains much of its original painting and gilding. Three miles north-west of Banbury is Wroxton, containing an Augustinian priory and a Decorated church. A fine Transitional-Norman and Early English church is to be found at Alkerton. Between Banbury and Wroxton are the remains of Hanwell Castle, built in 1513, and an Early English Decorated church. Horley Church is of the Decorated period, but contain a beautiful Early English piscina, and Hornton Church in Transitional-Norman and Early English. Three miles north of Banbury is the village of Bowton Magna, which contains a desecrated church, now used partly as a dwelling house and partly as a school. It is Early Decorated in style, and retains its original roof. The east window contains good tracery. The piscina and locker remain in their original positions, and there is a beautiful Decorated window in the north wall.

H. Y. M.

Developing an Estate.

TAUNTON.—"ENQUIRER" writes: "A client is the owner of the property A, which abuts on, and is some feet higher than, the road, and is fenced in by a stone retaining wall. The width of the road from the base of the retaining wall to the other side is 26ft. 2in. There is a path on the opposite side of road, but none against the aforesaid retaining wall. We wish to develop our client's land as a building estate, but the Council will only pass the plans on the consideration that we make allowance for a 36ft. road. Can we be compelled to give up this land without receiving compensation ?"

If your client is laying out a *new* street he must take care that the total width is not less than 36ft. (carriage and footways together), but a sanitary authority has no power to call for the compulsory widening of an old roadway without compensation. I imagine that your client merely wishes to build upon land which has its frontage to an existing highway, and I therefore am of opinion the Council are not legally justified in asking him to sacrifice land for road widening. I advise you to ask under what by-laws or by what statutory powers they claim such a right. F.S.I.

EGYPTIAN ARCHITECTURE.

In the Anthropological Section of the British Association at York, last week, Professor W. M. Flinders Petrie delivered an address on the Hyksos and the work of the British School of Archæology in Egypt. The work of this British School during the past winter in Egypt had produced historical results as enlightening as any of recent years. For the first time they had been brought face to face with the Hyksos, or Shepherd Kings, in their own work. The city of Ramases, which the Israelites built, along with Pithom, had been made to tell its long history, and the town and temple of the High Priest Onias had been at last brought tangibly before them. The history and nature of the Hyksos conquest had long been debated. To the later Egyptians it was a mystery how such barbarians should have overrun their land; while to the modern students these people had been the subjects of many theories.

Professor Petrie described the great camp he had found at Tell el Yehudiyeh, twenty miles to the north of Cairo. It was certainly older than the 18th dynasty, and as certainly embanked by barbarian invaders, and with many graves inside and outside, all of Hyksos age, 2500 B.C. The camp was about 1,500ft. across; the bank was about 200ft. thick at the base, and was faced outside with a great slope of white stucco, 70ft. or 80ft. long, at an angle of about 40 degrees. But the makers knew nothing of brickwork, or even timber construction, and a gateway did not enter into their defensive system. Their only way into the camp was by a sloping road over 200ft. long, which rose up to the top of the bank. No such fortification was known before in Egypt. Within a year or two these defenders borrowed the walling from the Egyptians, and threw out flanking walls to defend the sloping entrance gangway and roadway more completely. Two or three generations later, when the stucco face was decayed, an entirely different system was adopted. They finally gave up the long slopes and archery defence, and made the skilled masons of Egypt build a great stone wall, with about 80,000 tons of the finest limestone, in large blocks from the Mokattam Hills, 25 miles distant. This wall was 45ft. high, 6ft. thick, and over a mile long; it was built outside of the bank, which thus ceased to have any slope and became a walled city. This probably was the celebrated Hyksos capital of Avaris.

The Hyksos Kings appeared to have been Semites, who came from the region between Syria and Mesopotamia, and pushed forward into Egypt and Cyprus.

Notes on Competitions

Lydney Cottage Hospital.

Premiums of £5 and £2 for designers placed first and second respectively, are offered by Lydney, in Gloucestershire, in a competition for a Cottage Hospital which is to cost £1,000. An additional £20 will be paid to the successful competitor *in the event of the building being erected from his plans.* "This is to include the said plans with full and adequate working drawings and specification. The said drawings and specifications to become the property of the Building Committee." This is most interesting. The only solid chances are the premiums, for the payment of the additional £20 to the successful competitor is dependent upon the caprice of the Building Committee, who, no doubt, will constitute themselves the sole judges of the fitness of the design for execution, which execution, it is evident, they intend to perform themselves. As may be assumed from conditions of this sort there is to be no professional assessor. It is lamentable that Lydney could not have found other means of having this trifling work carried out than by competition. Surely there are competent architects in Gloucestershire who would not consider a work of this size too small for acceptance.

The New County Hall, London.

Time does not dispel the unfavourable impression which has been caused by the decision of the London County Council to make the competition for its new premises an international affair, for each day brings its quota of opinion, expressed through media either personal or public, and mostly condemnatory. The subject is one which concerns Londoners in particular. To all who love the great city in which they work, and who bear their share of the cost of administration, the news must have come as a shock that the prize which they alone should have wrestled for is now to be the object of contest, not of the whole country, but of the whole world. No city has a greater number of architects qualified and competent to be entrusted with a work of this nature than has London. Nobody has better opportunities of studying the requirements of the plan than has a Londoner. No architectural treatment is more fitting than one that shall bear the stamp of local tradition. No one is more worthy to have a hand in this great work than he who has contributed, in whatever modicum, through the county rate, towards its cost. A County Hall is a particularly local institution. In a smaller town or city than London a competition is rendered advisable in inverse ratio to the number of competent architects practising in the vicinity. In spite of this there is a growing tendency to limit competitions to their own districts, as is evident to all who have studied recent invitations to architects to compete. There are some who may consider this idea of the reservation of London's Hall for London architects a narrow one. Assuming there to be arguments in favour of an extension of the field of limitation, surely there are few who would desire to see that limit extended beyond the shores of the British Isles. It has been argued that none but a Londoner or inhabitant of these islands would stand a ghost of a chance of success. If that be so, is it reasonable or fair to extend the limit beyond the sea line ? If the assessors perform their task conscientiously, and no one for a moment would suggest that they will not, there is the possibility of a foreign design being selected. The thought of London's Hall being carried out by anybody but a Britisher is appalling. Who is responsible for this state of affairs ? Two theories have been put forward: one, that the R.I.B.A. has had something to do with the matter, having been moved to generosity as a result of the Seventh International Congress of Architects; the other, that the superintending architect of the County Council, finding that the work was not to be his, advised that the field of competition should be as wide as possible. The first of these theories is obviously untenable, for the doings of the Institute are easily ascertainable; the second is improbable or should be regarded as such in the lack of evidence to the contrary. There seems little room for doubt that the County Council, upon the recommendation of its Establishment Committee, has acted upon its own initiative. It is a matter for regret that Sir Thomas Brooke-Hitching's voice was raised in vain when he championed the cause of British architects and instanced the many fine works they have produced.

List of Competitions Open.

DATE OF DELIVERY	COMPETITION.
—	PREMISES FOR LEVEN REFORM CO-OPERATIVE SOCIETY, LTD. Particulars from D. C. Wilson, sec., on Wednesdays and Saturdays.
—	MODEL VILLAGE at Brodsworth, near Doncaster, consisting of 500 cottages, club house, and shops. Design of cottages to be submitted with plan of model village, which will cover about 70 acres. Particulars from the Brodsworth Main Colliery Co., Ltd., Duckmanton, near Chesterfield.
Aug. 18	CHURCH EXTENSION, MAESTEG, Particulars from T. Rees, secretary Bethania Chapel, Maesteg, Mon.
Aug. 21	CEMETERY AND CARETAKER'S HOUSE, STEWARTON. Particulars from James Kerr, clerk to Parish Council, Stewarton, R.S.O., Aryshire.
Sept. 20	SCHOOL AT SUNDERLAND. Limited, to local architects. Premiums of £50, £20 and £10. Particulars from John W. Moncur, borough engineer, Town Hall, Sunderland.
Sept. 21	CONVALESCENT & NURSES' HOME AT GLOSSOP. Premiums of £20 & £10. Particulars from Mr. T. W. Ellison, Town Clerk, Norfolk Chambers, Glossop.
Sept. 28	SEWAGE DISPOSAL SCHEME FOR ELLESMERE. Premium of £20. Particulars from R. E. Lloyd, Clerk to Urban District Council, Ellesmere.
Sept. 29	REBUILDING OF HENSHAW'S BLIND ASYLUM AT MANCHESTER. Limited to Manchester architects. Premiums £100, £50, and £25. Assessor, Mr. John Holden, F.R.I.B.A.
Oct. 1	ALPHABET COMPETITION. Prizes of £20, £10 and £5. For particulars see "Architectural Review."

Our Plates

The house at Tadworth is built of brick, which is covered with rough cast. The roof is tiled with a dark red tile. The whole of the external wood-work is painted with green solignum and the internal woodwork with brown, except the living and dining rooms, which will be panelled in oak to the height of the doors, with a plaster frieze above in colour. Mr. J. J. Pink, of South Merstham, is the builder.

The house in Yorkshire will be built of local stone up to the string courses, and above the walls will be treated with rough cast and half timbering, the angles of the building being carried up in stone as pilasters. Westmoreland green slates will be used for the roof covering. The whole of the external wood-work will be of oak.

The architect of both houses is Mr. J. Percy Hall, A.R.I.B.A., of 6, Victoria Grove, Kensington, W.

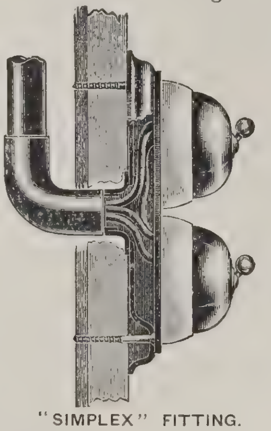
Electrical Notes.

Lifts.

Messrs. R. Waygood & Co., Ltd., of Falmouth Road, S.E., have recently published several pamphlets which it would be to the advantage of architects and others who have occasion to use lifts to study. This firm is noted for making both electric and hydraulic as well as hand-power lifts, and consequently they may be considered unbiased as to their relative merits, and to realise the possibilities of every variety of lift. They have no reason to advocate an expensive or inefficient lift of one kind because they specialise therein. One pamphlet embodies a contribution to the discussion as to the relative merits of electric and hydraulic power in the working of lifts and cranes. We notice particularly that the firm is paying special attention to the design of their lifts and lift enclosures. The cars are constructed of mahogany, teak, oak and other woods, and those of open ornamental ironwork are superior to the design we have unfortunately long been accustomed to. Another small pamphlet giving a list of the lifts for motor-cars, that have been constructed by Messrs. Waygood & Co. will be handy for those who wish to inspect such lifts, which are now becoming an important item for consideration in view of the increasing importance of the motor-car industry. Still another pamphlet deals with lifts or elevators on inclined rails, which form a feature of many of our sea-side towns for the conveyance of passengers up to the top of cliffs. This pamphlet has special reference to the two cliff lifts at Bournemouth, and to lift work generally in that town.

Conduits.

Messrs. Simplex Conduits, Ltd., have just issued a leaflet (No. 161) which deals with their new "Simplex" flush mounting boxes (patented). These are quite a novel departure in methods of mounting switches and other forms of electric lighting fixtures, and, as they are intended for concealed work, special attention has been paid in their design to reducing the depth dimension, thus minimising the channelling out of brickwork during erection. It will be found that to use these fittings in conjunction with a "Simplex" short-arm bend or tee gives the least possible depth dimension. They are finished in polished and lacquered brass, and the fact that they consist of a box in which slack wire may be coiled away and an artistic base on which the fitting may be mounted is a unique combination. We give a sectional view of the fitting herewith. In addition to the advantages enumerated above, the following claims are made:—(1) Wires totally enclosed in metal from beginning to end. (2) No plaster required to finish of walls. (3) Wireman cannot put fixing screws through circuit wires during erection. (4) Perfect insulation for switches, &c. (5) Neatest, strongest and most artistic method of mounting any form of electric light fixture.



"SIMPLEX" FITTING.

Bankruptcies.

Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver Adj.—adjudication.

DURING THE WEEK ending August 10th, thirteen failures in the building and timber trades in England and Wales weie gazetted.

R. & G. BRISLEY, builder and contractor, Dover. P.E., Guildhall, Canterbury, August 30, at 10.

J. W. BROOKS, plasterer and decorator, Eccles and Patricroft. P.E., Salford C.C., September 11, at 10.30.

E. TURNER, painter and decorator, Blackburn. P.E., Blackburn C.C., September 5, at 10.30.

COAD BROTHERS, builders, Finchley. P.E., Town Hall, Barnet, August 16, at 11.

MOIR & Co., timber merchants, Broxbourne. Adj., August 1.

C. FAIRBANK, builder, Birmingham. P.E., Birmingham C.C., August 27, at 2.

D. J. JONES, painter and decorator, Aberystwyth. First meeting, Town Hall, Aberystwyth, August 31, at 12.45 p.m. P.E., ditto at 12.30. Adj., August 1.

M. JENKINS, contractor, Port Talbot. Liabilities, £944; deficiency, £842.

BURGESS BROTHERS, builders, Westbury. Liabilities, £2,767; deficiency, £2,283.

J. W. HAWKINS, builder and auctioneer, London. Unsecured liabilities, £1,193; assets, £27.

C. W. CAMPION, plumber, Chelmsford. Liabilities, £2,696; assets, £666; deficiency, £2,029.

S. BOOTH, builders' merchant, Stockton Heath. Gross liabilities, £2,750.

J. SALTER, bricklayer, Attercliffe, late Wincobank. Liabilities, £224.

D. C. OAKLANDS, builder and haulier, Llantarnam Gross liabilities, £1,150; deficiency, £275.

"RALPH POWNALL," builders and timber merchants Heywood. Gross liabilities, £11,634; assets, £5,122.

Coming Events.

Monday to Saturday. August 13–18.

ARCHITECTURAL ASSOCIATION.—Annual Excursion.

Saturday, August 18.

NORTHERN ARCHITECTURAL ASSOCIATION.—Visit to the Medical College and New Grammar School, Newcastle-on-Tyne.

EVERYTHING ELECTRICAL
IS RELIABLE WHEN
SUPPLIED BY THE
EDISON & SWAN
United Electric Light Co., Ltd.
36, 37, QUEEN STREET, CHEAPSIDE.

EDISWAN
BELLS, INDICATORS, FANS, WIRES, SWITCHES, TELEPHONES, FITTINGS, BATTERIES, DISTRIBUTION BOARDS, ARC LAMPS, CEILING ROSES, SHADES, ETC., ARE, LIKE THE
"ROYAL EDISWAN" LAMP, BEST AND CHEAPEST IN THE END.

"All who have stocked cheap makes of Electric Lamps are well aware that constant complaints are made by users on account of their utter unreliabilty, and consequently the great majority of hardwaremen stock only the 'Royal Ediswan' Lamp, everywhere acknowledged to be the best and cheapest in the end. It is interesting to note that this lamp, made by the original patentees of incandescent lamps, has held the premier position for a great number of years, and that such is its repute that the Edison and Swan Co. are, by Royal Appointment, Lamp Makers to H.M. the King and H.R.H. the Prince of Wales.

"But it is not only cheap lamps that are a fertile cause of complaint, for we imagine that an electric bell that will not ring, or a telephone that refuses to act, is more annoying than a lamp that fails or blackens in a few days. . . . We are struck with the fact that there is only a matter of a few pence between the prices of the thoroughly reliable supplies listed (in the Ediswan Catalogue), and the showy but trumpery articles that are often offered as a cutting line. The recommendation of a satisfied customer is worth more than a very slightly increased profit, and one may feel perfect confidence in handling goods backed by so substantial a name as the Edison and Swan Co."

"Hardware Trades Journal."

July 27th, 1906.

Obituary.

Mr. Richard Grose, builder and undertaker, of Bodmin, died recently at the age of 72 years. Apart from his ordinary business he worked a quarry for building stone.

Mr. William Frederick Loxley, builder, of Oxford, died recently at the age of 52 years. A native of Shipston-on-Stour, he went to Oxford over 30 years ago, and for some years he had been a partner in the firm of Benfield & Loxley, builders, 106, Bullingdon Road. Among the many important contracts with which the deceased was associated may be mentioned the extension of the County Asylum at Littlemore, New College and St. John's College restoration, Magdalen School, and Lloyd's Bank Buildings.

Notes and News

A Disinfecting Station at Kensington has been erected at Wood Lane at a cost of about £7,000 from the designs of Mr William Weaver, former Borough engineer. The building contractors were Messrs. Hudson & Co., of Westminster, and the contractors for machinery &c., Messrs. Manlove, Alliott & Co., Ltd., of Nottingham.

A Correction.—Certain errors occurred in the answers to R.I.B.A. Exam. Questions in our last issue. On column 1 of page 69, in the answer to question 1 (b), for "area of bending" read "area of bearing." In column 1, page 70, in the answer to question 7, for $\frac{20 \times 20 \times 8 \times 62{\cdot}5}{112 \times 26}$ read $\frac{20 \times 20 \times 8 \times 62{\cdot}5}{112 \times 20}$. In the same column just below the above, for "each will carry half" read "each will carry $\frac{1}{9}$th of," &c. In column 3 of the same page, in reply to question 1 (3), for "portico" read "purlin."

Dangers of Building.—A departmental committee has been appointed by the Home Secretary to inquire into the dangers attendant on building operations, and to recommend regulations for safeguarding workmen. The members of the committee are Mr. William Dawkins Cramp, I.S.O., Deputy Chief Inspector of Factories (chairman), Mr. John Batchelor (Operative Bricklayers' Society), Mr. E. T. Jessup (Amalgamated Society of Carpenters and Joiners), Mr. William Shepherd (London Master Builders' Association) and Mr. Alexander H. Stenning (Surveyors' Institution). Mr. Leonard Ward, of the Home Office, will be secretary to the committee.

Glasgow Dean of Guild Court.—Mr. Thomas Mason, of Craigie Hall, Bellahouston, has been nominated for election as Lord Dean of Guild for Glasgow in the ensuing year. The election will take place in October. Along with Mr. John Morrison, Mr. Mason established in 1876 the firm of Messrs. Morrison & Mason, builders and contractors, who soon acquired a high reputation in England as well as throughout Scotland. Among the more prominent of the undertakings with which they have been entrusted may be mentioned the Glasgow Municipal Buildings, the canal line of the Glasgow and South-Western Railway, the Cathcart Railway, the new Glasgow Bridge, the tunnels and reservoirs at Craigmaddie in connection with the Glasgow water supply scheme, and the Thirlmere water supply scheme for Manchester.

Trade and Craft.

Bathrooms.

"Modern Bathrooms" is the title of a booklet illustrating a great variety of the famous "Standard" porcelain enamelled baths and one-piece lavatories, and containing useful advice with regard to planning and fitting a bathroom. A copy of "Modern Bathrooms" will be sent gratis and post free to architects, builders, or anyone interested in residence construction or refitting. "Standard" porcelain enamelled goods are so thoroughly reliable in material and in service, so artistic in finish and design—and withal so moderate in price—that their merits are worthy of consideration. Application for a copy of the booklet should be made to the Standard Sanitary Mfg. Co., Dept. G., 22, Holborn Viaduct, London, E.C., and ask for Booklet No. 7.

Waring's Annual Meeting.

At the ninth annual meeting of the shareholders in Waring & Gillow, Ltd., on August 2nd Mr. S. J. Waring, Junr., the chairman, said that 1905 was the best year which the company had yet had, not only as regards the volume of business done, but also as regards the profits earned, which were some £30,000 in excess of the preceding year. During the nine years of the company's existence there had been a continuous and unbroken record of increasing profits, in addition to their own reserve, which now amounted to £145,000. They were also building up ample reserves in Messrs. Hampton's, the Waring-White, and other subsidiary companies. Respecting the Waring-White Building Company, in which the company held a half interest, he thought it would be generally admitted, as proved by the actual results, that it was undoubtedly the most scientific and economical building organisation in Great Britain, and had met with a degree of success which was almost phenomenal. They had always been hampered in the past by the want of space in London, and a consequent lack of concentration, owing to the scattered position of their premises. This had now been rectified, and a building had been called into existence which was without parallel for its position, and the perfection of its goods, and the organization for conducting the business which it proposes to carry out. The question had been raised, would this new departure pay? Until now this had, of course, been a problematical point, but now they were in an assured position. They were able to tell, from the experience of the past several weeks in the new premises, that not only was success attained, but he might go further and say that the expansion in the general trade was already four times greater in volume than they had calculated would be sufficient to meet the increase in expenses. And this was not merely a spasmodic leap at the outset, but a gradual and steady weekly increase of business which set in from the opening week for sales. It had been charged against them as a fault that they had introduced American methods in building construction. From the commercial standpoint, however, the successful results and the large volume of business they had secured were a good answer; but he would go further and say that, from the most patriotic and higher national standpoint, it was imperative in these days of keen international competition to fit themselves for the great commercial race by adopting every useful method, be it American or German or Japanese, and by striving with every nerve to attain the greatest efficiency in order that they could retain their supremacy.

Colouring Concrete.

The natural grey colour of concrete does not generally meet with favour, and we all know of the efforts which are made to render it more pleasing by the incorporation of pigments with the cement and aggregate in the mixing. Now that concrete is coming into such increased favour for architectural purposes, the colouring of Portland cement concrete is likely to be increasingly in vogue. Of course it is possible to apply any colour in the way of distemper or paint after a job is completed, but for external purposes this is not lasting, and a building consequently becomes expensive in upkeep. The incorporation of pigments in the concrete in manufacture has not always been successful. It has often been overdone, the colours being too virulent, and the work becomes streaky and discoloured from the effects of rain and soot, while the colours often fade or discolour after a short period. The first two difficulties are overcome by the exercise of just a little commonsense and care, and are not traceable to inherent defects in the pigment. The last trouble, however, is caused by using an unsuitable pigment. There is lime in Portland cement which we all know destroys or seriously affects the colour of many pigments; others do not weather well. Of course, it is obviously foolish to expect a vegetable pigment to be of any service; if not destroyed by the cement, it will quickly lose its colour in the open air. The chemical action of the cement in setting is one which will affect all pigments except those which are inert, basic or alkaline. The oxides or iron are, on the whole, cheapest and most preferable. They should be obtained from a reliable manufacturer. Abroad, especially in Germany, Belgium and Scandinavia, artificial stone in various colours is largely manufactured, and also Dutch tiles and glazed roofing tiles are made with Portland cement coloured. In Italy, of course, the practice of colouring cement concrete has been practised for centuries. The importance of the industry abroad has led manufacturers to lay themselves out specially to manufacture colours suitable for the purpose. Such colours have been made for more than 100 years by the colour works of S. H. Cohn, of Berlin, who have recently opened a branch in England, at 27 and 28, King William Street, London, E.C. The advantages thus afforded manufacturers, architects, contractors and others of obtaining colours suitable for admixture with cements or lime will, no doubt, be appreciated.

Ruberoid.—Messrs. Robert W. Blackwell & Co., Ltd., have disposed of the departments of their business for the sale of Ruberoid roofing, dampcourses, "P. & B." building and insulating papers, and "Giant" building and damp-proof papers, to Messrs. the Ruberoid Co., Ltd., of Waterloo House, 81-83, Knightrider Street, London, E.C. Mr. Edgar R. James, late joint managing director of Messrs. Blackwell & Co., is managing director of the Ruberoid Co.

Complete List of Contracts Open.

WITH a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

August 16. Dalton-le-Dale.—*Restoration of the Parish Church of Dalton-le-Dale*, near Sunderland. Intending contractors may inspect the plans and specification on application at "The Glebe House, Dalton-le-Dale," up to August 16, when tenders are to be sent to C. H. The work will be divided into three sections, which must be tendered for separately. Fair wages clause. Tenders, marked "Painting," must be sent to A. E. Booker, clerk to the Guardians, Union Offices, Westbar, Sheffield, before 12 o'clock noon on August 22.

August 23. London, S.E.—*Cleaning, painting, colouring, and general repairs to the Relief Office and Dispensary, Royal Hill, Greenwich*, for the Guardians of the Greenwich Union. Copy of the specification will be furnished upon application to Louis Jacob, A.R.I.B.A., architect and surveyor, Globe Chambers. 493 New Cross Road, and payment of £1 deposit. Tenders to be sealed and endorsed "Tender for Painting, &c., Relief Office," directed to S. Saw and delivered at the Guardians' Offices, Greenwich Union, S.E., before August 23, on which day the same will be opened at a meeting of the Guardians.

August 25. Berwick-on-Tweed.—*Painting Certain farm buildings on the Corporation Estate.* For particulars apply to W. J. Bolam, Land Steward's Office, 42, Hide Hill, Berwick-on-Tweed, with whom tenders (to be sealed and marked "Tender for Painting") must be lodged on or before August 25.

ROADS AND CARTAGE.

August 16. Chelmsford.—*Steam rolling about 2,500 cub. yds. of road metal*—the work to be tendered for by contract, for the Rural District Council. Specification and quantities may be obtained from F. E. H. Powell, surveyor of highways, Avenue Chambers, Market Road, Chelmsford. Tenders, marked "Steam Rolling," must reach him on or before August 16.

August 17. Gillingham.—*Laying about 400 yards superficial of tar material footway and re-building wall on South side of High Street*, Gillingham. Specifications, &c., may be seen at Police Station, Gillingham, and tenders to be sent to the County Surveyor, Wimborne, on or before August 17.

August 20. Gosport. — *Making-up certain private streets known as White's Slip, Queen's Road, and Avenue Road.* Specifications may be seen and further particulars, with forms of tender, obtained at the Surveyor's office. Fair wages clause. Tenders endorsed "Tender for Private Streets," to be delivered to E. T. Palmer, clerk to the Council, Gosport, not later than noon on August 20.

August 21. London, W.—*Making-up Twyford Avenue from Creffield Road to the Great Western Railway.* Plans and specifications can be seen, and bills of quantities obtained, at 57, High Street, Acton, during office hours. Tenders to be delivered at the Council Offices, 242, High Street, Acton, W., not later than 3 p.m. on August 21. Canvassing the members of the Council, either directly or indirectly, for orders or contracts under offer will be deemed to be a disqualification.

August 22. Watford.—*Making-up the following roads:*—Sussex Road, part III. (267yds. in length); Mildred Avenue (690yds. in length), for the Urban District Council. Plans, sections and specifications may be seen, and forms of tender obtained on application to D. Waterhouse, surveyor. Tenders, duly sealed and endorsed, "Tender for Private Street Works," to reach H. M. Turner, Clerk to the Council, 14, High Street, Watford, not later than 12 o'clock noon on August 22.

August 23. Harrogate.—*Private street works* required in back roads off York Road. The specification may be seen and quantities obtained of F. Bagshaw, borough engineer and surveyor. Tenders must be submitted not later than 9 a.m. on August 23.

August 25.—Bromley.—*Supply of field-picked flints, granite, and ragstone of approved quality, and for the carting of gravel* for the Bromley Rural District Council from the date of the execution of the contract to the 30th September, 1907, for the under-mentioned Parishes: Chelsfield, Cudham, Downe, Farnborough, Hayes, Keston, Knockholt, Mottingham, North Cray, Orpington, St. Mary Cray, St. Paul's Cray, West Wickham. Separate tenders must be made in respect of each item as separately numbered on the form of tender relating to each parish. Tenders to be delivered to E. Hazlehurst, clerk to the Council, Park House, Bromley, Kent, prepaid not later than 1 o'clock on August 25. Forms of tender may be obtained at the offices of the Council, and no other forms will be accepted.

August 25. Bedwellty.—*Construction of a new road* across the Landslip near New Tredegar, for the Urban District Council. Plans and specification may be seen and forms of tender obtained on application to J. H. Lewis, Assoc.M.Inst.C.E., Council's surveyor, Blackwood, Mon., upon payment of a fee of £1 1s. The surveyor will meet intending contractors on the site by appointment. The contractor whose tender is accepted will be required to enter into a contract and bond, with two sureties, for the due and faithful performance thereof, and to pay the cost of same, amounting to £3, to include the necessary stamp duties. Sealed tenders, endorsed "Tender for New Road," to be delivered to T. J. Thomas, clerk to the Council, Bargoed, Glams., on or before August 25.

No Date. Steyning.—*Hire of two 10-ton Steam Road Rollers.* Particulars and forms of tender can be obtained from F. Slaughter, Surveyor to the Council High Street, Steyning.

Sept. 1. Loughton.—*Supply of the following* for the Urban District Council: — Granite, 300 tons, broken to 1½in., delivered in quantities as desired, free at Loughton or Chigwell Lane Railway Stations (G.E.R.): Gravel—500 yards clean gravel, delivered at Loughton when and where required; Hoggin and Destructor Clinker, 50 yards of each, delivered to Loughton Station in 5-ton truck loads. The District Surveyor to the Council will supply all information required. Tenders, marked on the outside "Materials," must be delivered to J. H. Hayward, Council Offices, Loughton, Essex, not later than 12 o'clock noon on September 1.

Sept. 10. London, N.—*Sewering, levelling, paving, metalling, kerbing, channelling, and making good avenue mews, Briston Grove, and Warner Road* (1st section), Hornsey. Forms of tender, &c., and particulars can be obtained from E. J. Lovegrove, borough engineer and surveyor, Municipal Offices, Highgate, on any morning between 10 and 12 o'clock. Tenders must be on the prescribed form, and delivered, or sent by post (sealed and endorsed), so as to be received in the Town Clerk's Office, 99, Southwood Lane, Highgate, N., by 4 p.m., September 10. Quantities, duly completed, must accompany the tenders.

Sept. 10. Harpenden.—*Draining, levelling, paving, metalling, kerbing, channelling and making good Douglas Road, Harpenden*, for the Urban District Council. Plans, sections, specifications of works and materials, and general conditions may be seen between the hours of 9,30 and 10.30 a.m., and bills of quantities and forms of tender may be obtained on deposit of cheque for £1 1s. upon application to John H. Leverton, surveyor, the Public Hall, Harpenden. Sealed tenders, together with fully-priced quantities, endorsed "Tender for Private Street Works," to be delivered to C. S. Tuckey, clerk to the Council, High Street, Harpenden, before noon on Sept. 10.

Sept. 12. Kingston-upon-Thames.—*Supply of 1,250 tons of Quenast, Guernsey or other granite suitable for road making*, the whole of such granite to be broken so as to pass through a ring having a 1½in. internal diameter. The above size will be strictly enforced. Tenders to be on forms to be obtained of the Borough Surveyor, at the Municipal Offices, where samples must be left. Sealed tenders, endorsed, to be delivered to H. A. Winser, Town Clerk's Office, Kingston-upon-Thames, on or before September 12.

SANITARY.

August 16. Morley.—*Construction of concrete sewage tanks and filter beds*, &c., at Springfield Mills, Morley. The plans and specifications may be seen and bills of quantities obtained at our offices until August 16, on which day tenders are to be delivered to Kirk & Sons, architects and surveyors, Dewsbury (free of charge), before 3 o'clock p.m.

August 18. Portsoy.—*Opening and re-filling of about four miles of pipe track: supplying, laying and jointing fireclay and iron pipes, from 5 to 16 inches in diameter: building of manholes, flushing tanks and other relative works.* Drawings and specifications may be seen with, and schedules of quantities obtained from, J. Young, town clerk, Portsoy, or from David J. Reid, civil engineer, Inverness. Sealed offers, marked "Tender for Drainage Works," to be lodged with the Town Clerk not later than August 18.

August 21. Uppingham.—*Laying about 550 yards of 9in. glazed stoneware pipe sewer*, with junctions, manholes, and ventilating shafts, at Glaston, in the above district, for the Uppingham Rural District Council. Forms of specification, with plan and section, may be seen by appointment with F. R. Chapman, A.R.S.I., sanitary surveyor, Glaston Road, Uppingham. Tenders to be sent to Mr. Oakley, clerk, Uppingham, on or before August 21 next, for the Council's acceptance.

August 25. Stansted.—*Provision, laying, and jointing about 641 yards of 9-in. stoneware sewer and about 1,254 yards of 6-in., together with all all manholes and lampholes*, for the Rural District Council, in accordance with the plans, sections, and detailed drawings prepared by the Surveyor. Plans and specifications may be seen at the Central Hall, Stansted, Essex, and further particulars to be obtained from E. J. Watts, surveyor, Thorley, Bishop's Stortford. Sealed tenders, endorsed "Stansted Sewers," to be delivered to A. G. Gwynn, Central Offices, North Street, Bishop's Stortford, not later than 12 o'clock noon on August 25.

August 28. Morecambe. — *Construction of certain intended stoneware and cast-iron pipe sewers* in connection with the sewerage works of the town of Morecambe, for the Borough Town Council, together with manholes, ventilators, connections, and other works, the whole to be let in one contract. Drawings and specification may be seen at the offices of Beesley, Son & Nicholls, MM.Inst.C.E., engineers, of 11, Victoria Street, Westminster, S.W., where also specification, bills of quantities, and forms of tender can be obtained on deposit of £5. Copies of the plans and specification may also be seen at Town Hall, Morecambe. Sealed tenders, addressed to W. Tilly, and endorsed "Sewerage Works, Contract No. 3," are to be delivered at the Town Hall, Morecambe, before 10 a.m. on August 28.

September 6. Surbiton, Surrey.—*Construction of main drainage works* for the Urban District Council, subject to the sanction of the Local Government Board. The drawings, specifications, bills of quantities, and forms of tender, may be inspected at the offices of Nicholson-Lailey, M.Inst.C.E., engineer, 53, Victoria Street, Westminster, between 10 a.m. and 5 p.m. (Saturdays excepted), until September 3. Tenders, sealed and endorsed "Surbiton Main Drainage," are to be addressed to F. J. Bell, deputy clerk, Surbiton Urban District Council Offices, Ewell Road, Surbiton, and delivered on September 6 by 12 o'clock noon. A deposit of £10 Bank of England note will be required.

TIMBER.

August 21. London, N.—*Supply of 100 fathoms of best yellow Baltic deal and batten ends*, to be delivered at the Edmonton Workhouse, for the Guardians. The firewood to be not less than 18ins. in length and all square edge. Anything under 18ins., round-edged pieces, or inferior wood will be rejected. The accepted firewood will be stacked by the Guardians, and only the measurement acknowledged after it has been examined and stacked on the premises at the Workhouse, Upper Edmonton. Sealed tenders, endorsed "Tender for Firewood," upon forms to be obtained from F. Shelton, clerk, Lower Tottenham, much reach him on or before August 21.

MISCELLANEOUS.

Sept. 11. Newcastle-on-Tyne. — *Supply of rails, points, and crossings, together with the necessary fishplates, tie-rods, bolts, and nuts*, in connection with the renewal and extension of a double junction in Northumberland and Blackett Streets for the Tramways Committee of the Corporation. Alternative offers are asked for—(1st) in hardened cast steel points and crossings and rolled steel rails; (2nd) in manganese steel throughout. Plans may be seen, and specifications, schedule of quantities and form of tender obtained, at the office of the City Engineer, Town Hall, Newcastle-upon-Tyne, on payment of £1 1s. Tenders, endorsed "Tender for renewal, &c., of Northumberland Street junction," and addressed to the Chairman of Tramways Committee, to be delivered at the City Engineer's office, on or before September 11.

August 20. London, E.C.—*Supply and delivery of red and white lead*, as per specification to be seen at the company's offices, for the Bengal and North Western Railway Company. Tenders, addressed to A. Izat, 237, Gresham House, Old Broad Street, E.C., and marked "Tender for Red and White Lead," are to be lodged not later than noon on August 20. For each specification a fee of 10s. will be charged.

TOO LATE FOR CLASSIFICATION.

August 18. Dunfermline.—*Painting proposed to be done in connection with* the Dunfermline Combination Poorhouse. Copies of specification and particulars of the work may be obtained from the Governor. Sealed offers, marked outside "Painting Work," to be lodged with J. Delvin on or before August 18.

August 20. Knaresborough.—*Painter's work required at the Infirmary for Females* for the Board of Guardians. Specification of the work required to be done may be had on application to the Workhouse Master. Tenders to be sent to J. Smith, clerk, Poor Law Offices, Knaresborough, not later than August 20, endorsed "Tender for Painting."

August 25. Bangour.—*Painter work of four closed Homes* at Bangour Village Asylum. The relative schedules may be obtained on application to H. J. Blanc, R.S.A., architect, 25, Rutland Square, Edinburgh, where specification and general conditions of contract, &c., will be exhibited. The schedules shall be priced and extended, and lodged with J. Kyd, clerk and treasurer, District Lunacy Board Offices, Castle Terrace, Edinburgh, not later than August 25, at 10 a.m., along with the tender. In the event of the contractor deciding not to tender after receipt of the documents, these are required to be returned.

August 27. Hawthorn.—*Erection of a Mission Hall* at Hawthorn, Pontypridd, for the Trustees of the English Baptist Church. Plans and specification may be seen of A. LL. Thomas, A.M.I.M.E., architect and engineer, Church Street Chambers, Pontypridd. Tenders to be sent to the Rev. E. Lewis, 89 Wood Road, Pontypridd, by August 27.

August 27. Knotty Ash.—*Erection at Highfield Infirmary, Knotty Ash, of laundry buildings*, according to plans and specifications, to be seen at the office of E. Kirby and W. E. Willink, architects, 5, Cook Street, Liverpool, between the hours of 10 o'clock a.m. and 5 o'clock p.m. Bills of quantities, conditions of contract, and forms of tender (upon which alone offers will be received) may be obtained at 5, Cook Street, on payment of a deposit of £2. Sealed tenders must be delivered to H. J. Hagger, vestry clerk, Parish Offices, Brownlow Hill, not later than August 27.

August 28. Ashford.—*Supplying abont 640 superficial yards of Kentish ragstone paving* for the Maidstone Ashford Cattle Market. Plans and specifications may be seen at the offices of A. J. Burrows, F.S.I., surveyor, Bank Street, Ashford. Tenders to be sent to F. Hughes-Hallett, secretary, Ashford, not later than August 28.

August 28. Ashford.—*Supplying and erecting about 325 feet run tubular iron fencing with cast iron standards and supplying and laying about 220 feet 1¼in. galvanised water pipe with hydrant* for the Maidstone Ashford cattle market. Plans and specifications may be seen at the offices of A. J. Burrows, F.S.I., surveyor, Bank Street, Ashford. Tenders are to be sent to F. Hughes-Hallett, secretary, Ashford, not later than August 28.

August 28. Eastby, near Skipton.—*Erection of an entrance lodge* at the Sanatorium, Eastby, near Skipton. Contractors desirous of tendering for this work are requested to forward their applications not later than August 18, along with a deposit of £1 1s., to F. Holland, engineer and architect to the Board, 11, Parkinson's Chambers, Hustlergate, Bradford. Particulars will be forwarded in due course. Drawings and specifications may be seen at the architect's offices. Sealed tenders, on separate forms of tender supplied, to be endorsed "Eastby," to be sent to G. M. Crowther, clerk to the Guardians, 22, Manor Row, Bradford, not later than 10 a.m. on August 28.

August 31. Cadiz, Ohio.—*17,700 square yards more or less, of street paving with brick.* Sealed proposals will be received by the Clerk of the Village of Cadiz, Ohio, until 12 o'clock noon, August 31. Plans and specifications can be seen and forms of proposals obtained at the office of the Village Clerk, or the Engineers, The Riggs-Sherman Co., 613, Nasby Building, Toledo, Ohio.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, *Great New Street, Fetter Lane, E.C.*

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

The "DEVON" FIRE is made in sizes and designs to suit any room, and can easily be fixed to existing mantels.

The saving in coal will be fourd to quickly repay the cost of installation, to say nothing of increased comfort, better ventilation, and reduction in servants' work.

Supplied in a charming variety of the most artistic colours, in tiles, brick, or briquettes, and faience or antique glazed blocks.

EASILY FIXED TO EXISTING MANTELS.

Price from £2 upwards.

CANDY & Co., Ltd.,

are the Sole Manufacturers of the

"DEVON" FIRE.

ARTISTIC - INEXPENSIVE - EFFICIENT.

IMPORTANT TESTS OF OPEN DOMESTIC GRATES

carried out officially by The Smoke Abatement Society in conjunction with H.M. Office of Works, at the New Government Buildings in Parliament Street, London.

See Report in "Lancet," May 19th, 1906—

"As a final result of the whole of the tests, the examiners find that of the Grates submitted those of Messrs. Candy & Co., and two other firms, are the best, showing practically equal results. The amount of coal consumed by these grates was found to be moderate in comparative proportion with temperature obtained; the fires were bright and clear."

N.B.—Thirty-seven grates were tested, including nearly all the best known modern types.

Send for Illustrated Price Lists and full copy of Report of Tests.

CONCRETE AND STEEL SUPPLEMENT (MONTHLY).

THE DESIGN OF REINFORCED CONCRETE BRIDGES.

By Charles F. Marsh, M.I.C.E., A.M.I.M.E.

(Concluded from p. 33 No. 597).

For the Design of Bowstring Girders

of any considerable span, it would appear that the adoption of hooped concrete was almost a necessity, since the compression members can, by its employment, be reduced considerably in size. Fig. 5 shows the method of reinforcement adopted by M. Considère for a bridge of 65½ft. span, constructed for experimental purposes prior to the design of the Plougastel Bridge shown in Fig. 1.

FIG. 5.

The compression boom is of hooped concrete, while the tension members are reinforced in such a manner that the rods will take up the whole tensile stresses. The hooping shown in the tension boom is merely placed at the connections with the bracing to prevent any tendency to pulling the rods out of position. The connections of the rods in the bracing to the compression boom is secured by the adhesion of the metal and the concrete, but the strength is increased by forming each pair of

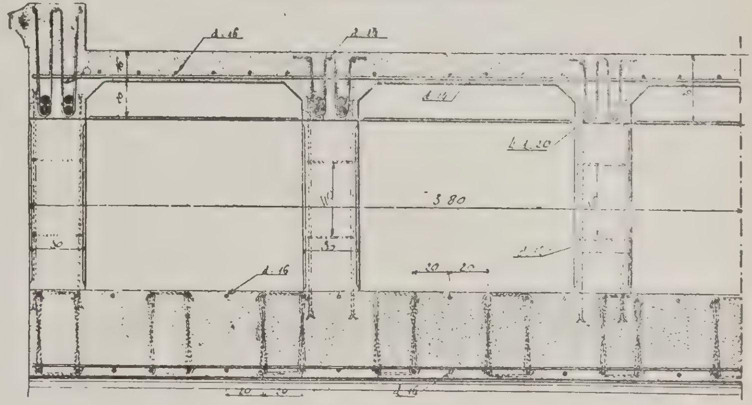
HALF TRANSVERSE SECTION.



reinforcements in one piece with a loop at the top. No allowance is made for the adhesion in the tension boom.

Bowstring girder bridges have also been designed of ordinary reinforced concrete, of which Fig. 6 is an example. The tension and compression booms of this bridge are reinforced with straight rods, round which are bent the vertical rods of the bracing. Short horizontal rods are placed between the longitudinal in the top boom, and the rods from the cross beams supporting the decking are continued between the longitudinal rods in the bottom boom to offer further hold to the bracing rods.

The bracing only consists of cross shaped verticals, but additional reinforcing rods are placed in the upper portion of the bottom boom and lower portion of the upper boom, and four of these are bent so as to form inclined bracings passing through the vertical posts.

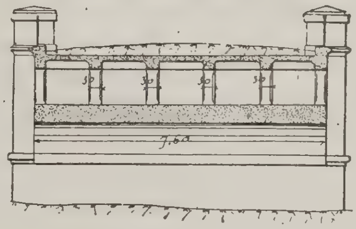
The decking is supported on cross beams from the lower boom, and rail bearing beams are inserted to carry a line of railway over the bridge.

The Design of Arch Bridges

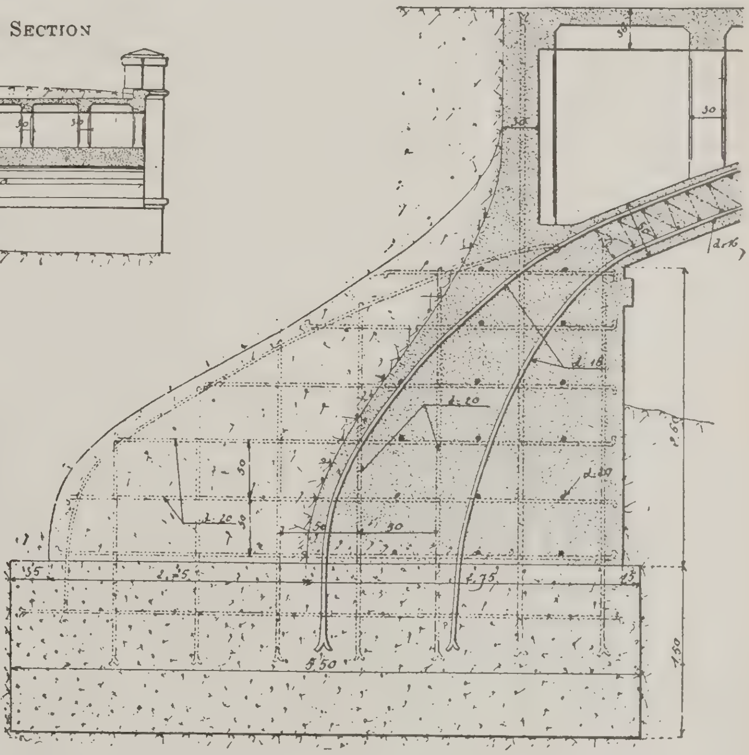
resolves itself practically into three main classes:—(1) Those formed with several ribs supporting the decking, either directly or with the aid of cross beams; (2) those formed as single arches without ribs and reinforced with bars of small sectional area; (3) those formed as single arches without ribs and reinforced with large sections.

All three classes may be designed with open spandrils of the arcade or colonnade type, but when this type is adopted, care should be taken to provide reinforcements to resist the shearing stresses at the junction of the spandril walls or columns with the arch. The third class perhaps lends itself most completely to the adoption of hinges, since they may be readily attached to the reinforcing sections. When the second class is erected with hinges they are usually formed by splaying back the concrete of the arch or specially worked stones inserted at the hinged joints and the insertion of lead fillets.

TRANSVERSE SECTION



DETAIL OF ABUTMENT.



The Continuous Arch

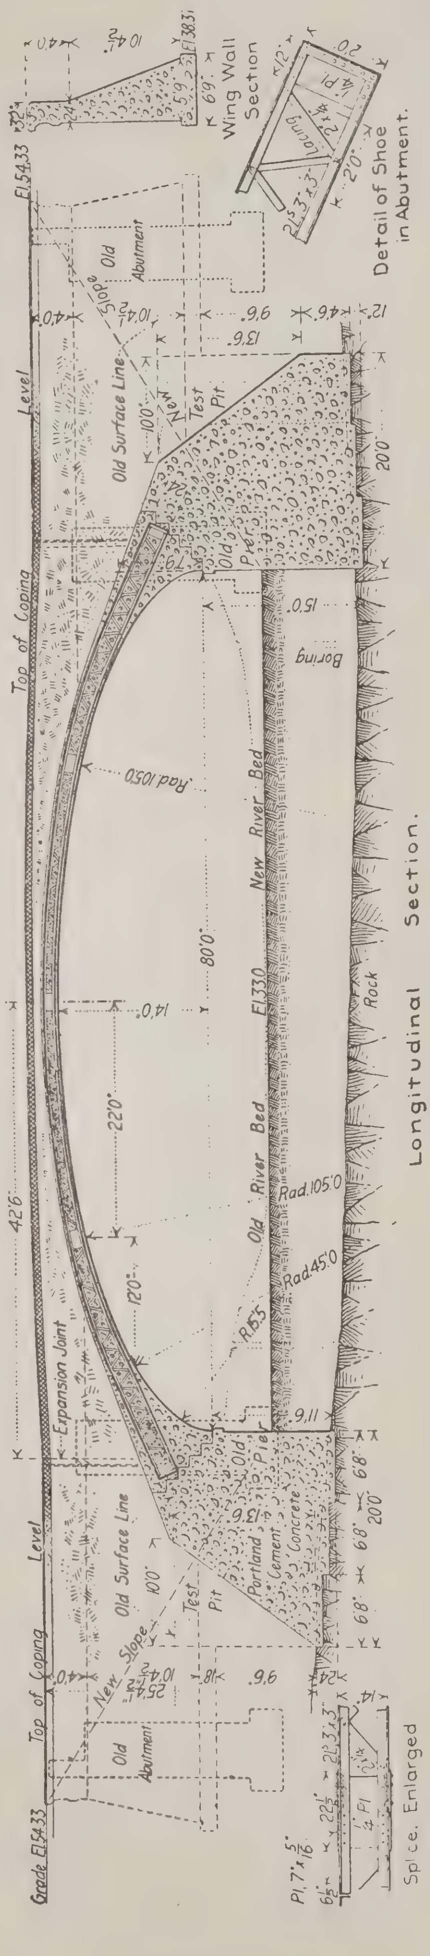
is the form most frequently adopted and, since the temperature stresses can be found when the arch is treated as being elastic, the employment of hinges is not so important for bridges of moderate span.

The first class is that most usually adopted by M. Hennebique for arches reinforced on his system. Fig. 7 shows a bridge of this class designed with seven ribs. One side of this bridge carried a road and the other a railway, consequently two ribs D were placed under the rails, while only one rib B was placed under the roadway. The outer B rib and rib C are under the sides of the roadway and the stringer beam F is placed under the outer edge of the central footway.

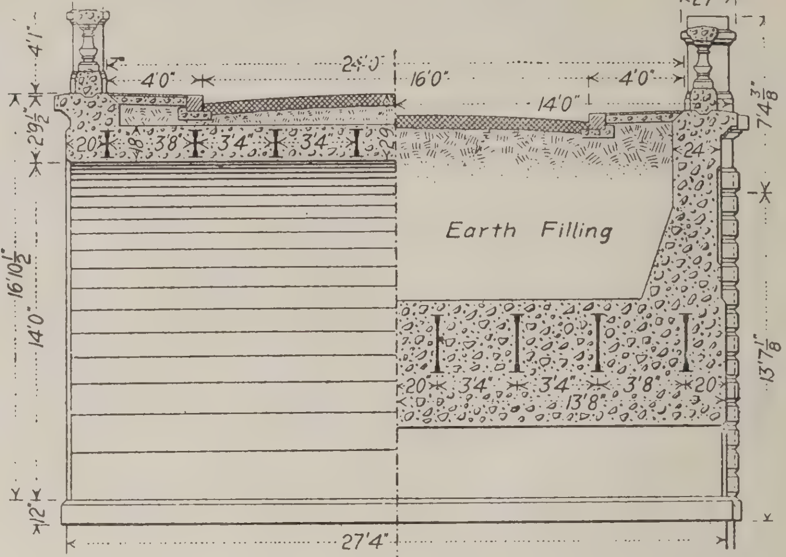
All the ribs, except those at the faces, are widened out towards the abutments, and are reinforced with three sets of rods, one following the intrados, one following the extrados at the springings and being bent down to follow the intrados at the crown; the remaining series occupy a mean position between the two others in the depth of the arch ring.

All the reinforcements are securely tied to the concrete by stirrups.

The decking is supported on cross beams reinforced with straight and bent-up rods, the decking itself being reinforced by horizontal rods in both directions. The piers are designed with reinforced face walls with the reinforcements securely tied into the filling of weaker concrete with stirrups.



Longitudinal Section.
FIG. 9 (Portion).



Half Section at Crown. | Half Section near Abutment

FIG. 9 (Portion).

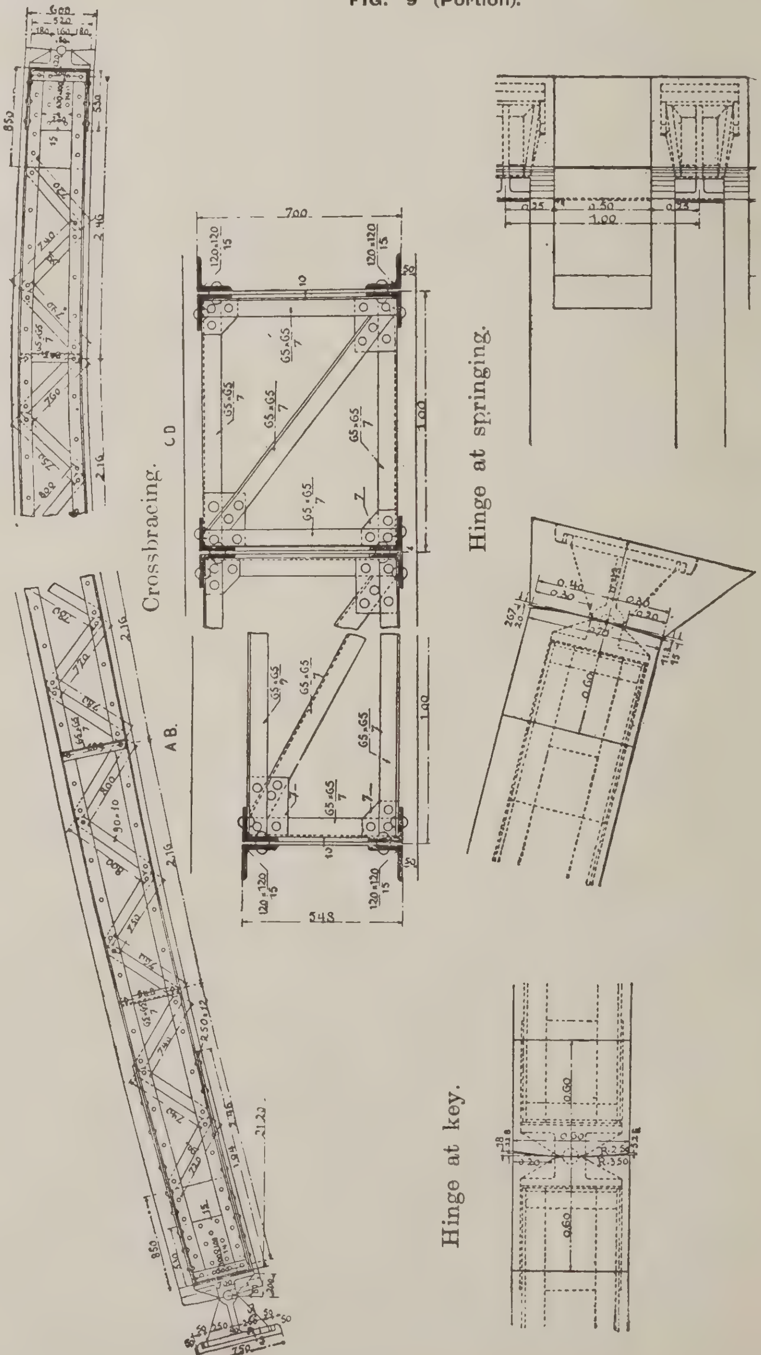


FIG. 10.

The abutments are formed with reinforced compartments, the ribs being continued right through, and additional division walls being inserted in the rear compartments. The arched ribs of this class of bridge are usually formed with a flat extrados, as shown in this illustration, but the extrados may be curved if thought desirable.

The second class of arched bridge is that most frequently adopted, and is the design employed by M. Monier for the first arches constructed of this material. Fig. 8 shows a bridge of this class with colonnade spandrils. The arch is reinforced with longitudinal rods near the intrados and extrados, and there is a further series of transverse rods near the intrados, the longitudinal rods near the extrados and intrados are securely tied together with wire ties. The longitudinal reinforcements are carried down to the foot of the abutments which are formed with counterforts.

The abutments are reinforced with vertical, longitudinal, and transverse rods, and the counterforts have vertical and transverse reinforcements.

The columns forming the spandrils are reinforced with four vertical rods, one at each corner, which are carried down well into the arch and tied together with wire ties. It would have improved the design if these rods had been bent out in the arch to resist shear.

The decking is supported by longitudinal and cross beams carried by the columns and reinforced along the bottom with four rods, which are tied to the concrete in the upper surface of the decking by wire stirrups, which are passed over small longitudinal rods at their upper ends. The decking is reinforced with longitudinal and transverse rods.

The third class, where heavy reinforcing sections are employed, is that adopted for the Melan and other similar systems.

Fig. 9 shows a bridge of this class.

The reinforcement consists of a series of built-up lattice girders, increasing in depth from the centre to the springings. The roadway is carried directly by the arch, and the abutments are formed solid without reinforcement. Fig. 10 gives the details of the reinforcements adopted for a three-hinged arch of this class, and indicates the adaptability of this type of reinforcement for hinged arches.

Although the Shearing Stresses are small in arched bridges, except locally, where open spandrils are employed, the longitudinal reinforcements should be well tied together, since the stresses are mainly compressive and the tying together of the reinforcements tends to prevent the swelling of the concrete.

It is well to provide expansion joints in continuous spandril walls of reinforced concrete arches, since the elastic deformation of the arch is liable to induce considerable stresses in the spandril walls, and may cause cracks if not provided for.

A Reinforced Concrete "Skyscraper."—The newest type of "skyscraper" is the concrete office building of eleven storeys near Herald Square, New York. The building will be erected in sections of two storeys each, with one-storey sections in certain places, so that each succeeding floor will fit into the one below. It is hoped to save from fourpence to fivepence a cubic foot as compared with steel-frame construction. The cost of the projected concrete "skyscraper" is estimated at about £400,000. The site is 126ft. by 99ft.

SHEAR STRESSES

In Beams of Steel and of Reinforced Concrete.

By Prof. Robert H. Smith,
A.M.I.C.E., M.I.M.E., M.I.E.E., &c.

(Concluded from p. 42, No. 597.)

The results of such calculations are very interesting, and are best appreciated when set out in diagram form. Fig. 3 gives the stress diagram for the reinforced concrete beam section taken above as illustration. The shear stresses are plotted to a scale five times more open than that used for the compressive and tensive stresses. The actual ratio between these two sets of stresses depends upon the ratio of the total shear force on the section to the bending moment to which it is subjected. In the compression-tension diagram the full line gives the normal stress upon the vertical section at each level, and it will be noted how it runs suddenly outwards in the steel part of the section. The dotted lines give the maximum tension and compression on oblique sections at each level, and it is useful to observe that these do not vary so rapidly as do the ordinarily calculated stresses on the vertical section. In fact, while from neutral axis to top surface the ordinary calculated compressive stress varies from uniformly to a maximum, the maximum compressive stress on oblique sections is at neutral axis still 80 per cent. of the value at the top, while there is also at neutral axis a maximum tension of the same amount. The maximum compressive stress really remains almost exactly constant throughout 40 per cent. of the total sectional depth. In the concrete just above this steel this maximum compression is still 50 per cent. of that at the top, while the maximum tension has an intensity of 90 per cent. of the top compression. Below this level the maximum compression is practically zero, and the maximum tension practically the same as that upon the vertical section.

Explanation of the Diagram.

In the shear stress diagram the lower full-line curve gives the shear stress on vertical and horizontal sections at each level, this being what is ordinarily calculated. The parabolic curve runs from zero at top to a maximum at neutral axis, and then decreases symmetrically from this axis to close upon the steel. Here it drops very rapidly through the depth of the steel, and finally runs to zero at the lower edge of the concrete.

The outer curve gives the maximum shears on oblique sections, the diagonally raffined area showing the excess of these over those on horizontal and vertical sections. This excess is zero at neutral axis, but at the top surface, where it is too often imagined that there is no shear, it is $\frac{5}{8}$ths of the value at the neutral axis, and the maximum shear remains almost constant at this through about 15 per cent. of the total sectional depth. Below the neutral axis it decreases symmetrically to just above the embedded steel. Here the maximum shear in the steel rises to rather more than five times the shear in the concrete immediately above it, and the maximum shear in the concrete below the steel is quite small, finishing at the bottom surface at a value, in this case, or half its value at the top surface.

It is hardly needful to point out that these maximum compressive, tensive and shear stresses are those on which the safety of the beam against breakage really depends. It follows that the material of a "full" rectangular section is a great deal more completely utilised than one would be led to suppose by consideration only of those stresses ordinarily calculated, namely, those on the vertical and horizontal sections.

Shear Stresses in Steel Beams.

The compressive and tensive strengths of steel are about equal. In rolled steel with ·1 per cent. carbon they vary from 50,000 to 60,000lbs. per sq. in., and with ·15 per cent. carbon from 60,000 to 70,000, while in steel castings they may be taken as varying from 60,000 to 90,000. The shear strength is somewhat less, and in a rather uncertain ratio. In these three materials it may be considered to average from 45,000 to 50,000, from 50,000 to 60,000, and from 50,000 to 70,000. The material is practically homogeneous in respect of its stress and strain qualities, although rolled mild steel bar has certainly some excess of tenacity in direction of rolling.

The stresses will be most readily understood from the calculation of one or two examples. We take two I beams of the same proportions except that one has a web of double the thickness of the other. We are chiefly interested in proportions and not in absolute sizes, and we therefore call the depth of section 100. The linear unit may be any, such as a millimetre, $\frac{1}{8}$th or $\frac{1}{10}$th or $\frac{1}{4}$ inch. It may be convenient to think of the sizes in $\frac{1}{10}$th inches. The numerical calculations are set out for a flange breadth of 60, and flange-edge thickness 10, tapering to 15 at the web. Immediately following the numerical calculations, they will be found repeated in general algebraic terms. The disadvantage of these latter is that to the eye they appear fearsomely complicated and difficult; but reference to their numerical analogues will show that this apparent excessive difficulty disappears so soon as special values are given to the letter symbols.

The ease and rapidity of such calculations depends very greatly upon the orderly method followed in carrying them out. The best method is to look on the section as made up of (1) a full rectangle of outside dimensions; (2) a negative rectangle of web-depth and of width equal to flange, minus web-width; and (3) four negative triangular areas under the bevels of the tapered flanges.

FIG. 5.

Referring first to Fig. 4 with web-thickness 20_e, and web-depth 70, the Sectional Area$=$A$= (60\times 100-40\times 70-4\times 5\times 10)u^2$
$=(6{,}000-2{,}800-200)u^2= 3{,}000u^2$,
where u is the linear unit in which sizes are measured. Of this the web-area is $20\times 70u^2=1{,}400u^2$.

The Moment of Inertia is

$$\mathrm{I}=\frac{u^4}{12}(60\times 100^3-40\times 70^3)-$$

$$4u^4\times 5\times 10\left\{\frac{5^2}{18}+\left(\frac{110}{3}\right)^2\right\}$$

$$=10^4u^4\left\{\frac{6{,}000-1{,}372}{12}+\frac{242{\cdot}25}{9}\right\}=$$

$10^4(385{\cdot}67-26{\cdot}92)\,u^4=10^4\times 358{\cdot}75u^4$. Of this the web contributes

$$\frac{u^4}{12}\times 20\times 70^3=10^4\times 57{\cdot}17u^4.$$

If $\mathrm{T_m}$ be the extreme fibre longitudinal tension and compression, the Bending Moment is

$$\mathrm{M}=\frac{\mathrm{I}}{50}\mathrm{T_m}=71{,}750u^3\mathrm{T_m}.$$

Therefore, if $\mathrm{T'_m}$ be the rate at which $\mathrm{T_m}$ varies longitudinally, and the section being taken as constant, the total shear form on the section is

$$\mathrm{F}=\mathrm{M}'=71{,}750u^3\mathrm{T'_m}$$

and the *average* shear stress over the whole section is

$$\mathrm{F/A}=\frac{71{,}750}{3{,}000}u\mathrm{T'_m}=23{\cdot}92u\mathrm{T'_m}.$$

Making now similar calculations for the section in Fig. 2, with web thickness 10, there is found,

$$\mathrm{A}=(6{,}000-3{,}500-250)\,u^2=2250\,u^2,$$

of which the web contributes $10\times 70u^2=700u^2$.

$$1=\frac{u^4}{12}\left(60\times 100^3-50\times 70^3\right)-$$

$$250\left\{\frac{5^2}{18}+\left(\frac{110}{3}\right)^2\right\}u^4$$

$$=10^4\,u^4\left\{\frac{6{,}000-1{,}715}{12}-\frac{302{\cdot}81}{9}\right\}=$$

$$10^4\times 323{\cdot}43u^4,$$

of which the web contributes $10^4\times 28{\cdot}58u^4$.

$$\mathrm{M}=\frac{\mathrm{I}}{50}\,\mathrm{T_m}=64{,}686u^3\mathrm{T_m},$$

$$\text{and }\mathrm{F/A}=\frac{64{,}686}{2{,}250}u\mathrm{T'_m}=28{\cdot}75u\mathrm{T'_m}.$$

If now the total sectional depth be called, for any sectional proportions, H, the flange width B, the web thickness W, the flange edge-thickness D and the flange thickness at web $(\mathrm{D}+d)$, then

$$\mathrm{A}=\mathrm{BH}-(\mathrm{B}-\mathrm{W})\ (\mathrm{H}-2\mathrm{D}-d)$$

$$\mathrm{I}=\tfrac{1}{12}\left\{\mathrm{BH}^3-(\mathrm{B}-\mathrm{W})\ (\mathrm{H}-2\mathrm{D}-2d)^3\right\}-$$

$$(\mathrm{B}-\mathrm{W})\,d\left\{\frac{d^2}{18}+\left(\frac{\mathrm{H}}{2}-\mathrm{D}-\frac{2d}{3}\right)^2\right\}.$$

This expression for I may be simplified algebraically, but the above numerical examples show that the form here given is really the simplest for calculation.

In the arithmetic calculation of I the factor $\left\{\frac{d^2}{18}+\left(\frac{\mathrm{H}}{2}-\mathrm{D}-\frac{2d}{3}\right)^2\right\}$ is conveniently taken in the form $\frac{1}{9}\left\{\frac{d^2}{2}+\left(1\tfrac{1}{2}\,\mathrm{H}-3\mathrm{D}-2d\right)^2\right\}$, and it will always be found that the term $\frac{d^2}{2}$ is negligibly small. It corresponds to the I of the small triangular areas about an axis through their own centres of area. In the above examples it is only about $\frac{1}{10000}$th of the whole, and, therefore, affects only the 5th significant figure in the result.

Then

$$\mathrm{M}=\frac{2\mathrm{I}}{\mathrm{H}}\ \mathrm{T_m}\text{ and }\mathrm{F/A}=\frac{2\mathrm{I}}{\mathrm{HA}}\ \mathrm{T'_m}$$

With regard to the value of F, if the beam be symmetrically supported at its two ends and have its load symmetrically distributed, the greatest F occurs close to either end and equals half the total load. It changes sign at the centre. With a single concentrated load it remains uniform throughout each half of the span, and with a uniformly distributed load decreases uniformly from the above maximum at either end to zero at the centre. It is always quite easy to find for every section throughout the span from the special mode of loading. Therefore the last equation is really useful inversely for calculating $\mathrm{T'_m}$ from F rather than for finding F/A from t'. This inverse form of it is

$$\mathrm{T'_m}=\frac{\mathrm{H}}{2\mathrm{I}}\ \mathrm{F}=\begin{cases}\dfrac{\mathrm{F}}{71{,}750u^3}\text{ in Fig 4.}\\[2ex]\dfrac{\mathrm{F}}{64{,}686u^3}\text{ in Fig 5.}\end{cases}$$

Although the average shear on vertical sections is easy to calculate, this is little guide to the maximum shear, which is the stress of real practical importance. At each level the shear depends on the total of the normal stress above or below that level, and, therefore, we must now calculate the distribution of this normal stress.

The normal stress at top or bottom surface being called $\mathrm{T_m}$, and varying uniformly from this to zero at neutral axis at mid-depth of the section, if this section were a full rectangular one the total normal force above or below neutral axis would be $60\times 50\times\frac{\mathrm{T_m}}{2}=\frac{\mathrm{BH\,T_m}}{4}$, and that on the part of the section of height h above neutral axis would be $60\times h\times\frac{h}{50}\,\frac{\mathrm{T_m}}{2}=\frac{\mathrm{B}}{}\,h^2\mathrm{T_m}$. The sectional breadth, however, being variable, allowance has to be made for this, remembering that, for each rectangular part, its contribution would be proportional to h^2 if it stretched down to the neutral axis.

Thus for both sections in Figs. 4 and 5 the normal force on the parallel part of one flange is

$$\frac{60}{2}\left(50-\frac{40^2}{50}\right)\mathrm{T_m}={\cdot}6(50^2-40^2)\mathrm{T_m}=540\mathrm{T_m}.$$

In general terms this is

$$\frac{\mathrm{B}}{2}\left\{\frac{\mathrm{H}}{2}-\frac{2}{\mathrm{H}}\left(\frac{\mathrm{H}}{2}-\mathrm{D}^2\right)\right\}\mathrm{T_m}=\mathrm{BD}\left(1-\frac{\mathrm{D}}{\mathrm{H}}\right)\mathrm{T_m}.$$

The amount on the half of the web on either side of the neutral axis is in Fig. 4

$$\frac{20}{2}\cdot\frac{35^2}{50}\mathrm{T_m}=\frac{1}{5}\times 35^2\mathrm{T_m}=245\mathrm{T_m}.$$

and in Fig. 5

$$\frac{10}{2}\cdot\frac{35^2}{50}\mathrm{T_m}=\frac{1}{10}\times 35^2\mathrm{T_m}=122{\cdot}5\mathrm{T_m},$$

the general formula being

$$\frac{\mathrm{W}}{2}\cdot\frac{2}{\mathrm{H}}\left(\frac{\mathrm{H}}{2}-\mathrm{D}-d\right)^2\mathrm{T_m}=\frac{\mathrm{W}}{\mathrm{H}}\left(\frac{\mathrm{H}}{2}-\mathrm{D}-d\right)^2\mathrm{T_m}.$$

On the tapered part of the flange, the

normal force is

$$\int_{35}^{40}\left(20+40\cdot\frac{h-35}{5}\right)\frac{h}{50}T_m\cdot dh=\frac{8}{100}T_m$$

$$\int_{35}^{40}(2h-65)\,h.dh=\frac{8}{100}T_m\left[\frac{2}{3}h^3-\frac{65}{2}h^2\right]_{35}^{40}$$

$$=151\frac{2}{3}T_m$$

in Fig. 4; and in Fig. 5

$$\int_{35}^{40}\left(10+50\frac{h-35}{5}\right)\frac{h}{50}T_m.dh=\frac{5}{T_m}\int_{35}^{40}$$

$$(h-34)\,h.dh=\frac{T_m}{5}\left[\frac{h^3}{3}-17h^2\right]_{35}^{40}=133\tfrac{1}{3}T_m.$$

Here the first quantity inside brackets within the sign of integration is the width of the flange at each level *h*.

Summing these three parts, we find the total normal force on each half of the section above or below neutral axis to be—

in Fig. 4.		in Fig. 5.
540 T_m.	Parallel part of flange	540 T_m.
$151\frac{2}{3}$,,	Tapered ,, ,,	$133\frac{1}{3}$,,
245 ,,	Web - - -	$122\frac{1}{2}$,,
$936\frac{2}{3}T_m$.	Total - - -	$795\frac{5}{6}T_m$.

Using these results there is next obtained, by exactly the same methods as those just illustrated, the accompanying tables of total normal force on the vertical section above or below a series of levels distant *h* from neutral axis. In actual design it is, of course, unnecessary to calculate this for so many different levels as here given. The object here is to show the mode of variation of shear stress over the section and to do this by means of diagrams on which the true nature of the curve is correctly demonstrated. Moreover, it is particularly desired to explain the dangerous stress phenomena that arise where sudden change of dimensions occur, and thus to prove the great undesirability of a sudden change of sectional width from full flange breadth to web thickness—that is, the omission of taper on the flange thickness. Therefore, in the following tables, calculations are made for five levels throughout the tapered depth of the flange. It is here, of course, that the shear curve takes a very steep slope and dangerous character.

The 4th column of these tables is to be multiplied by $T_m\ u^2$ to give the Total Normal Force on the vertical section above or below level *h*. If for $T_m\ u^2$ there be substituted $T'_m\ u^3$, the product will give the corresponding *difference* of normal force on two sections at unit (u) distance apart; and if this be divided by u × breadth of section at level *h*, the quotient gives the shear stress at this level on horizontal and vertical sections. Thus the numbers in the last column multiplied by $T'_m\,u$ give this shear stress. Now, $T'_m\ u=u.\ \frac{H}{2I}.\ F$

$$=\begin{cases}\dfrac{F}{71{,}750u^2}\ \text{in Fig. 4}\\[2ex]\dfrac{F}{64{,}686u^2}\ \text{in Fig. 5}\end{cases}$$

In terms of F, the total shear load at each section of the beam, these last are the factors to apply to the numbers in the last column in order to obtain the shear stress at each level *h* in the section. Now, the *average* shear stress over the whole section is

$$\frac{F}{A}=\begin{cases}\dfrac{F}{3{,}000u^2}\ \text{in Fig. 4.}\\[2ex]\dfrac{F}{2{,}250u^2}\ \text{in Fig. 5.}\end{cases}$$

Thus, in order to find the ratio of the actual shear at any level *h* to the average shear, we have to multiply the tabular numbers in the last column by

$$\frac{F}{71{,}750u^2}\div\frac{F}{3{,}000u^2}=\cdot0418\ \text{in Fig. 4}$$

and by

$$\frac{2{,}250}{64{,}686}=\cdot0348\ \text{in Fig. 5}$$

Taking the greatest shear—namely, that at neutral axis—this gives

$$46\cdot83\times\cdot0418=1\cdot96\ \text{in Fig. 4}$$
$$79\cdot58\times\cdot0348=2\cdot77\ \text{in Fig. 5}$$

as the ratio of greatest shear on horizontal and vertical sections to average shear on the same vertical section. With a full rectangular section this ratio is $1\frac{1}{2}$ for homogeneous material. For such a full rectangular section the calculations are, $A=BH$; $I=\frac{1}{12}BH^2$; $M=\frac{1}{6}BH^2T_m$. Total normal force above neutral axis $=\frac{1}{4}BH\,T_m$: Shear stress at neutral axis $=\frac{1}{4}HT'_m=\frac{3}{2}\frac{M'}{BH}=\frac{3}{2}\frac{F}{BH}=\frac{3}{2}\frac{F}{A}$. Here the factor corresponding to the last column in Tables I. and II. is $\frac{1}{4}H=25$ for $H=100$, as in Figs. 3 and 4. This factor is directly proportional to the section-depth.

In Figs. 4 and 5 these stress results are plotted in curve-form. The tensive and compressive stress on the vertical section is represented, as usual, by a straight line. The shear stress on vertical and horizontal sections varies throughout the depth of the web according to a parabolic curve, reaching its maximum at the neutral axis. In Fig. 5, with web of half thickness, this maximum shear is greater than in Fig. 4 in the ratio $\frac{79\cdot6}{46\cdot8}=1\cdot7$. Beyond the junction-corners, between web and flange, the shear stress falls suddenly; but nearly twice as suddenly and through a drop nearly twice as great, in Fig. 5 as in Fig. 4. Throughout the parallel depths of the flanges this shear is precisely the same in Figs. 4 and 5; that is, it is independent of the web thickness for the same T_m, or surface tension and compression. For the same bending moment and the same depth H, however, the T_m in Fig. 5 would, of course, be greater than in Fig. 4.

Applying now the formula

$$S_m=\pm\tfrac{1}{2}\sqrt{T^2+4S^2}$$

to find the maximum shear in oblique directions at each level in the section, from T given by the straight line tension and compression, and from the shear S just calculated, the second set of shear curves in Figs. 4 and 5 are obtained. For this purpose T_m is taken as 100 in each

case, and the neutral axis shears as 46·8 and 79·6 respectively in the two cases. The ratio of T_m to neutral axis shear varies in every beam along the span from zero at the ends to an infinitely large ratio near the middle or wherever F, the total shear load, becomes zero. With the proportions here taken for illustration, the result in Fig. 4 is that S_m increases slightly from neutral axis to top and bottom of web, then suddenly falling off, and again increasing to maxima at top and bottom of flanges, the maximum here being slightly above the maximum at the top and bottom of web, and decidedly greater than the shear at neutral axis.

In Fig. 5 the maximum oblique shear very slightly decreases from neutral axis to the extremities of the web: from these it drops suddenly through a large range, and throughout the parallel thickness of the flange it has precisely the same value as in Fig. 3, finishing in each design at the value 50=half the surface tension or compression, T_m.

These calculations are set out more exactly in Tables III. and IV. With the thick web, the *increase* of shear from neutral axis to junction of web with flange is 2·4; with the thin flange the similar *decrease* is 3·8. Evidently with an intermediate web-thickness there could be attained, if not exact, still a very close approximation to uniform shear throughout the whole depth of the web. This result, however, although desirable in itself, is not of nearly so great importance as the attainment of good proportions between maximum shear and maximum compression and tension.

Next by using the formula

$$t_m = \frac{T}{2} \pm S_m,$$

there are calculated the maximum tensive and compressive stresses in oblique directions at each level of the section-depth. The results are plotted in Figs. 4 and 5 and tabulated numerically in Tables III. and IV. The existence of these normal stresses on inclined sections, as well as that of the shears on such sections, is generally ignored both in practical text-books of design and also in the "drawing office." Hence the absolute need of extravagant values of what are euphoniously termed "factors of safety." The excess stresses thus absolutely neglected are shown in Figs. 4 and 5 by the areas rafined over obliquely. At the neutral axis instead of the normal stress being zero, as very commonly supposed, in Fig. 4 it is 47%, and in Fig. 5 it is 80% of the surface stress T_m. There is compression in the whole of the lower half of the web and tension in the whole of its upper half. Beyond the junctions of web and flange, the excess normal stress rapidly dies away to an amount too small to show in the plotting of the diagrams. In Fig. 4 the tension at bottom of web and compression at top of web is 84¼% of T_m, although the distance from neutral axis is only 70% of that of the top or bottom surface; while in Fig. 5 at the same places the normal stresses are actually greater than T_m—namely, almost 11% greater. This proves that this flange is too thin—not because of its inability to resist shear, but because it would tear or crush by normal stress in the web before fracture occurred in the flanges.

It may be noted that the curves of maximum tension and compression are, throughout the web depth, nearly parallel straight lines. This results from the shear curve S_m being a very flat curve approximating to a vertical line. If the web were so proportioned as to give exactly uniform shear throughout its depth, or S_m constant, then at each distance h from neutral axis, the maximum normal stress would be

$$t_m = \frac{T_m}{H} h \pm S_m,$$

which is a straight line except for the small variation in S_m.

The examination of these figures will suggest several important problems in the proportioning of the dimensions of I-girder sections, so as to attain maximum efficiency in the utilisation of material to resist the stresses produced by bending loads. One of these is the determination of the correct thickness of the web. Another arises from the fact that in rolled and cast beam sections it would be as easy for the manufacturer to make the web of variable thickness as of constant thickness, as is usual. This is not worth attempting in built-up sections except in large bridge-sizes. A third problem is the economical proportion of flange thickness to whole depth H. A fourth very important problem is the rational determination of the least variation of depth H throughout the length of the span. To call a girder whose depth is varied parabolically in proportion to the bending moment, a beam of "uniform strength," is a good example of the grotesque humour indulged in by writers upon what is called engineering "theory," who look upon engineering as a mathematical amusement of the lighter sort instead of as a serious practical art. The title "beam of uniform strength" has been invented by those who neglect the major half of the stresses which produce risk of breakage, and neglect them because their calculation would occasion them a little more labour and mental trouble than is compatible with the due enjoyment of the comedy.

In conclusion,

it should be pointed out that, although in the parallel parts of the flange and of the web the law $S'_v = t'_h$ is fulfilled by the numbers calculated in these tables, it is not fulfilled in any parts of these or other sections where the sectional breadth varies. In such parts the drag due to vertical variation of sheer stress is supplemented by similar drag due to shear-stress variation across the horizontal width of the section, the sum of the two drags balancing the variation of longitudinal normal stress; or $S'_v + S'_h = t'_h$, the suffices h attached to the S' and t' here indicating two different horizontal directions of stress-variation, one transverse and the other longitudinal. The result of this side shear is that at any level where the section-width varies, the tension or compression at the middle is slightly greater than that at the edges of the horizontal width.

In our "Concrete and Steel Supplement," for July 18th we published some of the working drawings of the coal pocket which is now being erected at Gravesend at the Northfleet Works of the Associated Portland Cement Manufacturers, Limited. It was stated in connection therewith that this was being erected on the Kahn system by the Trussed Concrete Steel Company, of Caxton House, Westminster. This was an error. The fact is that it is being erected on the Kahn system with bars supplied by the Trussed Concrete Steel Company, but the actual work of construction is being carried out by the Associated Portland Cement Manufacturers, Limited.

NOTES AND NEWS.

The value of the imports of cement into New York, which had fallen from £75,000 in 1903 to £24,000 in 1904, show a further reduction to £19,000 in 1905. The total importations into the United States have fallen off much in the same way during the three years in question—namely, from £605,000 in 1903 to £277,000 in 1904, and to £220,000 in 1905. The largest supplies come from Germany and Belgium, but these are diminishing year by year as the production in the United States increases. The total production of hydraulic cement in the United States in 1905 is estimated at about 34,000,000 barrels of 380lbs. nett, of which 1,026,502 barrels were exported, the value given being about £278,000.

New Works in Ferro-Concrete. — Subjoined is a list of contracts which have been settled recently by various licensees under the Hennebique patents. The most important works included in the list are the Parkstone Quay Extension and Transit Shed for the Continental Station of the Great Eastern Railway near Harwich.

Two steel wharves, with concrete piers, are to be built at Manila for the United States Government. One of these will be 650ft. long and 110ft. wide, and the other 600ft. long and 70ft. wide. The floor framing consists of transverse plate girders resting on the piers, and carrying between their webs longitudinal lines of 18in. rolled steel joists. Over these is a concrete slab floor 4½ins. thick, reinforced by embedded sheets of expanded metal or wire netting. To protect the face of the wharf there will be wooden fender piles driven in front of it and connected by waling pieces, while spiral springs will be inserted between the piles and the ends of the plate girders. For each concrete pier there are five or seven wooden piles 65ft. to 75ft. long, driven so that they form a core or pyramid above the bottom, with the middle pile 15ft. or 20ft. above the ground. Steel cylinders, of $\frac{5}{16}$in. plate, are then placed over the groups of piles and sunk some 6ft. or 8ft. into the bottom. Above the level of the top of the highest pile the cylinder tapers to a smaller top diameter. The mud is then pumped out, vertical steel reinforcing bars are set in place, and the cylinders are then filled with concrete. At intervals the vertical bars are connected by horizontal hoops and radial bars. The piers are 6ft. diameter, tapering to 3ft. at the top. They are 20ft. apart transversely and 25ft. apart longitudinally.

REINFORCED CONCRETE SYSTEMS.

IV.—The Coignet System.

Undoubtedly one of the earliest workers in both the practice and theory of reinforced concrete construction was M. Edmond Coignet. We referred in an article in our "Concrete and Steel Supplement" for June 20th to the fact that M. Coignet stated, in 1888, before the French Society of Civil Engineers, his ideas regarding the reinforcement of concrete; and that he read, with M. N. de Tedesco, in 1894, before the same Society, a paper on methods of calculation. M. de Tedesco has for long been associated with M. Coignet. To Messrs. Coignet and Tedesco belongs the honour of having first conducted scientific experiments which enabled a rational theory to be established of the stresses and strains in structures of reinforced concrete, and it was from their researches and published information that M. Considère, Inspector-General of the Government Department of Ponts et Chaussées, was induced to interest himself in the subject and carry out, with Government assistance, the extended series of experiments which enabled him to so greatly assist in the determination of factors necessary to a more complete understanding by the engineering profession in general. M. Considère only confirmed, however, as regards the more important factors, results that had been previously obtained by Messrs. Coignet and de Tedesco. Naturally, with the resources which he had at his command, he was able to more fully investigate points that they had to leave for future determination, and he substantiated those facts which they had already satisfied themselves upon.

M. Coignet is not only a qualified civil engineer, but he is

one of the largest contractors in France.

His business was left to him by his father, M. François Coignet, and it was from the practical experience of his father that M. Coignet, with his theoretical training, was enabled to advance as he has done. We referred in the article above mentioned, in our issue for June 20, to M. François Coignet and his patents, and we may repeat that his first patent was taken out in 1855 in both France and England for the making of concrete from hydraulic limes and various aggregates. Béton aggloméré, as this lime concrete made in a special manner was known as, was also called Béton Coignet from its inventor and his large use of it in practical construction in Paris and elsewhere. In the English, although not in the French, patent he referred to the fact that he constructed reinforced floors with crossing rods. In 1861 this Coignet published a pamphlet which has been called his memoirs. In this he advised the introduction of metallic framework to reinforced concrete, and described its various possible applications and the manner in which he had made use of it, so that we see that he antedated Joseph Monier's patent of 1867 which, as we have before stated, only dealt with the construction of flower pots at that time, being extended in 1873 to cover its use for reservoirs, bridges, &c.

M. François Coignet,

as a contractor and inventor of Béton aggloméré, had constructed many large works in concrete, some of which were reinforced with metal. It appears that

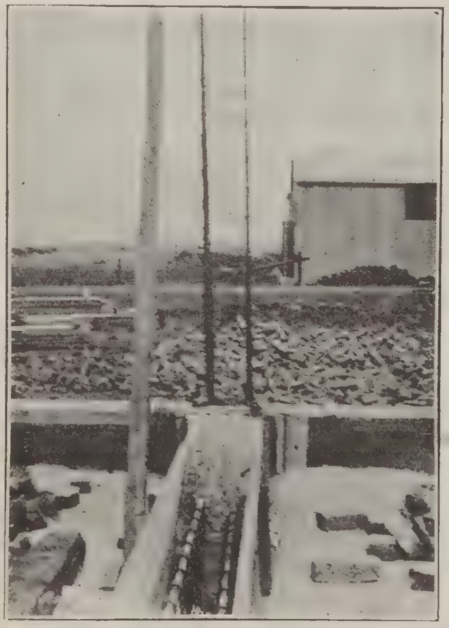

FIG. 9.

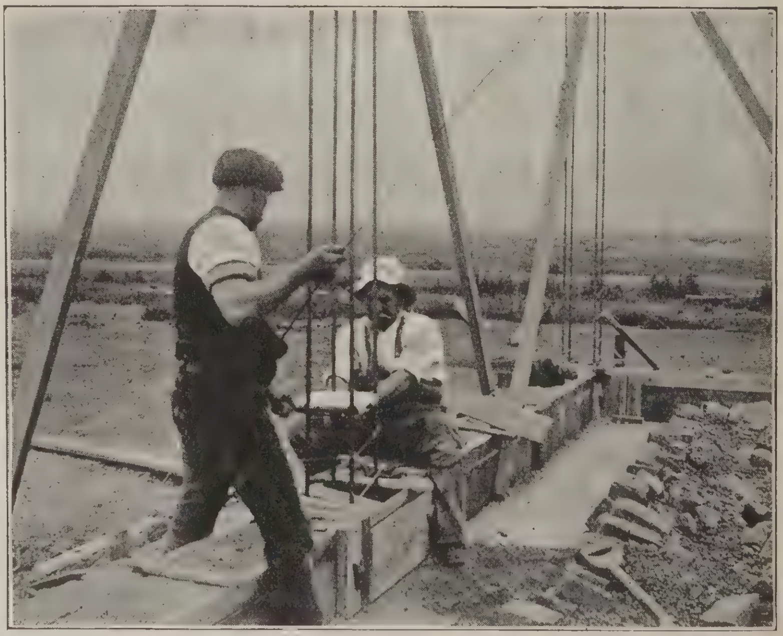

FIG. 10

he constructed over 200 miles in France and at Odessa in Russia, 38 miles of aqueduct for the Paris water-supply from the river Vanne, five miles of which include arches from 99ft. to 132ft. span, the church at Vesinet, near Paris, the high retaining walls of the Passy and Trocadero Cemeteries in Paris, a lighthouse 172ft. high at Port Said in Egypt, &c. M. Francois Coignet died in 1887. Of his work above referred to we publish one illustration herewith — namely, the principal arch of the Aqueduct de la Vanne (Fig. 1). This arch has a span of 132ft., and is reinforced with metal rods at the top only, the rest being of plain concrete. Of course, the application of reinforcement by this contractor was purely experimental, and it was left to his son to determine the method of calculating this reinforcement.

M. Edmond Coignet,

who two years ago established a branch office in this country, was educated at the Central School of Arts and Manufactures in Paris. From the time of his father's death the idea of reinforcing concrete with steel was slowing maturing until 1892, when the whole subject seemed to be in the air, and resulted in Cottancin, Hennebique, Bordenave, and Bonna bringing out their various special systems. In 1892 to 1893 the Ville de Paris proposed to construct the aqueduct of Achères on the old method—namely, constructing circular galleries in masonry, part above and part below ground. M. Edmond Coignet, knowing the advantages which had been obtained by the employment of reinforced concrete, brought the matter before the authorities and offered to construct the aqueduct in reinforced concrete at a much reduced cost over the proposed masonry design. He managed to convince the authorities of the advantages, and he was granted this important contract. The elevated portion was of circular section, 10ft. in diameter, with external stiffening supports spaced about every 6ft. apart; this portion was one-third mile long. The underground portion was elliptical in form, 17ft. wide, and 1½ miles long.

From this time the application of reinforced concrete became general and of ever-increasing magnitude in France. We may mention that the Paris International Exhibition of 1900 was the means of emphasizing the advantages of reinforced concrete, and M. Coignet was responsible for one of the most striking demonstrations in the shape of

The Chateau d'Eau,

which was a much-admired wonder. It was only owing to the peculiar qualities of reinforced concrete that it was possible to execute rapidly such a daring and graceful scheme. M. Coignet was granted the Grand Prix (Class 28) for his works in reinforced concrete at this exhibition, and he also obtained the Gold Medal (Class 29) for the architectural designs of his constructions. The authority which the opinions and experience of M. Coignet have in France is shown by the fact that he is a member, both in the technical and the practical sections, of the Committee which has been appointed by the Department of Public Works to draw up rules for the design of the reinforced concrete structures.

Systems of Reinforcement.

As we might naturally expect from his profound knowledge of the theory and practice of the subject, M. Coignet does not bind himself to any hard-and-fast forms of reinforcement, recognising that special circumstances may require special treatment; yet, on the other hand, of course he has convinced opinions and has adopted certain well-defined methods of meeting ordinary conditions. The rods he uses are of round section and without any mechanical bond.

In Beams

M. Coignet always makes use of top as well as bottom reinforcement. The introduction of these top rods in the compressed portion of the beam adds to the compressive resistance and makes it possible to diminish the section of the concrete, thereby lessening the dead weight of the beam. Another advantage in M. Coignet's opinion is that these top rods help to strengthen a floor when subjected to fire in so far as they suspend the bottom rods and keep them in position if they should be exposed by the action of fire and water. The third advantage is that the use of top reinforcement enables beams to be prepared in the same manner as piles, which can be hoisted into position and made to support the centering for the slab by a special arrangement, illustrated in Fig. 3, in which case the centering may be removed after two days.

The top and bottom reinforcements

are connected by stirrups which serve the purpose of resisting the shear. The manner in which these are placed will be seen in Fig. 2. Round rods of small section are simply turned over at the top and bound in position with annealed wire as shown at D. It is obvious that a fairly good connection is thus obtained between the shear members and the longitudinal rods, and these may be depended upon to resist sliding such as may occur with loose stirrups when the load on a beam approaches its ultimate strength. When the shear is so great as to render it necessary to obtain some rigid connection of the shear members, M. Coignet simply turns up one of the rods in an inclined direction, which he can easily do, for he generally uses a number of rods in the underside of a beam. The spacing of the shear members conforms to the general practice in being closer together towards the points of support as shown in Fig. 4.

The connection of the floor slab

with the beams is illustrated in Figs. 2 and 6. The floor slabs are usually made from 4 to 5ins. thick, with an armature of principal bars running in the direction of the shortest dimensions between supports, and a secondary system of crossing bars of smaller sections than the others as shown in Fig. 5. The crossing rods are bound together with annealed wire at every other intersection similar to what has been called the Monier system. When the span or the load, or both, are considerable, the slab is constructed of greater depth, and in the form shown in Fig. 6, similar to beams with top and bottom reinforcements connected by stirrups. Where such slabs are combined with ribs, the lower principal bars do not rest on the upper compressed members of the ribs as might be supposed from the method adopted with the beams, but run through as shown to the left in Fig 6. Another method is adopted in which the slabs are only 3 or 4ins. thick, supported by ribs spaced only a few feet apart and resting on the main beams or on the walls, shown in Fig. 7. This method is used principally for mills, warehouses, platforms, and generally where the loads are considerable, or the spans between the supports large. These ribs are generally exposed in buildings of the factory class, though in certain cases where the appearance is studied a ceiling is provided and fixed to the underside of the ribs, leaving a space between. When a slab is connected with a beam calculations are based on a **T** section, the slab being assumed to take part of the compression.

Posts, pillars or columns

are made round or square. The longitudinal bars are bound by spiral rods, spaced every 3 or 4ins., annealed wire being used to connect these at all intersections. A section is shown in Fig. 8. We illustrate in Figs. 9 and 10 posts in course of construction showing these spiral bindings. The method by which the work is executed is shown in Fig. 10, where it will be seen one man holds a square piece of wood with a handle to keep the longitudinal rods apart while a small rod is being wound round. Fig. 9 also shows a Coignet beam

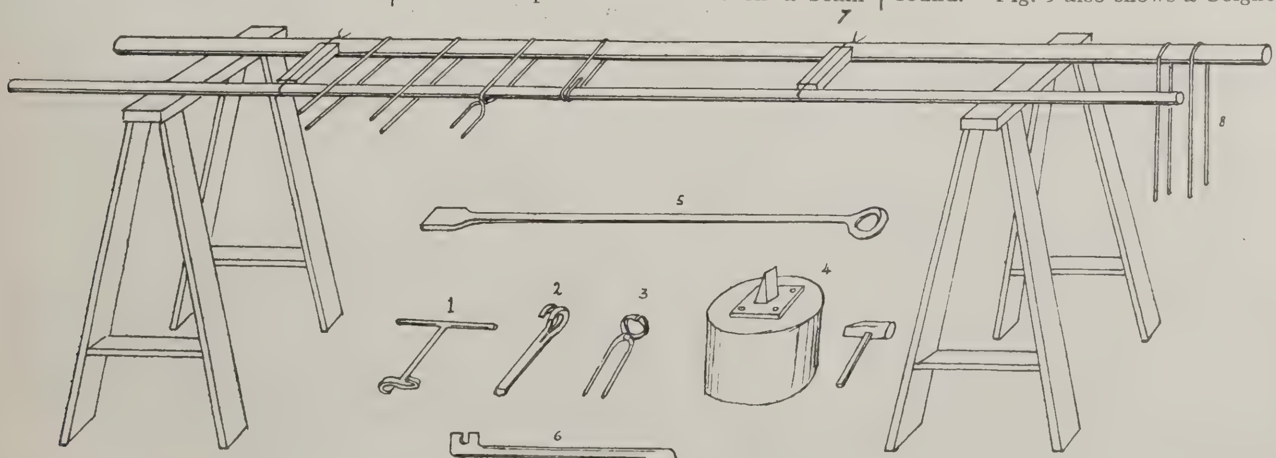

FIG. 13.

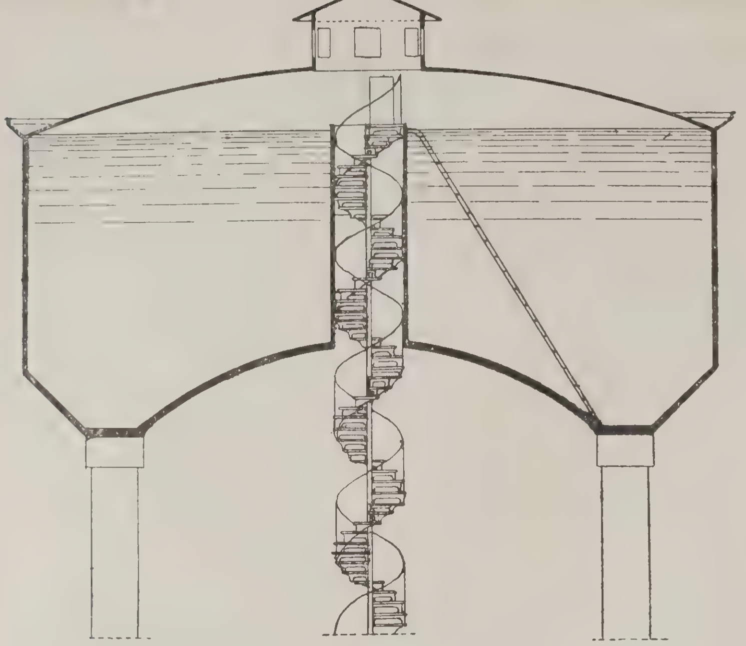

Fig. 14.

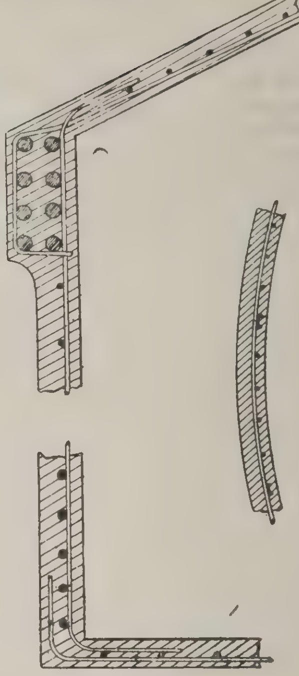

FIG. 15.

with skeleton exposed and concrete partially filled in between the centering. These two illustrations are photographs of the work now in course of erection at Rainham, Essex, which is referred to below. The footings generally used for these pillars are shown in Figs. 11 and 12.

The Coignet piles are also made similar to posts—namely, with rods wound spirally round the longitudinal bars.

The manner in which the beam reinforcement is manipulated will be easily understood from the diagram of **tools and appliances** in Fig. 13. The working drawings which are supplied to licensees indicate the exact dimensions and positions of the various bars. Certain special tools are necessary for bending, twisting and cutting the rods, as also several special trestles for carrying the upper and lower bars which constitute a portion of the framework of a beam during the process of making the stirrups. These two bars are laid parallel to each other on trestles, and kept at the required distance by pieces of wood, as shown at (7) in the figure. These pieces of wood are removed as soon as the stirrups are made, the annealed wire binding these latter to the bars being sufficient to hold them in position while they are placed in the box centering. A special gang of men can be set to prepare these frameworks, which do not need skilled labour. Bars composing the armatures of slabs are arranged on the centering according to the plans.

We may now describe more particularly the tools used for the work. At (1) is shown a twister for making a knot in a stirrup; at (2) is a wrench for bending the ends of stirrups over the top bar; (3) are cutting pliers for making the annealed wire bindings; (4) is a wooden block with chisel on which stirrups are cut to their required length; (5) is a special tool for ramming the concrete round the framework of the beams; (6) is a wrench for bending bars of about $\frac{1}{2}$in. diameter; at (8) are shown stirrups bent in the middle and hanging over the principal bar ready for use.

When the frameworks of beams are placed inside the box centering false pieces of wood are used to keep the armatures in their proper position; the concrete is then thrown into this mould and well rammed round the bars. The principal and secondary bars for the slab are next put into position on the top of the beams and the concreting of the slab then completed. The framework of the slab is lifted during the process of the work in order to leave the required distance between the bars and the undersurface of the floor.

As regards the method of centering adopted by M. Coignet, planks of about 1in. thick are generally used, and care is taken that the centering should be quite rigid in order to stand the ramming of the centering without sagging. The portions of the centering under the slabs can be removed after a few days. The concrete used is generally in the following proportions:—3 parts Portland cement, 5 parts river sand, 10 parts ballast, broken bricks, slag or clinker aggregate. This mixture naturally contracts in volume and in the result there are about $12\frac{1}{2}$ parts of concrete. The weight of such concrete, including the usual percentage of iron, is taken at about 156lbs. per cu. ft. The cement used is slow setting. M. Coignet takes the compressive strength of such concrete at 2,225lbs. per sq. in., but allows in his calculations a factor of safety of $3\frac{1}{2}$, so that 635lbs. is considered a maximum for the fibres bearing the greatest stress in the deflected body. The reinforcement consists of mild steel with a tensile strength of about 58,000lbs. per sq. in. with an elongation of 22 per cent. on 8ins. The same factor of safety—namely, $3\frac{1}{2}$—is taken for steel, the maximum tensile working stress being taken is 16,600lbs. per sq. in.

M. Coignet recently published a statement of the basis upon which his calculations were made, from which it is plain he uses the ordinary methods such as advocated by Professor Ritter and adopted by the German Government. The modulus of elasticity of concrete is taken as fifteen times less than that of steel. The tensile strength of concrete is neglected.

A large tobacco warehouse is being erected at Cumberland Basin, Bristol, at the present time on the Coignet system under the supervision of the Docks engineers, the contractors being Messrs. W. Cowlin & Sons. New premises for Messrs. J. C. & J. Field, Ltd., are also being constructed at the present time on the Coignet system at Rainham, Essex, of which the architects are Messrs. Scott, Hanson & Frazer, and the contractors Messrs. W. King & Son, both of London. Two views of this work are shown above. The foundation work here was somewhat difficult on account of the peculiar and unreliable nature of the ground, which is composed of about 6ft. of hard silt resting on peat.

In our issues for February 15th and 22nd, 1905, we illustrated a bridge at Luxemburg which was constructed on the Coignet system. This bridge is a very remarkable one, and has a span of 256ft. The beams which support the deck platform were made in advance.

A number of reservoirs and tanks above and below ground have been constructed by M. Coignet. Fig. 14 is a sectional view of such as erected at Toulon or Lorient Arsenals and at the water works at Eu, Tréport and Mers. The walls are only about 3ins. thick, including the rendering. The framework is made of upright bars encircled by spiral tie-rods, as shown in Fig. 15. The framework bears the bursting pressure, the concrete being merely considered as a stiffening material and to contain the water.

Fig. 16 shows the armature for pipes adopted by M. Coignet.

A Modern Requirement. IN modern houses, both town and country, there is one detail in the necessary accommodation which is generally overlooked by the architect, namely, the provision of some place for the storage of cycles. In the majority of houses of any size the cycle is generally in evidence, and even in smaller-class property some provision for it is necessary, in view of the fact that so many workmen now go to and from their work on bicycles. One only needs to take as an example some house built, say, twenty years ago, having no separate outbuilding, in order to appreciate the difficulty of keeping bicycles at all conveniently. Even though some room above stairs may be used, it is clearly most unsatisfactory, and the same defect applies to rooms in a basement. Hence, whatever provision is made must be on the ground-floor level. In those houses where no space for the storage of machines has been allowed for, the occupier has to resort to all kinds of ingenuities and contrivances, such as hanging the machine on the wall, or slinging it from the ceiling, and where some sort of an outhouse does exist, more often than not it is so damp and musty as to be quite unsuitable for the storage of bicycles. Architects should bear this point in mind when planning houses. What is wanted is some small space (preferably under the main roof) with a dry floor, and lit through a window, where two or three bicycles can be conveniently kept. It is no use providing a sort of dark cupboard where to stand upright is impossible, because then the machines would have to be pushed in from the back as best might be, which is not at all desirable. It is preferable that the space should be provided in the kitchen or scullery portion of the house and near an outside door. Even if occupants of the house for the time being do not happen to possess bicycles, the space can be made use of for many other purposes.

Insight. An artist is not great because he deals with the abstruse. It is true that it takes a great artist to treat the higher problems adequately, and that his genius is given its greatest opportunity in such work. Genius, however, may be displayed in the most commonplace things of life, so transforming them that we realise in the form given to them something which we feel to be sublime. The artist, indeed, brings to the subject an insight beyond ours. Someone has said that we are all slaves to words. Words generally either too closely define a view or convey a wrong impression. They are deceptive and paradoxical, in that they very often convey the opposite to what is meant. They must necessarily be of the nature of contrast. To our present subject this applies in two ways. In the first place insight is too narrow a term to apply as all-sufficient. The artist must also have a wide outlook. Secondly, the use of the words "art" and "science"—terms which imply a contrast, a divergence from each other—is more often than not wrong in architecture. Neither has a separate existence from the other. Indeed, it ought to be held that they are but two aspects of one and the same thing. Insight and outlook are as all-important in science as in art. The artist, because of his insight, may be held to have proved himself a scientist. He investigates causes and applies the knowledge thus gained to creative work. By insight does he widen his outlook. He looks at things scientifically. Just so the architect of genius. It is too common a fault to laud him an artist, and contrast him with the scientist, when the faculty necessary to his development is what has been called a scientific way of looking at things. The great architect will treat the most commonplace details with an originality that results from a greater insight and a wider outlook than his more ordinary brethren. It is unwise to adulate art and to scorn science. Such conflicting terms would be better left alone and *architecture* practised with intent. If we find anyone saying this or that is engineering, therefore scientific and to be avoided by the artist—so far thou shalt go and no further—we should cry "halt," this is the brink of the unknown, the inner relations of which are indeterminate. Let us take the problem, look at it from every point of view, and effect its solution without worrying as to whether it is within the architect's province or not.

The Newer Joinery. IT is a particularly noticeable feature of modern joinery that the joints are gradually becoming more and more simple than they used to be. Doubtless we should quickly approximate to the methods of American framing were it not that the time-honoured traditional methods are taught to architects in the standard books on building construction. The use of machinery and the saving of time and labour that has been rendered necessary by reason of the increase in wages have alike resulted in changes. The old-time joiner eliminated nails as much as possible. The modern joiner avails himself of them wherever possible. There is much to be said for and against various details, but upon the general issue we think the change is for the better. Indeed, further simplicity would not come amiss. Economy is an important factor, and by care we can achieve almost as lasting a result as by traditional methods. There is, undoubtedly, much beauty in well-executed joinery, but very often it is thrown away by being put in positions where it is never likely to be properly seen or appreciated. Where work is of a monumental character and intended to last for centuries the best work should be insisted upon by all means, and, if economy must be studied, simplicity resorted to, but it is obviously out of place to put too much labour into buildings certain to have a comparatively short life. We are of course strongly against anything like shoddy work where flashy finish is obtained at the expense of durability. The position should be faced frankly and made the best of; the old system has departed and it is no use deploring.

KIRKWALL CATHEDRAL.

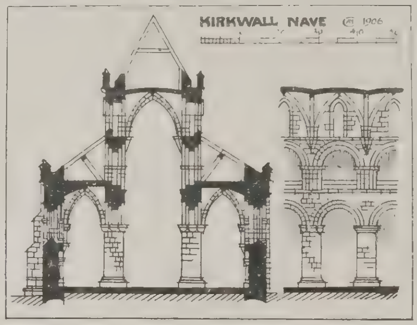
The cathedral of St. Magnus, at Kirkwall, was begun in 1137 and not finished till the sixteenth century. From 1688 till 1846 it was occupied by a Presbyterian congregation; it was then restored by Government, and since 1856 it has again been used as the parish kirk. With such a history the church might well be a jumble of incongruities, if not a mere skeleton of its proper self. Instead of this there is a striking unity of idea throughout the building. Some of the detail, especially of the later portions, rivals the best contemporary English work, and, although the scale of everything is small, the effect produced is, owing to the proportions, thoroughly impressive. Moreover, in spite of the church's history for the last three centuries, it has escaped the crowning degradation of a restoration such as has been perpetrated in too many of our own English cathedrals.

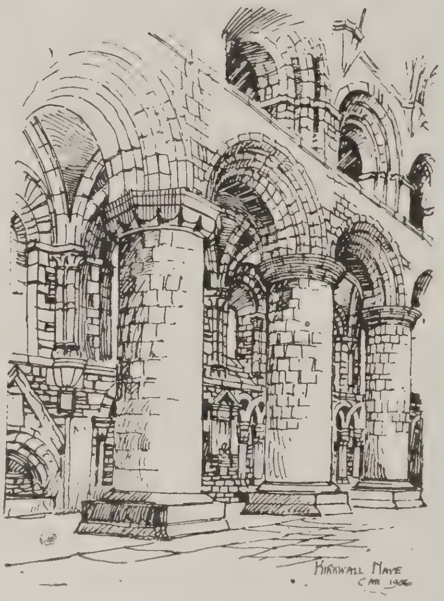
Kirkwall is a second or third class church in point of size, and in this respect it may be compared with Romsey or Norman Carlisle. Its founders, Kolr and Earl Ronald, only completed the choir and transept with one or two bays of the nave. The original plan consisted of an aisled choir of three bays, probably with an apse, a crossing and transepts of two bays each, two transeptal chapels and an aisled nave of six or seven bays.

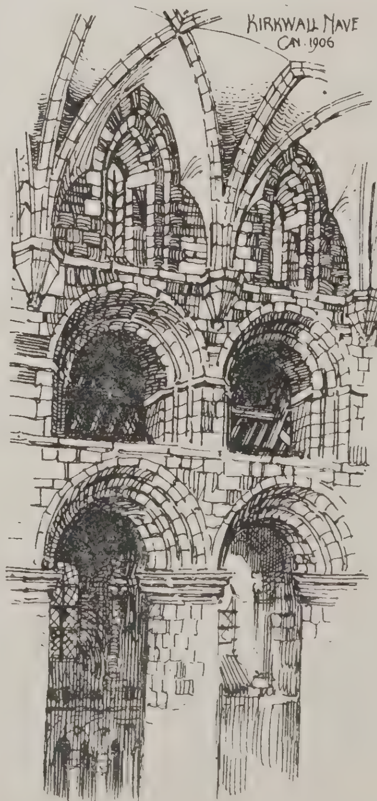
The piers are mostly cylindrical. The arches in the choir are rather richly moulded with dentils and zig-zag notchings, those in the nave and throughout the triforia being in three plain recessed rings, in some cases chamfered. The Norman windows have monolith shafts and moulded arches inside and out; the choir aisles are vaulted with heavy moulded ribs and cross arches. There is a dado of intersecting arcading in the nave aisles and transepts. The choir and transepts were unvaulted, and had dripping eaves on corbels, indications of which remain below the later parapets.

After the dedication of the choir, the church was continued westwards in a leisurely fashion till well on into the thirteenth century. The nave arcade and triforium have round arches throughout, but the round piers of the western part of the nave have moulded capitals instead of the Norman cushion caps used in the earlier parts of the church. The westernmost pair of piers have round moulded bases instead of square plinths like all the others. These are of much later date than the rest, and were probably built in the fourteenth century after the western doorways.

While the nave was in hand, at the end of the twelfth or early in the thirteenth century, the tower piers and arches were rebuilt with keel-shaped coursed clustered piers, square caps carved with angle volutes, and pointed arches with chevron ornaments and rather rich mouldings, and the tower was carried up to the ridge line. Chapels were at the same time added to the north and south transepts, as had been contemplated in the original setting-out of the church. These are vaulted, and have pointed lancet windows with shafts and square carved caps. The outer roof over the south-east chapel consists of red sandstone slabs upon a solid pointed barrel vault; the corresponding chapel on the north side has an ordinary slated roof.



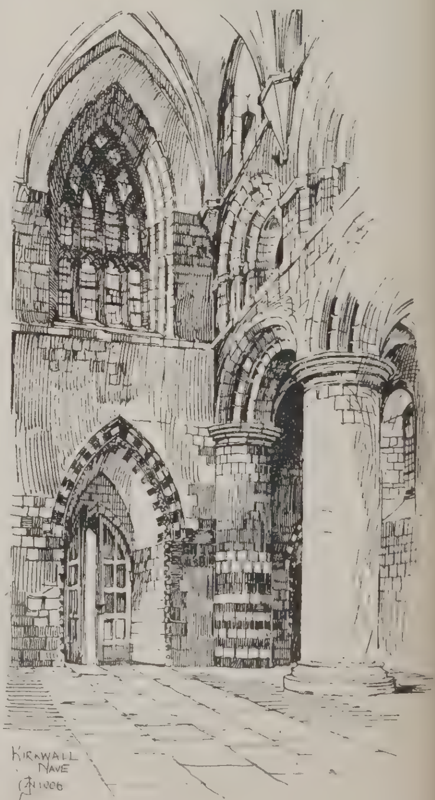




Soon after the completion of the crossing arches the choir appears to have been vaulted in, the transept gables rebuilt or completed, and the building of the nave clearstory and the vaulting of the nave and aisles proceeded with. The high vaults of the choir spring from short vaulting shafts inserted in the old walls, and these vaults have moulded ribs. The nave and its aisles have plain quadripartite vaults with simple chamfered ribs, and no ridge or wall ribs; the high vaults in the nave spring from octagonal corbels at the level of the clearstory string-course; these corbels are finished with carved heads and are somewhat similar to fourteenth century Irish work.

The three western bays of the nave, and two in each aisle were not vaulted till 1846, and then only in lath and plaster, the west end of the nave having been extended at the end of the thirteenth or early in the fourteenth century, and the vaulting of the extension never having been completed—perhaps on account of a somewhat alarming settlement which occurred in the second pair of pillars from the west end during the process of alteration.

Towards the close of the thirteenth century the apse was taken down, the choir lengthened three bays, and the present west front built up to the sill of the west window. A doorway was formed in the south transept front, and the dripping eaves of the choir and transepts were replaced with gutters and parapets, the nave parapets being probably contemporary with the clearstory. The tower was at this time carried up to its present height and capped with a timber spire, which was burnt in 1671.



The work of this period is of great beauty and refinement. The choir extension has round arches on finely-clustered solid piers, the arches richly moulded, the abaci indiscriminately round and square, the caps carved. The triforia over these arches have recessed semi-circular openings in harmony with the Norman work; the clearstory and aisle windows are pointed, with shafts in the jambs and well developed "early Gothic" detail. There is a tall four-light east window with a twelve-bayed marygold filling the whole of its head and a steep crocketted gable over.

The high vaults of the choir seem to have been renewed at this time, some earlier materials being worked in. The ribs are of various sections (10 varieties), and this vault has wall ribs and an arched ridge rib in addition to the ordinary transverse and diagonal ribs. In the eastern bays it springs from vaulting shafts starting from the pier capitals.

The base of the west front is contemporary with, or a little later than, the choir extension; it has three doorways of delightful proportion and delicate detail, and the same may be said of the south transept entrance. These doorways are tall and narrow with great depth of mouldings, rich clusters of monolith shafts, and round foliated caps very much undercut. The nave doorway, which projects with a gable over it, has five orders of mouldings in red and yellow sandstone in concentric rings; the aisle doorways do not project and are each in four orders, as in the transept doorway. The north-west doorway has concentric bands like the central one, the south-west arch is arranged with alternate voussoirs forming continuous stripes or rays across the mouldings; the transept doorway has also alternate voussoirs, but so arranged as to form a chequer pattern on the arch. The shafts are all of red sandstone and much decayed; several members of the mouldings are enriched with dog-tooth, and the gable over the principal entrance was once flanked with pinnacles, which have been destroyed. The red sandstone has stood better than the yellow, and the latter has been repaired with plaster in the case of the south transept doorway, but the texture of the work in its present condition is charming; and it is to be hoped these doorways, which recall somewhat the much richer and larger ones at the west end of Genoa Cathedral, and which are, in the writer's judgment, almost unrivalled in the refinement of their proportion and detail, may be tenderly dealt with in any restoration which awaits them.

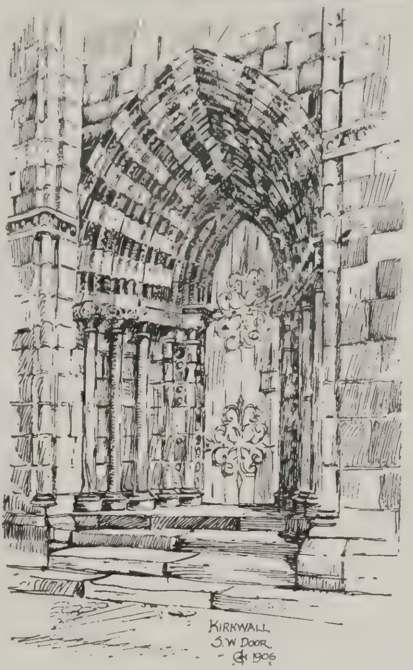
A somewhat earlier doorway in the north aisle has a finely proportioned semi-circular arch on "Early English" columns with a steep gable over, but this has been restored and, to a great extent, spoiled in the process.

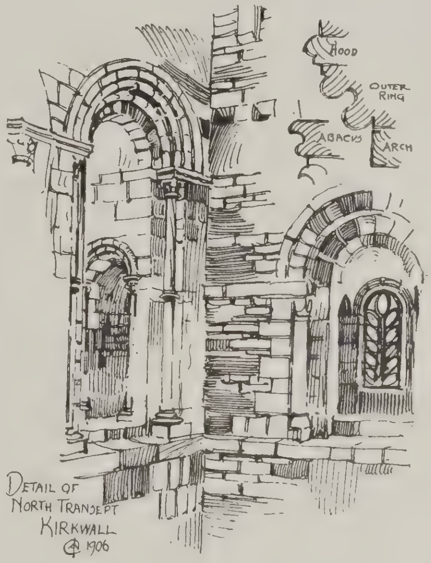
Some portions of the west end of the nave are built in polychrome like the doorways, but the two west bays of the aisles are late fourteenth- or fifteenth-century work with cusped lancet windows, and the upper part of the west front was probably rebuilt by Sir George Hay, of Kinfauns, to whom the lands of the see were leased by the Crown in 1624. His arms are carved over the west doorway, and it is recorded that in 1606 the then Earl of Caithness had begun to pull down the church.

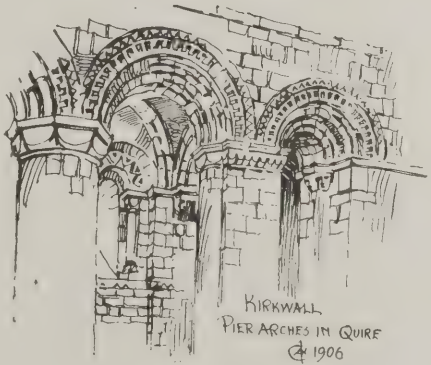
Most of the pinnacles on the different fronts appear to be late work, and may possibly have been added or rebuilt in the seventeenth century.

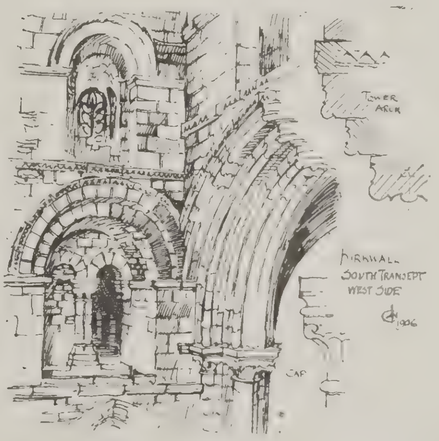
The tower above the great arches is apparently early fourteenth-century work. Its walls are double and honeycombed with passages; the interior is carefully finished, and may have been intended for a lantern open to the church, in which case the bells must have hung in the spire, but this is doubtful, as the tower was burnt out in 1671, and the present floors and roof are of the seventeenth century or later.

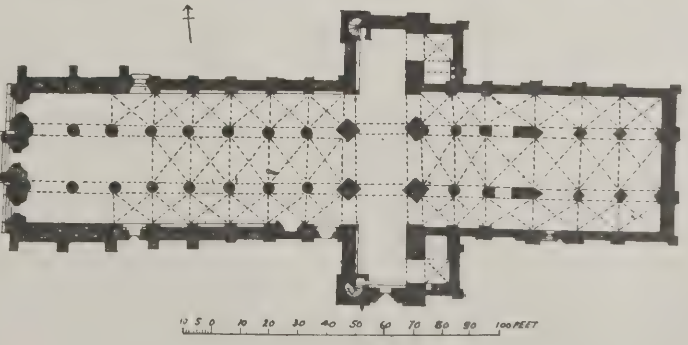
The church contained five altars; there are no remains of the font or of any old glass, but a few fragments of the choir

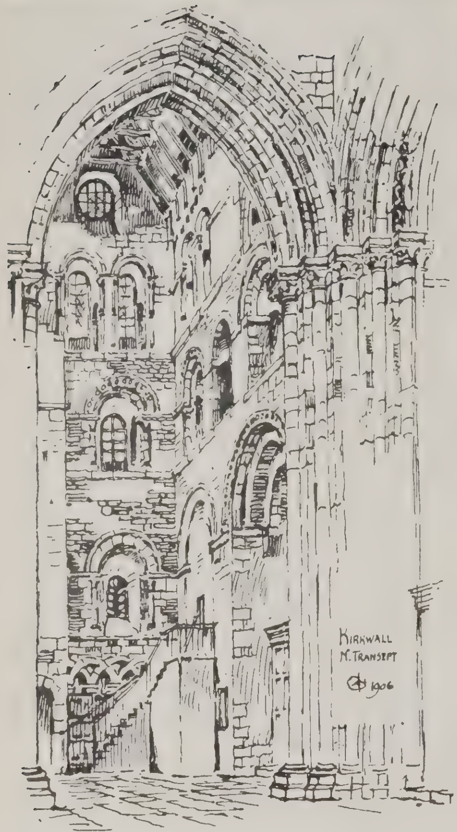












stalls and bishop's throne are preserved in the south transept. The work of these resembles that of the stalls in King's College Chapel at Aberdeen. The church is full of old monuments, some medieval, others of the seventeenth century, some of considerable merit, but of which a mere catalogue would be of little general interest in itself.

The choir is parted from the church by a trumpery glazed screen of 1856, and its proportions have been injured by raising the floor to the level of the old sacrarium. It is pewed and galleried and the triforium arches blocked with lath and plaster; the clearstory, too, is spoiled by having been glazed with double windows on both faces of the wall. Otherwise the church has not suffered at the hands of its occupiers, and it is in many respects well cared for and appreciated.

Apparently in the eighteenth century the windows were all reglazed with wood frames divided by curved wooden sash bars, the effect of which is very good. Unfortunately, several of the windows have been reglazed in modern times in cathedral glass, and two or three of the aisle windows have been embellished with very mediocre figure subjects.

An excellent and concise account of the cathedral has been written by Sir H. Dryden, and the writer of this article must acknowledge his indebtedness to the work referred to for most of the chronological facts mentioned by him. It should be added that the theories of Sir H. Dryden as to the history of the fabric seem justified by the evidence of the architecture.

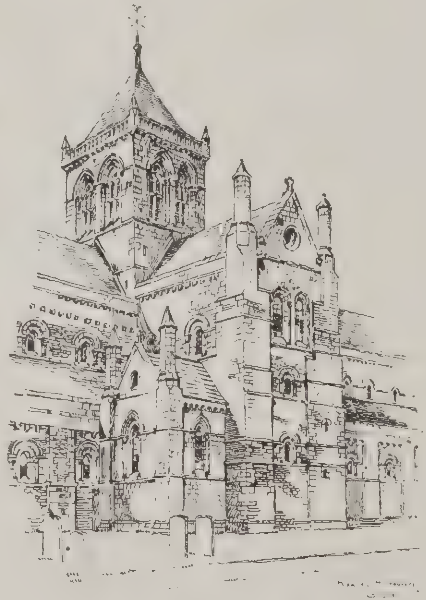
From the point of view of an architect the main interest of the church is the fact that so imposing a result should be obtained upon so small a scale. Externally, no doubt, the extreme simplicity and straightforwardness of the grouping of the four high roofs abutting on the central tower are obvious means of attaining a stately result, and the church owes a good deal to its situation upon a low hillside sloping towards the north-west. Standing in the nave, it is almost impossible without actual measurement to realise the extremely small scale of everything. The total internal length is only 218ft.; width of nave and aisles, 45ft.; width across transept, 89ft. 6ins.

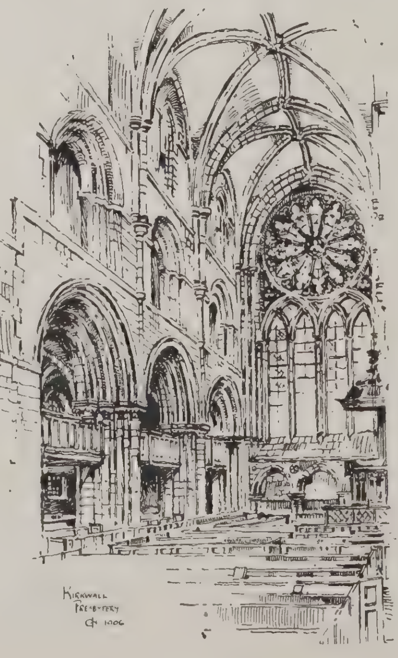
The clear width of nave is no more than 15ft. 2ins. at the east end, and of the choir 16ft. 6ins., while the average span of the lantern arches is only 13ft. 6ins.

The proportions are more lofty than is usual in Britain, the height to the apex of vaulting varying from 47ft. to 48ft., so that the nave is three spans high. Of this height, nearly one-half is given to the pier arcade in the nave, the triforium and clearstory stages being nearly equal.

The pier arches are rather lower in proportion in the choir, and the high vaults of the choir are higher than those of the nave.

Internally the effect of size is no doubt due to the mass and complexity of the support, the spans of the arches being generally less than double the diameters of the piers. And there is great irregularity throughout the building, which no doubt adds to the mystery and complexity of the interior. Moreover the vaulting of the choir drops perceptibly from west to east, and the pavement of the nave rises slightly in the same direction. It is not, however, suggested that there was any conscious attempt on the part of the builders to produce "architectural refinements," unless in the case of the choir vaulting, as the irregularities of the different parts are obviously to be explained by reasonable causes, such as the natural slope on which the church was built, and the leisurely fashion in which it was carried to completion.





Structurally the vaulting is of considerable interest; both the high vaults and those of the aisles are filled up almost to the apex level with solid rubble work, and in this respect they resemble Wren's vaulting at St. Paul's Cathedral. The vaults of the nave aisles, being pointed in section, rise above the triforium string, and there are, consequently, steps from this level in each arch of the triforium leading up to the platform over the aisle vaults.

It is possible that the triforia may have been intended for congregational use. All parts of the church are readily accessible at the various levels from a very complete system of passages reached from two wide newel staircases at the west angles of the transepts. There are four angle staircases in the belfry, which has double walls, is about 100ft. high to the parapet, and contains four bells, the tenor re-cast at Amsterdam in 1682, the second and third dated 1528, and a small bell known as the "skellat" bell. These bells are hung upon beams, and are chimed and not rung.

As for the repairs which were carried out between 1846 and 1856, it is only fair to say that they were effected, on the whole, in a very conservative spirit. The walling generally was, however, disfigured with a good deal of unsightly pointing in cement, and, since the Government restorations, the interior of the nave and transepts has also been scraped and pointed in a somewhat unsympathetic manner. But the condition of the church is a subject for thankfulness, and it is a building that is full of lessons which the wandering architect may read, mark, learn and inwardly digest.

CHARLES A. NICHOLSON.

The New Public Library at Parkhead, Glasgow, designed by Mr. James R. Rhind, has just been opened; also the Carnegie public library at Rutherglen, erected from designs by Messrs. George Sinclair, A.R.I.B.A., and John Ballantine, of Glasgow. The cost of each library has been about £7,000.

The Court of Session.—Plans are being prepared by the Board of Works for the proposed enlargement of the Outer House, or Court of Session, Edinburgh. Several years ago, when plans were submitted for the rebuilding of the entire law courts, involving an outlay of from £40,000 to £50,000, the Treasury objected to so large an expense, and at the time the proposals fell to the ground. Now, however, the question has been revived, and proposals of a more modest character are mooted. The present scheme includes the setting back of the building southwards, on the open space next the Cowgate, and the enlargement of the five courts of the Outer House, the provision of waiting and retiring rooms for witnesses, rooms for officials, and better accommodation for restaurant purposes. Mr. W. T. Oldrieve, principal architect to H.M. Office of Works, has prepared the plans.

Notes and News

Canonbury Tower is to be renovated.

Creed Parish Church has been re-opened after restoration.

The Architectural Association Annual Excursion took place last week, Stamford being the headquarters.

A Sewage Syphon is being built across the Manchester Ship Canal to carry sewage from the Frodsham and Helsby district.

Mr. Somers Clarke, F.S.A., it is stated, has resigned his appointment as architect to the Dean and Chapter of St. Paul's Cathedral.

The New Town Hall and Municipal Buildings at Cardiff, which have cost £300,000, are proposed to be opened on October 17th next.

New Public Swimming Baths at Goole have been erected at a cost of £3,300 from designs by Mr. E. H. Barber, the town surveyor.

American Architects for London.—Messrs. D. H. Burnham & Co., the well-known firm of architects of Chicago, have established an office in London.

A New Central Telephone Exchange at Birmingham is to be built in the vicinity of New Street Station. A London architect has prepared plans for the building.

A Parochial Hall is to be built in connection with St. Jude's Church, Shieldfield, Newcastle-on-Tyne. The architect is Mr. A. B. Plummer, F.R.I.B.A., of Newcastle.

A New Church at Preston is to be erected from designs by Mr. Lacy Ridge, the Diocesan architect. It will, when completed, seat 500 people, and the approximate cost will be £4,300.

The historic Castle of the Forest of Birse, near Aberdeen, which has been for many years in ruins, has now been restored to a habitable condition under the direction of Mr. G. Bennett Mitchell, architect, of Aberdeen.

Important Alteration in Princes Street, Edinburgh.—The Palace Hotel in Princes Street, Edinburgh, which was heightened and enlarged seventeen years ago, is to be converted into shops and business chambers. Messrs. Henry and Maclennan, of Edinburgh, are the architects.

Cost of Buildings in the U.S.A.—In the forty-seven principal cities of the United States, the total value of buildings erected during the year 1905 was £128,110,000. New York City alone erected buildings costing a total of £35,600,000, Brooklyn coming next with an expenditure of £15,000,000.

Huge New Premises for Messrs. W. H. Smith & Son are being erected in Kingsway, at the Aldwych end. There are ten floors, including basement, and the estimated cost of the building is £35,000. Messrs. Cubitt, Nichols, Sons & Chuter, of Howard Street, Strand, W.C., are the architects.

An Old Pine Roof.—The chancel roof of the historic parish church of St. Botolph at Boston, Lincs., was recently said to be in danger. Mr. W. S. Weatherly, F.R.I.B.A., the architect, reported that the roof is a pine one, that it has stood for over 500 years, and would have stood longer but for decay caused by worms. There was danger that the decay would spread. The corporation, who are responsible, have decided to proceed with the work of renovation, which will cost about £1,000.

Sanitary Fittings and Appliances for Italian Houses.—Our Consul at Naples reports that much more attention is being paid to the sanitation of houses in South Italy, and British manufacturers should find an opportunity for business in this direction, as it is incontestable that they have a pre-eminence in household fittings of the kind.

Electric Furnaces for Steel Production in Scotland.—A syndicate of London and Glasgow financiers will, it is said, apply in the next session of Parliament for powers to use the waters of Loch Awe, in the Western Highlands of Scotland, with a view to generating electricity. They propose to lay down electric furnaces for producing steel by a process hitherto unknown in this country. The intention is to carry the water for some miles to a power-house, from where the electric energy would be transmitted by overhead cables to the steel works to be erected at North Connel, on the western seaboard.

Holy Trinity Church, Hull, is stated to be in a dangerous structural condition. The foundations have settled, and as a result there has been what is called "flushing" or "flaking" going on in the arches, and the tower is gradually leaning more and more to the west and south. Mr. Fox, the well-known engineer, has been consulted, and also Messrs. Thompson & Sons, the builders, who have had much to do with the restoration and strengthening of cathedrals. Their united advice is that the matter has gone so far as to demand immediate attention. It is expected the cost of repair will be between £4,000 and £5,000.

A Greek Church for Cardiff is to be erected from designs by Messrs. James and Morgan, FF.R.I.B.A., of Cardiff. It is designed in Byzantine style, the plan being that of a Greek cross. The portion first to be built comprises the nave, narthex (with gallery over) and sanctuary. Future extensions will include the north and south transepts. The centre portion of the nave will be covered by a large copper dome 28ft. in diameter, from which light will be obtained through sixteen windows. The roof of the sanctuary is also covered by a copper dome. The elevations will be in red brick and Bath stone dressings. The cost is estimated at about £2,000. Messrs. Knox and Wells, of Cardiff, are the contractors.

A New Church at Ellel is being erected from designs by Messrs. Austin & Paley, of Lancaster, at an estimated cost of £6,000. The church is in the late Decorated style, and consists on plan of a nave of six bays 72ft. long by 21ft. wide, the north aisle extending the same length 11ft. wide. Four large circular piers, 4ft. 10ins. in diameter, will carry a tower and spire, at the crossing. The roofs will be open timbered with plastered ceilings. The nave and chancel are to be covered with red tiles, and the aisle roof with lead. The church will be built of local stone for walling and Darley Dale stone for dressings, inside and out. The work is being carried out by the following local firms:—Masonry, Arthur O. Thoms; carpentry and joinery, James Hatch & Sons; tiling, R. Hall & Sons; plumbing and glazing, Rushton & Pinch.

The Borough Theatre, Stratford, has been re-decorated and overhauled in every particular. The scheme of decoration is rich and harmonious, the prevailing tints being cream and salmon relieved by gold, the whole set off against the crimson paper on the walls and the deep copper-coloured draperies. The seating has been re-upholstered, and the building entirely re-carpeted. The electric installation has also been improved, and all woodwork and stonework re-painted and restored, so that the theatre has the appearance of a new building. The work has been carried out by the well-known firm of Messrs. F. De Jong & Co., of Camden Town, under the personal direction of Mr. Hillier Pyke, architect to the proprietress.

Obituary.

The late Mr. W. H. Attwood, builder, of Polegate, Sussex, died worth £29,147.

The late Mr. John Wills, architect, of Derby, left estate which has been proved at £15,975 gross.

Mr. T. Barnes-Williams, F.R.I.B.A., F.S.I., senior partner in the firm of Barnes-Williams, Ford & Griffin, architects and surveyors, of London, E.C., died recently, aged 59.

Law Cases.

Appeal Case under the Amended Building Act: London County Council Defeated.—On Wednesday last at the Surveyors' Institution was heard the first appeal to the Tribunal of Appeal under the London Building Act (Amendment) Act, 1905, which now affects new buildings only, but from January 1st next will be retrospective. The case in question arose out of the refusal of the Council to pass the plans prepared by Mr. Percy B. Tubbs, F.R.I.B.A., for a building in course of erection in Leather Lane. The building is to be of fireproof construction, with steel and concrete floors and brick-enclosed staircase of L.C.C. pattern. The Council insisted on (1) the placing of clear, fire-resisting glass in the teak doors of the building, (2) the provision of doors to shut off the basement stairs, and (3) the placing of a smoke-check lobby, ventilated into the open air, with double doors leading out of every room. The building having only one room of 25ft. by 24ft. on each floor, the Tribunal of Appeal decided that the requirements of the London County Council were unreasonable, and decided in favour of Mr. Tubbs, with fifty guineas costs.

Workmen's Compensation.—In the Liverpool Nisi Prius Court recently the case of *Marsh & Fretwell v. Coulthurst* was decided. The plaintiffs were Messrs. Marsh & Fretwell, joiners and builders, carrying on business at Darwen, and the defendants Messrs. H. J. & A. Coulthurst, ironwork contractors, also of Darwen. The action was brought to recover moneys paid to a claimant under the Workmen's Compensation Act. In August the plaintiffs were erecting a mill near Darwen, and the defendants were carrying out the erection of the ironwork. A man named Duckworth, employed by the plaintiffs, was injured by the fall of a derrick belonging to the defendants, and the injuries terminated fatally. In the first instance, Duckworth himself brought a claim under the Workmen's Compensation Act against the plaintiffs, and obtained an award; and after his death his widow obtained further compensation from the plaintiffs. Contending that the defendants were in fact the responsible parties, the plaintiffs sought to recover the moneys so paid. For the defendants counsel argued that, as subcontractors, the defendants could not be held reponsible. Mr. Justice Bray said that the defendants owed a duty to the workmen engaged on the building to take all proper precaution to prevent accident. The cases cited by counsel, in his opinion, did not fully apply to this case, and therefore he found for the plaintiffs, with costs, for £165. A stay of execution was granted on the usual terms.

Builders and Architects' Certificates.—The case of *Chapman v. Burley*, heard first at the Leicester Assizes, was recently decided in the King's Bench Division of the High Court of Justice. The action was brought by Mr. James Chapman, builder, against John Henry Burley, of Leicester, to recover £475, alleged to be due under a contract. In March, 1903, the plaintiff agreed to erect five shops in Leicester for the defendant for £3,990, and an architect was appointed by the defendant. The plaintiff only executed bricklaying work, and left the architect to make arrangements for the other part. According to the terms of the contract, the plaintiff was not entitled to call on the building owner for a payment on account until the value of the work executed amounted to £650. Before this amount of work had been done, and without any request from the plaintiff, the architect certified that the sum of £500 was due to the plaintiff, and the defendant made out a cheque for the amount, payable to the plaintiff, and handed it to the architect. This cheque never reached the plaintiff, whose signature was forged both in the case of the cheque and the receipt attached to the architect's certificate. Other sums were obtained from the defendant in a similar way. The result was that the defendant had in fact paid his architect for the whole of the work upon certain certificates given by him and by cheques which never reached the plaintiff. The plaintiff and the sub-contractors had received £2,691, and the action was brought for a balance of £475. The question was whether the plaintiff was bound by the payments which had been made by the defendant to the architect. Under the contract the architect was not the agent of the plaintiff to receive payment. Mr. Justice Walton said he could see no reason for throwing the loss on the plaintiff, and therefore he held that the money had not been paid, and the plaintiff was entitled to sue for whatever was properly due.

SCHOOL AT CHIPPING ONGAR.

This building is being erected by the Guardians of the Hackney Union for the education of the children to be placed in their cottage homes recently erected on adjoining land, for whom the accommodation of the town schools is inadequate. The school is designed for 300 children, with a possible extension for an additional 120, the hall and cloak-rooms being sufficient for the larger number. Mixed classes are contemplated. The work is plain and substantial, and in detail follows closely the other buildings on the site. The builders are Messrs. F. & E. Davey, Ltd., of Southend-on-Sea, and the architect is Mr. W. A. Finch, of 76, Finsbury Pavement, E.C.

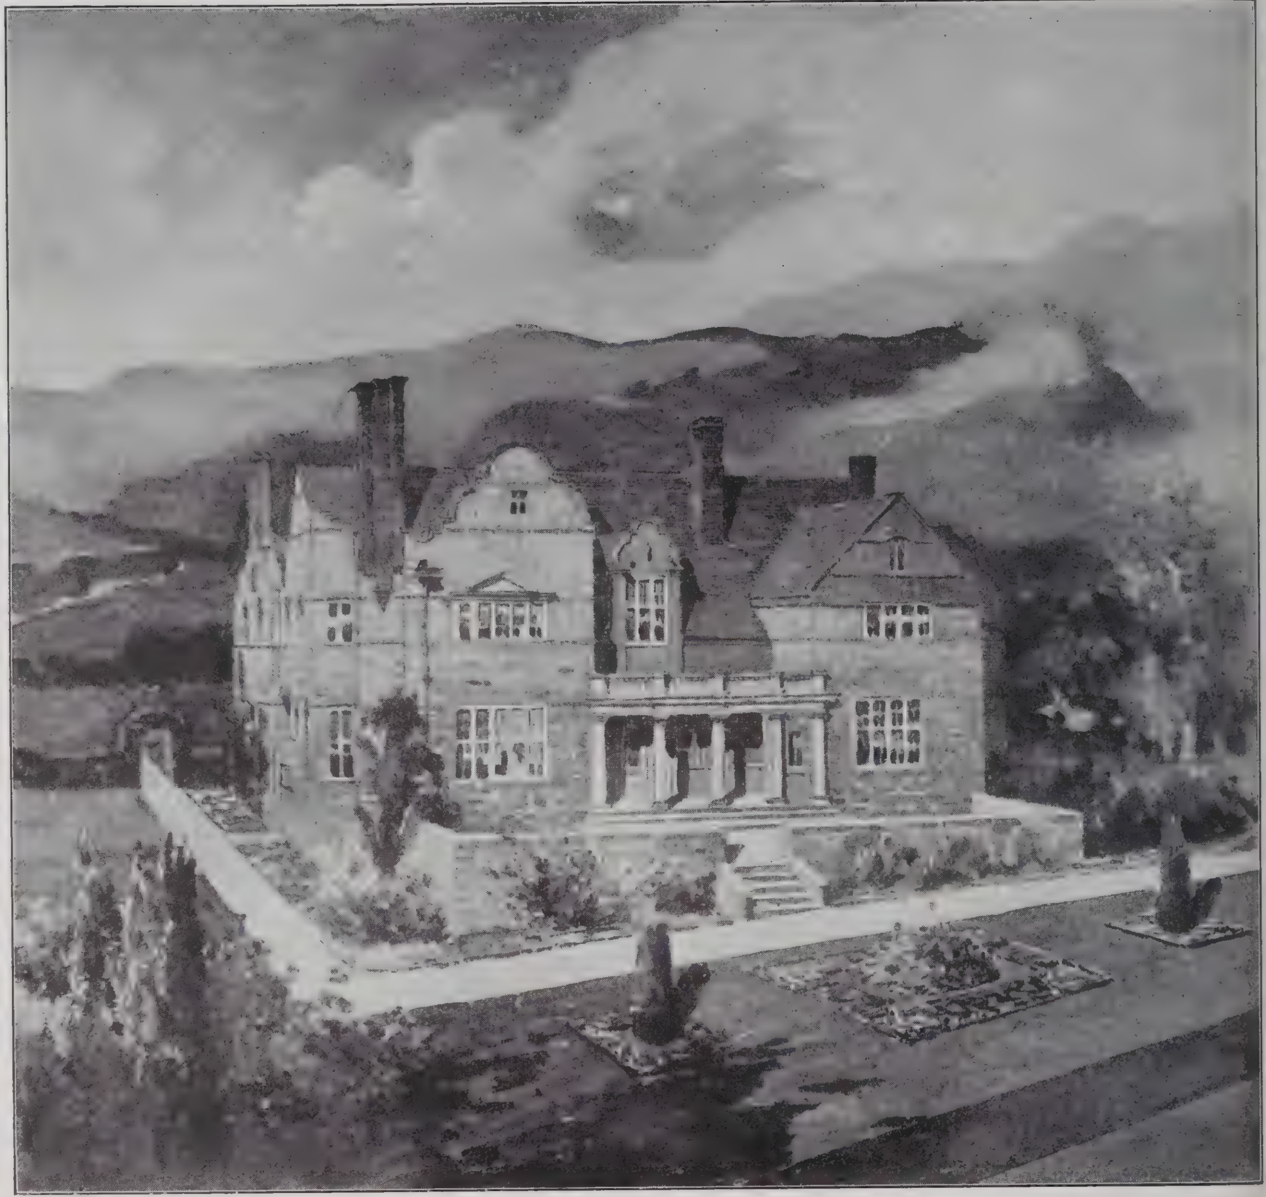
Supplement to
THE BUILDERS' JOURNAL AND ARCHITECTURAL ENGINEER,
Wednesday, August 22nd, 1906.



HOUSE ON THE DOWNS, LYMINGE, HANTS. ARTHUR T. BOLTON, A.R.I.B.A., ARCHITECT.

The site for this house is about 500ft. above sea level, and very exposed. The walls are accordingly designed 2ft. thick on the principal fronts and built, with a hollow space, of Kentish rag and brick inside lining. Parts of the house are hung with local tiles as a weather covering, the brick walls being built hollow up to the first floor. The site is chalk close to the surface, and has a considerable fall. The excavated chalk forms the filling-in of the terrace, which is faced with Kentish rag rubble walling. By reason of the splendid view from the garden front, a recessed verandah, or portico, with columns and entablature of wood, forms a feature of this side of the house. It is arranged with a flat terrace roof, accessible from the first-floor bedrooms by steps. The hall receives a clearstory light on account of the collection to be displayed in the cases forming part of the internal fittings, as marked on the plan in between the pillars of the screen to the outer hall, and in the side recesses. The plan is laid out to suit the special ideas of the owner. The reception-rooms are larger than is usual and there are fewer bedrooms, but they are of good size. It was proposed to have two bathrooms. The cost is estimated at £3,000, on the basis of 9d. per foot cube.

Enquiries Answered.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication

R.I.B.A. Examinations.

ABERDARE. — SET SQUARE writes: "Which of your issues contain answers to questions set in the past R.I.B.A. Intermediate and Final Examinations?"

Model answers to questions set in the Intermediate Examination this year were published in our issues for July 11th, July 25th, and August 8th, and answers to the questions set in the Final Examination are in hand, and will be published as soon as possible. Answers to questions set in 1899 will be found in Vol. X.

Model By-Laws.

LEE.—SUBSCRIBER writes: "Where can I get a book on the model by-laws as required by district councils?"

"Knight's Annotated Model By-laws," price 16s. post free, from our offices.

Municipal Architectural Work.

DUNDEE.—SUBSCRIBER writes: "Having had six years of architectural training, I am desirous of qualifying for municipal work, and intend taking the examination held for sanitary engineers. Do you consider this to be of any advantage?"

You do not state exactly what examination you propose to go in for. There is that of the Royal Sanitary Institute and that of the Institution of Sanitary Engineers, either of which would be advantageous to you. But the best certificate would be that of the Association of Municipal and County Engineers. Apply to the secretary, Association of Municipal and County Engineers, Victoria Street, S.W.

FAREHAM.—A. S. writes: "I am 24 years of age, and am at present an assistant in a civil engineer's office, having been two years as such, and served five years as articled pupil. I am now desirous of entering a municipal office. I have passed the examination of the Incorporated Association of Municipal and County Engineers, and I now wish to know whether, with the certificate of the Royal Sanitary Institute, I should be in a better position to obtain an appointment in a municipal office, or would the other certificate be sufficient to testify as to my knowledge in sanitary science?"

You do not say which examination of the Municipal and County Engineers you have passed, whether the Graduates' or Associates' examination. With your other experience the Graduates' should be quite sufficient to secure for you an assistant's post with a municipal engineer, and the Associates' examination would be sufficient to get you one of the minor engineerships for a district council, &c. The Royal Sanitary Institute certificate would be of value in addition. As you have spent so much time in a civil engineer's office, it would be well for you to enter for the sanitary science branch of the examination, but you must not forget that the minor engineers' posts are often associated with sanitary inspection, so that a knowledge of sanitary inspectors' duties might therefore be advantageous to you.

Mr. Henman's Ventilator.

CROYDON.—INLET writes: "Where can I get particulars and prices of an automatic regulator for inlet ventilators devised by Mr. Henman, and mentioned by him in a paper on Ventilation read before the Architectural Association on November 11th, 1904."

Mr. Henman's paper was published in our issue for November 16th, 1904, and in that issue were given some illustrations and particulars of the automatic regulator devised by him (it is made by Messrs. Hart, Son, Peard & Co., Ltd., of 138-140, Charing Cross Road, W.C.). The regulator consists of a metal hopper with curved back in which a flap is hung on leather hinges, so as to prevent any clicking noise. This flap remains stationary in calm weather, allowing 3½ins. of space for the inlet of air, but in windy weather the flap is deflected and the area of the inlet proportionately reduced, thus automatically securing a uniform supply of air.

Claim for Damage done to Drawings.

LONDON.—R. N. writes: "In competition I prepared mounted designs of a public building for a municipal body, which were delivered personally under brown paper covering only. These were eventually returned to me, through carriers, without any cover, with a big hole through them, done in transit. Have I any legal claim, and against whom? The carriers inform me they cannot entertain any claim, as they were valuable drawings and should have been packed properly for delivery through their agency."

You should apply to the promoters of the competition for compensation for the damage done to your drawings, but it is doubtful if they will accept any responsibility; and, unless there was an undertaking to this effect, we doubt if you could obtain redress.

Civil Engineering for Architecture.

LONDON.—W. A. B. writes: "A student who has lately completed his pupilage under an architect wishes to change his profession to that of a civil engineer. How would you advise him to set about doing so? Is it possible for him to become a member of the Institution of Civil Engineers without being re-articled to a corporate member of that profession and, consequently, paying another premium?"

It is possible to become an associate member of the Institution of Civil Engineers by passing their open examination. You will need to go in for an extended course of study, both practical and theoretical. We would advise you to obtain instruction at the best engineering school you can conveniently reach, and to apply for a situation (however small and unremunerative it may seem) with an engineering firm, advertisements of which constantly appear in the engineering papers. You might also advertise for a situation in the same journals.

Examination for A.M.I.C.E.

DUBLIN.—J. F. writes: "Where can I get particulars of examinations for the A.M.I.C.E. degree?"

Particulars of the examinations held by the Institution of Civil Engineers may be obtained from the secretary of the Institution, Great George Street, Westminster.

Becoming an Instructor in Building Construction.

EAST HAM.—H. J. writes: "What examinations must I pass in order to become a teacher of building construction?"

There are special examinations that teachers of building construction are forced to pass, but undoubtedly applicants for such posts have not much chance of being selected unless they have passed well-recognised examinations such as those of South Kensington, the Royal Institute of British Architects, or the Surveyors' Institution.

Algebra for R.I.B.A. Intermediate Examination.

LYTHAM.—I. W. T. writes: "Is it necessary to know algebra for the Intermediate Examination of the R.I.B.A.? If so, how far do you consider it necessary to go?"

You certainly need to have a knowledge of elementary algebra for this examination, but we think it sufficient if you study the subject as far as the solution of quadratic equations. We strongly advise you, however, to study the subject much more thoroughly than this, as you would find it of invaluable service in the practice of architecture.

Architects' Assistants for Canada.

HEATON MOOR.—S.E.B. writes: "What chance is there of employment in Canada as architectural assistant, and in what towns?"

There are undoubtedly good prospects for employment of architects' assistants in Canada. The older settled portions, however, do not offer such good opportunities as the towns in the North-West, which are growing rapidly. In our opinion, no one should settle upon any definite course when going out to Canada. They should possess sufficient to keep them for some months, and so be able to investigate conditions on the spot. Therefore we do not care to suggest any particular towns, as there are undoubtedly opportunities continually occurring in the smaller districts and whereever Government posts are established. Our latest information is that Winnipeg, Regina and Edmonton are towns where there are openings. You will find further information in replies to enquiries in our issues for May 9th and June 13th.

Stone Slates: Buildings near Banbury.

Referring to the replies to enquiries under the above heads on p. 83 of our issue for last week, E.G. writes: "If B.P. requires stone slates he need not go so far afield as Stow-on-the-Wold (which is in the north of Gloucestershire, not in Somersetshire, as stated). They can be obtained within 20 miles of Woking—at Horsham, Sussex, and as with such work it is not merely a question of obtaining slates, but *slaters*, this should be an advantage. With regard to Banbury, Compton Wynyates appears to have been unaccountably overlooked, and I think Bloxham, Adderbury and King's Sutton churches were also worthy of mention. The Globe Room at the Reindeer Inn in Banbury may be particularised as a sumptuous example of Jacobean work."

A Fortnight's Tour in England.

IGEL writes: "Kindly give me some hints for a fortnight's holiday in England. My requirements are, a pleasant locality and good sketching material—Renaissance for preference. My own idea is Norfolk and Lincolnshire."

Opinions as to the best sketching ground in England are bound to differ very considerably, but there are few districts in England which can compare with the Nene Valley as a veritable happy hunting-ground for the student of architecture. This district contains some of the finest churches in England, such as Higham Ferrers, Raunds, Woodford, Denford, Strixton, Stanwick, Hargrave, Kingstad and Rushden, as well as some of the finest Renaissance buildings, amongst which is Wollaton Hall. You should refer to Mr. J. Alfred Gotch's "Architecture of the Renaissance in England," in which you will find many fine examples from the district mentioned. Both Lincolnshire and Norfolk are very rich in Gothic work, but the Renaissance examples are few and far between, and as your tour is confined to a fortnight, you would do much better to go to the Nene Valley, where the distances from one fine building to another are remarkably short.

H. Y. M.

District Surveyor's Fee.

WIMBLEDON.—L. D. writes: "A portion of the drainage to a house with four floors including basement (less than 400ft. super. in area) has been reconstructed. What fee is the district surveyor entitled to? No alterations to the building have been carried out."

I am of opinion the correct fee for the district surveyor would be £1 (see schedule III., Part 1, of the London Building Act, 1894.)

F. S. I.

Council's Refusal of Plans.

H.O.C. writes: "The accompanying plan (not reproduced) shows, in red, four cottages which it was proposed to build on a site indicated in green. The plans were submitted to the town council, who refused to sanction them, on the ground that the erection of the cottages would be the commencement of a new street. As the owner of the site coloured green does not own any of the surrounding property, and has no intention of constructing a street, do you consider the council's objection is a valid one? The plans of the houses and the air-spaces both in front and rear are in accordance with the by-laws (a copy of which is sent)."

Your drawings appear to be quite in accordance with the by-laws of which you send a copy, and you appear to have allotted a sufficient air-space to meet the requirements of by-law 29. I am aware of no provision in the "Public Health Acts" which enables the sanitary authority to refuse these plans, and I am of opinion that they are exceeding their legal power in so doing. In many towns rows of houses may be found arranged exactly as in this case (*e.g.*, Leicester, where they are locally known as "avenues"). You would, I think, be well advised to press these plans upon the authority, as, I believe, a mandamus could readily be obtained to compel them to accept them as presented. F.S.I.

The Rebuilding of San Francisco seems to be making great progress, though the supply of labour is stated to be very short. During July 470 permits were issued for buildings of a total value of £702,800, 66 permanent buildings were under construction, 4,500 temporary buildings, and 25,000 men engaged on the works; 100 carts of *debris* were being removed daily.

Notes on Competitions

The North of England continues to hold top place for competitions which leave something to be desired. The most recent instances are from Yorkshire and Durham, and both are marked by the spirit of parsimony which has for its end the saving of money at the expense of the architect.

High School for Girls, Barnsley.

In this competition applications are to be made by architects, stating particulars of secondary schools built from applicants' designs; success of applicant in similar competitions; the amount of commission (stated as a percentage on the amount for which the contracts are let) the competitor will be prepared to accept in the event of his plans being accepted. It is proposed to select from the applicants a limited number of competitors who will be asked to submit plans. Now, this is simply laying a competition open to the lowest bidder, and, other things being equal, the lowest bidder will be, no doubt, the one entrusted to carry out the work. This is a regrettable state of affairs, and one which other professions would find a means to remedy. It has been pointed out to the Governors of the school that the scale of charges recognised by the Royal Institute of British Architects should be adopted, in the interests both of the competitors and of the promoters; of the former because the best efforts of the selected competitor ought to be met by reasonable compensation; of the latter because the selection only of such architects as are willing to accept terms below the customary rates will exclude the very men it would have been most desirable to have had compete. No reply to these arguments has yet been received. It is to be hoped the Governors are not being encouraged by the applications of architects in the North.

Cottage Homes, Cleadon, South Shields.

Here again the remuneration clause has an ugly look, although, it must be admitted, fears as to fees are the result of a knowledge of Northern methods. The conditions state that "the architect whose plan is selected by the guardians will be employed to carry out the work (upon terms to be arranged)." This statement is too ambiguous to be accepted without further enquiry by intending competitors—that is, if anybody proposes to be rash enough to become a competitor under a condition which leaves the question of assessing by an expert an open one. To quote clause 2 of the conditions, "The guardians may themselves select the plans which, in their judgment, will best meet their needs, but they reserve to themselves the right of calling in a technical adviser, and in any case their decision shall be final and binding upon all competitors." So, even if the guardians avail themselves of the option of calling in a technical adviser, there is no guarantee that they will abide by his selection. Furthermore, a "technical adviser" might mean anything from a jerry builder to the President of the Local Government Board. The conditions are dated August 11th, 1906, and the plans, &c., are to be delivered by September 11th next. This is insufficient time for the mature consideration of schemes and the preparation of designs for five pairs of semi-detached cottage homes two or three storeys high, an administrative block including accommodation for twelve children, a receiving home with accommodation for thirty children, &c., and a report and estimate. This competition has one favourable feature. No deposit is required for the conditions, but the conditions are unaccompanied by a site plan. The site plan is to be obtained by payment of one guinea, which sum is returnable to all who send in designs. Competitors are able thus to ascertain the nature of the competition before committing themselves to a deposit, which, in ordinary circumstances, they are often unable to get returned. It is not unreasonable to expect that a site plan obtained in this way would be accurate. The guardians, however, will accept no responsibility in the matter, but leave architects to satisfy themselves as to the accuracy of the plan and any figures thereon.

In this instance, as in the former, representations have been made by the Competition Reform Society, to the promoters, with the object of obtaining a revision of the conditions. May their efforts be crowned by the success which has attended several recent actions having for their aim the same desirable end.

Carnegie Libraries, Dundee.

A deputation of Dundee architects is to wait upon the Town Council to request that competitive designs be invited for the two new branch libraries to be erected there. Such a course is stated to have the approval of Mr. Carnegie, the donor of the money. Hitherto such work has been done by the City architect.

List of Competitions Open.

DATE OF DELIVERY	COMPETITION.
—	PREMISES FOR LEVEN REFORM CO-OPERATIVE SOCIETY, LTD. Particulars from D. C. Wilson, sec.
Aug. 31	HIGH SCHOOL FOR GIRLS AT BARNSLEY. Applications by this date to W, P. Donald, clerk to the Governors, Education Office, Barnsley. Premiums of £100, £50 and £20.
Sept. 3	NEW SECONDARY SCHOOL AT MEXBOROUGH, ROTHERHAM. Limited to architects practising within 35 miles of Mexborough. Particulars from J. W, Hattersley, Secretary to Governors of School, Mexborough.
Sept. 6	LABOURER'S COTTAGE AT GALWAY to cost £80. Premium £5. Particulars from J. Redington, secretary, Urban District Council, Galway. (See advt. on p. xxiii. of this issue.)
Sept. 11	COTTAGE HOMES AT CLEADON and receiving house at workhouse, for Guardians of South Shields Union. Particulars from J. W. Coulson, Union Offices, South Shields.
Sept. 20	SCHOOL AT SUNDERLAND. Limited to local architects. Premiums of £50, £20 and £10. Particulars from John W. Moncur, borough engineer, Town Hall, Sunderland.
Sept. 21	CONVALESCENT & NURSES' HOME AT GLOSSOP. Premiums of £20 & £10. Particulars from Mr. T. W. Ellison, Town Clerk, Norfolk Chambers, Glossop.
Sept. 28	SEWAGE DISPOSAL SCHEME FOR ELLESMERE. Premium of £20. Particulars from R. E. Lloyd, clerk to Urban District Council, Ellesmere.
Sept. 29	REBUILDING OF HENSHAW'S BLIND ASYLUM AT MANCHESTER. Limited to Manchester architects. Premiums £100, £50 and £25. Assessor, Mr. John Holden, F.R.I.B.A.
Oct. 1	ALPHABET COMPETITION. Prizes of £20, £10 and £5. For particulars see "Architectural Review."
Oct. 31	BOURSE AT CAIRO.—Premiums of £E250 and £E100. International competition. Designs to be submitted to the "Corporation des Agents de Change," Cairo, Egypt.
Dec. 14	FOUNDLING HOSPITAL, MONTEVIDEO.—Four selected designs in preliminary competition to be awarded £212 each; first premium of £742 in final competition. Particulars from Consulate-General for Uruguay, 5 & 6, Clement's Inn, London, W.C.

Correspondence.

The London County Council Hall.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I write as I think it mischievous that letters such as Mr. Bonner's should remain unchallenged, however little those who know anything about the subject may consider them to be worth.

Many errors occur in competitive awards, and many mistakes have been made in the selection of competitors for limited competitions, but I am not aware that there is a single case where the Council of the Institute could be accused of perpetrating a job as Mr. Bonner seems to suggest.

Personally, I believe that limited competitions are usually a mistake—that if one is to have competition at all it should be quite open, because one never knows whether an absolutely unknown man may not in any given case produce the best design, and because circumstances tend to help the man whose reputation is made more than the man who has yet to make his reputation. Mr. Bonner does not seem to remember that most competitions are international, and I think reasonably so. If a foreigner can (in spite of the disadvantage he suffers by his greater difficulty in arriving at what is wanted) win an English competition, I think it is best for everyone that he should do so. Let London have the best that the whole world can give: the odds are that it will prove to be an English design.

I should certainly think it more satisfactory all round if the nominated architects had to compete in both competitions, but Mr. Bonner knows perfectly well when a second competition is instituted that none but the assessors (and perhaps a committee) see the designs first submitted. It is a deliberately unworthy attempt to prejudice the issue to suggest that any unfairness is probable in such a case.

The proposed method of assessing is, in my opinion, satisfactory, and I am glad to see it as a recognition of what I believe to be the best method of settling competitions—the adoption of the jury system.

I would, in conclusion, suggest that Mr. Bonner should consider the inner meaning of the saying: *Honi soit qui mal y pense.*—Yours truly,

LONDON. HERBERT W. WILLS.

Standard Colour Card Competition.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—We would avail ourselves of your columns to thank the very large number of painters, decorators, architects, surveyors and other colour experts who have so well supported and assisted us in our endeavour to establish a universally recognised Colour Standard.

We are glad to be able to say that the vast majority of those engaged in the above professions have entered the competition, and have so become personally responsible for the resulting Standard Colour Card, which will, as a consequence, be thoroughly representative of colour ideas in this country.

It will take some time to arrive at the result, because it entails the careful examination of many thousands of specimens. In due course, however, we will issue copies of the Standard Colour Card to all those who have so kindly assisted us to this end.—Yours truly,

PINCHIN, JOHNSON & CO., LTD.
23-25 BILLITER STREET, E.C.

ARCHITECTURAL DEGREES.

The London B.A.

There has recently been instituted by the Senate of London University a course, extending over three years, leading to the degree of B.A. (honours in architecture). This course provides the opportunity, which has long been needed in London, by which architectural students can continue their general studies at the same time as they are commencing their professional work. A sound general education is now more than ever a necessity for architects, owing to the increasing number of practical subjects with which they require to be acquainted. The course also brings architectural students into touch with students in other departments of the College, who are pursuing different branches of work.

The Royal Institute of British Architects exempt from their Intermediate examination students who receive a first-class certificate of the College.

Students matriculating in September can enter on their courses in October.

A detailed prospectus of the school (which is under the direction of Professor Simpson, with Mr. Reginald Blomfield and Mr. Leonard Stokes as visitors) can be had on application to the secretary, University College, London.

Liverpool School of Architecture.

A syllabus of the School of Architecture at the University of Liverpool for the session 1906-7 has recently been issued. The school is under the direction of Professor C. H. Reilly, M.A., A.R.I.B.A., Mr. B. M. Ward, A.R.I.B.A., being lecturer on Architecture, Mr. G. Gilbert Scott reader on Ecclesiastical Architecture, Mr. C. J. Allen (Liverpool School of Art) instructor in Modelling; Prof. R. J. Harvey Gibson, M.A., and Mr. F. J. Lewis, B.Sc., instructors on Diseases of Timber; and Mr. H. J. Whitby, A.R.San.I., demonstrator on Building Materials. The next term begins on October 9th.

The school is one of those recognised by the Board of Architectural Education, and its courses meet all the requirements of the scheme propounded by the Board; indeed, in some ways this school may be said to have anticipated by more than ten years the scheme advocated by the Board. The school is terminally inspected by visitors representing the Board; the inspectors appointed being Mr. John Slater and Mr. Mervyn Macartney. Students who obtain a degree in the school or a first-class certificate are exempted by the Royal Institute from the Intermediate examination for Associateship. The Royal Academy also exempts such students from probationary work before entering their School of Architecture (the next term at which begins on October 1st).

The degree at present awarded is the degree of B.A. in the Honours School of Architecture, but there is under consideration a revised scheme of degrees.

Architectural Association School.

The next term at the Architectural Association School of Architecture commences October 1st, ending December 22nd. This is a very excellent school, conducted on most efficient lines. Mr. H. P. G. Maule, F.R.I.B.A., is the master. There is a day school and an evening school, full particulars of each of which are given in the syllabus to be obtained from the offices of the Association, 18, Tufton Street, Westminster.

Trade and Craft.

Enamels.

"Japanol" is one of the well-known enamels which are now so extensively coming into use and supplanting in great part the old paints so dearly beloved by the journeyman painter or the local decorator. The improper mixture of paint by people who know nothing about the chemistry of the subject naturally leads continually to trouble, and it may therefore be considered a distinct advance to be able to obtain paints ready mixed, supplied by reputable manufacturers, so that uniform and satisfactory results may be expected. "Japanol" requires no varnish, and it is supplied ready for use without any admixture of turps being required—in fact, turps should not be added. "Japanol" is applied in the same manner as ordinary paint after suitable priming. It is claimed that one coat is equal to three of ordinary paint and varnish. "Japanol" is suitable for outside and inside work, and it has no tendency to blister or crack. There is an immense number of shades in which it is supplied, and any special shade can be obtained if desired at short notice. Ten prize medals and diplomas have been awarded to "Japanol," so that it can be relied upon as an excellent preparation. The Cheap Wood Co., of Deptford Green, London, S.E., who supply "Japanol," also make a speciality of high-class varnishes, japans, dryers, paints and colours.

Glazed Bricks.

Messrs. Stanley Bros., Ltd., of Nuneaton, have recently issued a small pamphlet giving particulars of a few of the latest important contracts where their glazed bricks have been used. The buildings mentioned show that this firm's bricks are favoured by the leading architects and contractors of to-day, and those who have experience of the firm's productions will, we are sure, readily admit their uniformity of excellence in respect of richness of colour and evenness of glaze. The manufacture of glazed bricks is difficult, as shown by the fact that there are very few reliable glazed bricks on the market. In the glazed-brick trade it seems that the very cheap are necessarily nasty. Although this firm is chiefly known for its glazed bricks, it also specialises in semi-encaustic paving tiles, ornamental ridges and finials, red and buff chimney pots, glazed socket pipes, Staffordshire quarries, roofing-tiles, &c.

Drawing Instruments, Materials, &c.

We have just received a copy of a new catalogue of drawing and surveying materials, &c., from the well-known drawing office stationers, Messrs. Norton & Gregory, Ltd., of Castle Lane, Buckingham Gate, London, S.W. This embodies one or two special features. It is divided into sections which are easily turned up, so that any item required can be more or less located without reference to the index: and the strong binding is quite exceptional. In the matter of drawing instruments it is one of the greatest mistakes to put up with anything but the best quality. The loss of time, annoyance, and spoilt work caused by inferior instruments is familiar to everyone who has to make use of them extensively. Messrs. Norton & Gregory bring to this subject a wide experience, and anyone wishing to acquire sets of instruments suitable for all purposes likely to be generally required could not do better than consult specialists such as this firm. We know that it is often considered by those who have to use instruments that they are better judges than the firms who sell them, but this is a mistake. The specialists not only have experience, but they also receive suggestions and criticism from very many users, so that they are far better able to appreciate the good points than the individual user. It is, therefore, important that purchasers should go to those who have the reputation for supplying good instruments.

Watertight Flat Roofs.

In the past, of course, it was a distinctive feature of English architecture and of the architecture of northern countries that the roofs were pointed in order to secure watertightness, but modern architecture makes increasing use of the flat roof, the advantages of which are obvious. English Renaissance, too, calls for the flat roof. The use of mansards behind the parapets, besides being expensive, always seems somewhat incongruous and leads to the adoption of expedients which are a constant source of trouble and annoyance. Of course, with a flat roof there is the difficulty of making it watertight, but this difficulty has now been successfully overcome, and such roofs can be made perfectly satisfactory in this respect. Vulcanite roofing is one of the forms extensively adopted to-day. Its great advantage is that the prime cost is even less than for slated or tiled roofs, and it requires little or no repairs. It is not affected by climatic influences, and has been used in very many countries where extremes of heat and cold are experienced. The temperature under Vulcanite roofing is equable. The material which forms the waterproof surface is a bituminous, horn-like and elastic substance. This material is covered with a layer of gravel or soil, which protects it from the sparks of burning material in the case of fire. As the material is isolated from the boarding, no warping or shrinking can affect it. It will give with any slight settlement and will also withstand the expansion and contraction in steel and concrete, and the vibration from machinery, &c. The catalogue issued by Messrs. Vulcanite, Ltd., of 118, Cannon Street, London, E.C., contains a number of illustrations of buildings where Vulcanite roofs have been used, and also specimen specification clauses, testimonials, and diagrams illustrating the construction of Vulcanite roofs. The illustrations show a somewhat remarkable adaptation of Vulcanite—namely, for the construction of timber roof tanks which carry water to the weight of 100 tons or more. There are few, if any, other similar materials that could contain water on the top of a building in this way without risk of leakage. At the Royal London Friendly Society's premises in Finsbury Square Mr. John Belcher, A.R.A., used a roof tank containing water to the depth of 5½ft. waterproofed with Vulcanite. An official fire test was carried out by the British Fire Prevention Committee showing the relative fire-resisting qualities of a Vulcanite roof and an ordinary slated roof. The temperature ranged from 800° to 1,650° Fahr., and the test was continued for one hour. The Vulcanite roof remained intact and stood being jumped upon.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, *Great New Street, Fetter Lane, E.C.*

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Acton.—For the erection of new magistrates' courts, for the Middlesex County Council. Mr. H. T. Wakelam, county architect, Middlesex Guildhall, Westminster.

County Engineer's estimate, £1,800.

New Buildings for the Sandroyd Schools at Cobham have been erected from designs by Mr. Leonard Martin, F.R.I.B.A., of Cobham, a member of the firm of Messrs. Treadwell & Martin, of London. The buildings are of local red bricks, rough-cast and sand-faced. The roofs are tiled. The builders were Messrs. Martin, Wells & Co., of Aldershot.

Glazing.—Messrs. Mellowes & Co., Ltd., of Corporation Street, Sheffield, have recently been favoured with orders for glazing, on their "Eclipse" Patent Imperishable System, the roofs of :—Messrs. Powell Duffryn Steam Coal Co., Ltd., Aberdare; Beardmore & Co., Ltd., Glasgow; Cammell, Laird & Co., Ltd., Sheffield; Tranmere Bay Development Co., Ltd., Birkenhead; Atherton & Walkden Car Sheds; and Dukinfield Wagon Shops, Great Central Railway.

Complete List of Contracts Open.

WITH a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

August 24. Belfast.—*Construction of the following works* for the Cemetery and Parks Committee: (*a*) Wooden bridge and (*b*) shelter in Victoria Park. (*c*) Plant house and (*d*) forcing pits in Ormeau Park. (*e*) Shelter in Botanic Gardens Park. Plans and specification may be seen and forms of tender obtained in the City Surveyor's Office. Separate sealed tenders, endorsed "Tender for (as the case may be)," to be lodged with S. Black, town clerk, not later than 10 a.m. on August 24.

August 24. Treherbert.—*Alterations and extensions at the Dunraven Council School, Treherbert*, for the Rhondda Urban District Council. Plans and specification may be seen and bills of quantities obtained at the office of J. Rees, architect, Hillside, Pentre, on the deposit of £2 2s. with the Accountant at the Council Offices, Pentre. Sealed tenders, endorsed "Tender for Dunraven School Extensions," accompanied by the priced quantities under separate cover, must reach T. W. Berry, director of Education Council Offices, Pentre, Rhondda, not later than the first post on August 24.

August 25. Swindon.—*Erection of schoolroom for Primitive Methodist trustees*, Upper Stratton, Swindon. Specifications and plans are deposited with S. Fry, 152, Cricklade Road, Swindon. Sealed tenders to be sent to M. Ford, the Farm, Upper Stratton, Swindon, not later than August 25.

August 25. Edinburgh.—*Additions to the Royal Victoria Hospital for Consumption, Edinburgh.* Applications for schedules must be lodged with Sydney Mitchell & Wilson, architects, 13, Young Street, Edinburgh. Schedules will be forwarded as soon as they are ready, and tenders must be lodged with the architects not later than August 25.

August 25. Bradford.—*Alterations, general repairs, painting, &c., at the Bradford Council School* for the Devon County Education Committee. The drawings and specification can be seen, and forms of tender obtained, at the School between the hours of 9.30 a.m. and 5 p.m. Tenders must reach the Architect, 1, Richmond Road, Exeter, not later than the first post on August 25.

August 25. Blaenawynfi.—*Erection of a new Mission Room* at Blaengwynfi for the Rev. John Williams and members. Plans and specifications may be seen with W. Lewis, Commercial Street, Abergwynfi, and of Evans & Jones, architects and surveyors, 4, Trinity Place, Swansea, where quantities may be obtained on deposit of £1 1s. Sealed tenders, to be endorsed "Mission Room" to be delivered to W. Lewis not later than August 25.

August 25. Abergavenny.—*Making additions and extensive improvements to the Cardiff Arms, Abergavenny: also for the building of new stores, stabling, and other works for the Hereford and Tredegar Brewery Co., Ltd., Hereford.* Plans and specifications may be seen and further particulars and forms of tender obtained of B, J. Francis, architect, Abergavenny. Tenders, sealed and endorsed, to be sent to the architect not later than August 25.

August 25. Newport.—*Additions and alterations* for the Isle of Wight County Education Committee at the Technical Institute, Newport. Plans and specifications may be seen at the County Education Offices, Newport, I.W., or at the office of the architect, 5, St. Thomas's Street, Ryde, I.W., where all information may be obtained. Sealed tenders, endorsed "Technical Institute," must reach F. G. Flux, County Education Offices, Newport, I.W., on or before August 25.

August 25. Bangour.—*Construction of the unloading shed* at Bangour Village Station, for the Edinburgh District Lunacy Board. The relative schedule may be obtained on application to H. J. Blanc, R.S.A., architect, 25, Rutland Square, Edinburgh, where specification, general conditions of contract, &c., will be exhibited. The schedules shall be priced, extended, and lodged with J. Kyd, clerk and treasurer, District Lunacy Board Offices, Castle Terrace, Edinburgh, not later than August 25 at 10 a.m., along with the tender.

August 27. Durham.—*Joiner work in connection with the conversion of the Straw-house in the Upper Yard into a 3-stalled stable.* Plans may be seen and specifications had on application to J. T. Pegge, city surveyor, 60, Saddler Street, Durham. Tenders to be delivered by noon August 27.

August 27. Leeds.—*Alterations and additions to Pool School* for the Managers. Persons desirous of tendering for the whole of the trades required in the above work are requested to send in their names to G. W. Atkinson, Architect, 1, Mark Lane, Leeds, before August 27, after which date quantities will be forwarded to him.

August 27. Middlewich.—*Alterations and extensions at No. 2 Branch, Lewin Street, Middlewich*, for the Winsford Industrial Co-operative Society, Ltd. Plans and specifications may be seen at the branch in Middlewich. Tenders, endorsed "Branch Alterations." to be sent in to W. Fryer, secretary, not later than 12 noon on August 27.

August 27. Hawthorn.—*Erection of a Mission Hall* at Hawthorn, Pontypridd, for the Trustees of the English Baptist Church. Plans and specification may be seen of A. LL. Thomas, A.M.I.M.E., architect and engineer, Church Street Chambers, Pontypridd. Tenders to be sent to the Rev. E. Lewis, 89 Wood Road, Pontypridd, by August 27.

August 27. Ashton-on-Ribble, Preston.—*New church.* Contractors desirous of submitting tenders for the whole or separate trades may see the plans, &c., at the office of Austin & Paley, architects, Lancaster. Bills of quantities may be obtained on application to Wright & Son, surveyors, Lancaster. Tenders to be delivered (under cover) to the Architects not later than noon, August 27.

August 27. Hockley.—*Erection of scattered homes at Hockley*, for the Guardians of the Rochford Union. Plans and specifications may be seen at the office of Greenhalgh & Brockbank, architects, in Southend, any day between the hours of 10 a.m. and 4 p.m. The person whose tender is accepted will be required to enter into a contract and find a surety (who must be approved by the Guardians) to be jointly liable with the contractor for the due performance of the work. Tenders must be delivered to F. Gregson, clerk, Southend-on-Sea, on or before August 27.

August 27. Knotty Ash.—*Erection at Highfield Infirmary, Knotty Ash, of laundry buildings*, according to plans and specifications, to be seen at the office of E. Kirby and W. E. Willink, architects, 5, Cook Street, Liverpool, between the hours of 10 o'clock a.m. and 5 o'clock p.m. Bills of quantities, conditions of contract, and forms of tender (upon which alone offers will be received) may be obtained at 5, Cook Street, on payment of a deposit of £2. Sealed tenders must be delivered to H. J. Hagger, vestry clerk, Parish Offices, Brownlow Hill, not later than August 27.

August 28. Pontycymmer.—*Erection of school hall* at Pontycymmer for the English Calvinistic Methodist Church; plans and specifications may be seen with O. Jones, 16, Meadow Street, Pontycymmer, or A. Ll. Thomas, A.M.I.M.E., architect and engineer, Church Street Chambers, Pontypridd. Sealed and endorsed, Tenders to be sent O. Jones on or before August 28.

August 28. Eastby, near Skipton.—*Erection of an entrance lodge at the Sanatorium*, Eastby, near Skipton. Contractors desirous of tendering for this work are requested to forward their applications along with a deposit of £1 1s. to F. Holland, engineer and architect to the Board, 11, Parkinson's Chambers, Hustlergate, Bradford (T.N. 1529). Particulars will be forwarded in due course. Drawings and specifications may be seen at the Architect's offices. Sealed tenders, on separate forms of tender supplied, to be endorsed "Eastby," to be sent to G. M. Crowther, clerk to the Guardians, 22, Manor Row, Bradford, not later than 10 a.m. on August 28.

August 28. Romford. — *The erection and completion of one ward for 14 beds, nurses' quarters, convalescent block.* The drawings, specification, and form of contract may be inspected at the offices of F. Whitmore, architect, 73, Duke Street, Chelmsford, between the hours of ten and five o'clock on any working day except Saturday. Builders desirous of tendering must send at once their names and addresses to the architect, enclosing a deposit of £5, when a copy of bill of quantities and form of tender will be sent. The contractor may be required to give a bond in the sum of £250 as security for the due performance of the contract. Any tender accepted must be subject to the approval of the Local Government Board. Sealed tenders, endorsed "Tender for Extension Isolation Hospital," must be sent to W. Smith, clerk, North Street, Romford, on or before August 28.

August 29. Glasgow.—*Proposed alterations to Whitevale Depôt.* The whole work will be let in one contract, and includes brick, cast iron and steel, carpenter and joiner, slater, plumber, and painter works. Each offerer must submit, along with his tender, a list of the sub-contractors he would propose to employ. Plans can be seen, and forms of tender obtained, on application to J. Dalrymple, general manager, 46, Bath Street, Glasgow. Tenders, marked "Tramways—Tender for Alterations to Whitevale Depôt," must be lodged with A. W. Myles, town clerk, City Chambers, Glasgow, not later than 10 a.m. on August 29.

August 30. Grimsby.—*Erection of proposed new buildings*, Humber Bank, N. Fish Docks, for J. Bygrave, Ltd. Plans, specifications, form of tender, and all particulars may be obtained at the office of their architect, H. Heap, Assoc.M.Inst.C.E., architect and surveyor, Osborne Chambers, between the hours of 9 a.m. and 6 p.m. Sealed tenders, which must be endorsed "Tender for Proposed New Buildings," and addressed to J. Bygrave, Ltd., must be delivered at their premises, Fish Dock Road, Grimsby not later than August 30.

August 31. Cwm.—*Erecting a Fire Station at Cwm* for the Ebbw Vale Urban District Council. Plan and specification may be seen and form of tender, with bill of quantities, obtained by appointment at the office of T. J. Thomas, town surveyor. A deposit of 10s., which must be in postal orders, will be required from each person who obtains a copy of the form of tender. Tender, enclosed in a sealed envelope, endorsed on the outside "Tender for Fire Station at Cwm," should be delivered to T. Hughes, clerk, Ebbw Vale, not later than August 31.

August 31. New Malden.—*Building a boundary wall, erecting wood and iron fencing and forming a path at Norbiton Common Farm, New Malden*, Surrey, in accordance with plans prepared by W. H. Hope, C.E., architect and surveyor, Hampton Wick. The drawings may be seen and a copy of the specification and form of tender obtained on application to J. Edgell, clerk to the Guardians, Union Offices (opposite Norbiton Railway Station), Kingston-on-Thames, between the hours of 9 a.m. and 4 p.m. and until 1 p.m. on Saturdays. Fair wages clause. Tenders to be delivered to J. Edgell not later than August 31.

August 31. Mirfield.—*Alterations and additions to the Mirfield Grammar School.* Intending contractors may see the plans and specifications and obtain bills of quantities at the offices of the Architect, No. 4, Oxford Place, Leeds. Sealed tenders are to be sent in, not later than 4 p.m., addressed to G. Topham, solicitor, Mirfield, not later than August 31.

Sept. 3. Fife. — *Erection of joint infectious diseases hospital* near St. Michael's, Leuchars, Fife. Applications for schedules must be lodged with W. Carruthers Laidlaw, architect, 4, York Buildings, Edinburgh, from whom schedules can be obtained on payment of a deposit of £1. All tenders must be lodged with the architect not later than Sept. 3.

Sept 3. Stourton.—*Providing and erecting a wood and iron fencing* round the new sewage disposal works at Stourton, for the Rothwell Urban District Council. Plans and specfication can be seen and particulars obtained at theoffices of E. J. Silcock, M.I.C.E., engineer, 10 Park Row, Leeds. Sealed tenders, endorsed "Stourton Fencing" must be delivered to W. Dodgson, clerk to the Council, Council Offices, Rothwell, near Leeds, not later than noon Sept. 3.

September 3. Castleblayney.—*Erection of a goods store (90ft. × 25ft.) and Office (20ft. × 14ft.)* of timber, with galvanised corrugated iron roof, &c., at their Castleblaney Station, for the Directors of the Great Northern Ry. Co (Ireland). Parties wishing to tender may see the drawing and specification at the office of W. H. Mills, Engineer-in-Chief, Amiens Street Terminus, Dublin, or copies of them at the office of the District Engineer, Belfast, and forms of tender can be obtained at either of the said offices on payment of 1s. each. Tenders made out on the forms supplied by the Company, and endorsed "Tender for Goods Store," should be delivered to T. Morrison (Secretary), Secretary's Office, Amiens Street Terminus, Dublin, not later than 10 a.m. on Sept. 3.

Sept. 3. Ballycastle.—*Erection of the following cottages*, for the Rural District Council, upon the several sites shown on the deposited plans in the following townlands:—Double cottage in the townland of Maghernahar; double cottage in the townland of Toberkeagh; double cottage in the townland of Ballycleagh; double cottage in the townland of Moycraig Lower; double cottage in the townland of Ballypatrick; double cottage in the townland of East Torr; double cottage in the townland of Eglish; block of three cottages in the townland of Coolkenny; block of four cottages in the townland of Capecastle; block of four cottages in the townland of Coolnagoppoge: block of four cottages in the townland of Townparks; block of six cottages in the townland of Drumawillin. The contractor can be put into possession of the sites immediately after the execution of the contract. The deposited maps and the plans, specifications, and draft contract may be inspected in the office of H. M'Gill, clerk of the Ballycastle Rural District Council, Boardroom, Ballycastle, from 10 a.m. to 4 p.m. each day by intending contractors. Tenders must be upon the prescribed form (which can be obtained at the above office) and in strict conformity with the specification, and must be sealed and addresed to the presiding chairman, Ballycastle Rural District Council, and marked "Tender for Cottages," and must be received by H. M'Gill not later than 3 p.m. on September 3. The names and addresses of two solvent sureties must accompany each tender. Separate tenders must be sent in for the erection of each block of cottages.

Sept. 4. Lochmaben.—*Erection of the Lochmaben Combination Hospital* for the Board of Directors. Plans may be seen with, and schedules obtained from F. Carruthers, Esq., architect, 35, Buccleuch Street, Dumfries, on payment of £1 1s. Mr. Carruthers will meet intending contractors at the Town Hall, Lochmaben, on August 28, between the hours of 11 a.m. and 3 p.m.; and all tenders must be lodged with John Ford Cormack, solicitor, Lockerbie, clerk to the Combination, on or before September 4.

Sept. 4. London, W.—*Execution of ordinary works and repairs to buildings, &c.*, in the charge of the Commissioners of His Majesty's Works and Public Buildings in the London district for three and a half years from October 1, 1906. The printed schedule, with form of tender, may be obtained at His Majesty's Office of Works, Storey's Gate, Westminster, between the hours of 11 a.m. and 5 p.m., upon payment of £1. Tenders must be delivered before 12 o'clock noon on Sept. 4, addressed to the Secretary, H.M. Office of Works, Storey's Gate, London, S.W., and endorsed "Tender for Ordinary Works and Repairs, London."

Sept. 4. Blackrock.—*Works in connection with the New Assembly Room, Town Hall, Blackrock*, for the Urban District Council. (a) Overhauling and repairing roof, (b) erection of gas fittings, (c) extension and repair of present ceiling, (d) relaying of present floor, (e) decorating and painting walls, &c. Tenders for each of the several works to be on separate forms. Specifications can be seen and full particulars obtained at the Surveyor's office, Town Hall, Blackrock. Materials must be, as far as possible, of Irish manufacture. Fair wages clause. Tenders (which are to be on prescribed forms) must be lodged with R. F. Heron, town clerk, Town Hall, Blackrock, Co. Dublin, on or before four o'clock p.m. on September 4.

Sept. 4. Maidstone.—*New Police Station on land adjoining Mill Street.* Applications for bills of quantities and form of tender to be made at the offices of Ruck and Smith, architects, 86, Week Street, Maidstone, where plans and specification may be seen on or before August 27, after which date no application can be entertained. A copy of the quantities and form of tender will be supplied to those who have made application, in exchange for £2 2s. Sealed tenders, which will only be received on the form supplied, to be sent to S. L. Monckton. Town Clerk's Office, King Street, Maidstone, endorsed "Tender for new Police Station," on or before noon on September 4. Should any tender be accepted, it will be on condition that the sanction of the Local Government Board is given to the necessary loan for cayrying out the scheme.

Sept. 5. Manchester. — *Erection of the Domett Street Municipal School, Blackley, Manchester.* Plans may be seen and a copy of the bills of quantities (including specification) may be obtained at the Education Offices, Deansgate, Manchester, on a deposit of £2 2s. Tenders, on the official forms, and enclosed in the envelopes provided, must be delivered not later than September 5. Cheques to be made payable to the Accountant, Education Offices, Deansgate, Manchester.

Sept. 5. Manchester.—*Alterations and additions to the Abbott Street Municipal School, Rochdale Road, Manchester.* Plans may be seen and a copy of the bill of quantities (including specification) may be obtained at the Education Offices, Deansgate, Manchester, on a deposit of £2 2s. Tenders, on the official forms and enclosed in the envelopes provided, must be delivered not later than Sept. 5. Cheques to be made payable to the Accountant, Education Offices, Deansgate, Manchester.

Sept. 8. Derby.—*Erection of a new school* on a site between Clarence and Porter Roads. Plans, specfications, and conditions of contract may be seen and schedules of quantities may be obtained, on application to Hunter and Woodhouse, All Saints' Chambers, Iron Gate, Derby. The sum of £1 1s. will be charged for the schedule of quantities. Tenders on the form supplied, together with the priced schedule of quantities, must be delivered at the Education Office, Becket Street, Derby, before 12 o'clock at noon on Sept 8, endorsed "Tender for New School on Clarence Road." Fair wages clauses. Tenders will be accepted from Derby firms only.

September 10. Salford.—*Extensions to car depot and workshops* for the Tramways Committee. Contract 145, constructional steelwork; contract 146, builders' work, in their erection and completion of extensions to the Central Car Depot, Frederick Road, Pendleton. Forms of tender and bills of quantities for either contract may be obtained on application to the General Manager, Tramways Department, 32, Blackfriars Street, Salford, upon depositing a cheque for £2 2s. Plans can be inspected and further particulars obtained at the above-mentioned offices. Tenders endorsed "Steelwork" (or "Buiders' Work" as the case may be) "Car Depot Extensions," and addressed to the Chairman, Tramways Committee, Town Hall, Salford, must be delivered to L. C. Evans, town clerk, Town Hall, Salford, not later than 3 p.m. on September 10.

Sept. 11. Manchester.—*Execution of Alterations at the Benton Technical Institute* for the Lancs. Education Committee. The plans may be seen and bills of quantities obtained at the offices of J. W. Beaumont & Son, 10, St. James's Square, Manchester. Tenders must be delivered before 12 o'clock noon on September 11, sealed and endorsed, to W. F. Knott. Parish Offices, Ashton-under-Lyne.

Sept. 11. Audenshaw.—*Erection of a new public elementary school* at Audenshaw. The plans may be seen and bills of quantities obtained at the office of Henry Littler, county architect, 16, Ribblesdale Place, Preston, by payment of a deposit of £2. Tenders must be delivered before 12 o'clock noon on September 11, sealed and endorsed, to W. F. Knott, Parish Offices, Ashton-under-Lyne.

Sept. 12. Merthyr Tydfil.—*Additions and improvements* to Bethesda Congregational Chapel, Merthyr Tydfil. The plans and specifications can be seen with Mr. Rees Jones, grocer, Bethesda Street. The tenders to be sent, sealed and endorsed, to J. Thomas, 90, Brecon Road, Merthyr Tydfil, not later than September 12.

Sept. 27. London, E. — *Additions and alterations in the building at the Electricity Works*, Osborn Street, Whitechapel, E., Persons tendering must submit the names and addresses of two substantial persons willing to be jointly and severally bound for the due and proper performance of the contract. Fair wages clause. The drawings may be seen and copies of the stipulations, specification, schedule, and form of tender may be obtained by applying to M. W Jameson, A.M.Inst.C.E., borough engineer, 15, Great Alie Street, Whitechapel, E., between the hours of 10 a.m. and 12 noon, upon paying £5. Tenders, endorsed "Tenders for Additions to Electricity Buildings," should be sent to G. W. Clarke, town clerk, 15, Great Alie Street, Whitechapel. E., in the envelopes supplied, so as arrive at this office on before 12 o'clock noon on September 27.

No date. Billericay.—*Additions and alterations to the workhouse of Billericay Union, also for the erection of new receiving wards.* Builders desirous of tendering must send in their names and addresses to Walter J. Wood, architect, 26, Alexander Street, Southend-on-Sea. and 1, Finsbury Circus, London, E.C., with a deposit of £1 1s., when a copy of the bill of quantities and form of tender will be forwarded as soon as same are ready. The builder whose tender is accepted will be required to enter into a contract and give a bond with two approved sureties for the due performance of the terms thereof. In sending in their names to the architects, builders must also give two references as to recent work carried out. Any tender accepted will be subject to the approval of the Local Government Board. The plans and specifications can be seen at the workhouse, Billericay, or the architect's office, at Southend-on-Sea, after the quantities have been sent out, between the hours of 10 a.m. and 5 p.m. The date by which tenders must be sent in will be announced in the form of tender.

No date. Kendal. — *Building an Infants' Sunday School* in Highgate, Kendal, for the Trustees of Zion Chapel. Plans can now be inspected and names of intending contractors for bills of quantities received of J. Hutton, M.R.S.I., architect, Kendal. Tenders to be sent in to him on the date specified on quantities.

ENGINEERING.

Sealed tenders must be delivered at the said offies not later than 5 p.m. on August 27.

Sept. 10. Bishop's Stortford.—*Supply and delivery of a 10-ton steam road-roller* for the Urban District Council. Tenders, accompanied by a complete specification of the roller proposed to be supplied, and stating when it can be delivered, to be sent to T. Swatheridge, clerk, Council Offices, 7, North Street, Bishop's Stortford, by Sept. 10.

SANITARY.

August 24. Birmingham.—*Reconstruction of a length of about 45½yds. of 3-ft. 6-in. brick barrel sewer and about 27yds. of 3-ft. 6-in. by 2-ft. 6-in., egg-shaped sewer, together with manholes, Junction, Bellmouth, and other incidental works*, for the Public Works Committee. The plans and specification may be seen, and quantities and forms of tender obtained, on deposit of a sum of £2. Fair wages clause. Tenders, sealed and endorsed "Sandy Lane Sewer," and addressed to the Chairman of the Public Works Committee, must be delivered to H. E. Stilgoe, City engineer and surveyor, the Council House, Birmingham, not later than August 24.

August 25. Stansted.—*Provision, laying, and jointing about 641 yards of 9-in. stoneware sewer and about 1,254 yards of 6-in., together with all all manholes and lampholes*, for the Rural District Council, in accordance with the plans, sections, and detailed drawings prepared by the Surveyor. Plans and specifications may be seen at the Central Hall, Stansted, Essex, and further particulars to be obtained from E. J. Watts, surveyor, Thorley, Bishop's Stortford. Sealed tenders, endorsed "Stansted Sewers," to be delivered to A. G. Gwynn, Central Offices, North Street, Bishop's Stortford, not later than 12 o'clock noon on August 25.

August 27. Cowdenbeath.—*Additional drainage works* within the Burgh. Plans and sections of the works may be seen, or copies of specifications and schedules of measurement may be obtained at the office of Buchan & Bennett, C.E., 12, Hill Street, Edinburgh; and assistant engineers will meet any intending offerers at Cowdenbeath Railway Station on August 20, at 10.30 a.m., to point out the lines of the proposed Works. Tenders (marked "Additional Drainage Works") are to be lodged with G. Terris. Town clerk, Cowdenbeath, not later than August 27.

August 28. Morecambe. — *Construction of certain intended stoneware and cast-iron pipe sewers* in connection with the sewerage works of the town of Morecambe, for the Borough Town Council, together with manholes, ventilators, connections, and other works, the whole to be let in one contract. Drawings and specification may be seen at the offices of Beesley, Son & Nicholls, MM.Inst.C E., engineers, of 11, Victoria Street, Westminster, S.W., where also specification, bills of quantities, and forms of tender can be obtained on deposit of £5. Copies of the plans and specification may also be seen at Town Hall, Morecambe. Sealed tenders, addressed to W. Tilly, and endorsed "Sewerage Works, Contract No. 3," are to be delivered at the Town Hall, Morecambe, before 10 a.m. on August 28.

August 28. Leatherhead.—*Widening, reforming, kerbing, and providing and laying 1,423 yards of 12-in. and 9-in. stoneware storm-water drain* in connection with the improvement of a portion of Kingston Main road, for the Urban District Council. Also for the providing and laying of about 300 lineal yards of 9in. diam. sewer, with all necessary manholes, &c., in the Oxshott Road. The drawing and draft contract may be seen and copies of the specification, of tenders, and schedules of work obtained at the office of J. E. Smales, engineer and surveyor, Council Offices, Leatherhead, upon the payment of £3 3s. Tenders, sealed and endorsed "Road Improvement." to be sent, addressed to the Clerk of the Leatherhead Urban District Council, on or before 4 p.m. on August 28.

Sept. 5. Whiston.—*Construction of about 17,390 lineal yards of glazed earthenware and cast-iron pipe sewers* varying in diameter from 15ins to 9ins., together with manholes, lampholes, flushing chambers, sewage tanks, and other incidental works for the Rural District Council. The drawings may be seen and copies of the specification and quantities obtained at the office of John T. Wood, M.Inst.C.E., engineer, 3, Cook Street, Liverpool, on the deposit of £5. Sealed tenders, endorsed "Tender for Sewerage Works," to be delivered to A. F. Mann, at the Union Office, Whiston, Prescot, on or before Sept. 5.

September 6. Surbiton, Surrey.—*Construction of main drainage works* for the Urban District Council, subject to the sanction of the Local Government Board. The drawings, specifications, bills of quantities, and forms of tender, may be inspected at the offices of Nicholson-Lailey, M.Inst.C.E., engineer, 53, Victoria Street, Westminster, between 10 a.m. and 5 p.m. (Saturdays excepted), until September 3. Tenders, sealed and endorsed "Surbiton Main Drainage," are to be addressed to F. J. Bell, deputy clerk, Surbiton Urban District Council Offices, Ewell Road, Surbiton, and delivered on September 6 by 12 o'clock noon. A deposit of £10 Bank of England note will be required.

MISCELLANEOUS.

August 28. Fairfield.—*Construction of a Concrete Storage Reservoir* at Turner Lodge, Fairfield, near Buxton, to hold 4,000,000 gallons. Drawings may be seen, and copy of specification, bill of quantities, and form of tender obtained at the Offices of Swann & Brady, engineers, Town Hall, Chapel-en-le-Frith, *viâ* Stockport, on payment of £2 2s. Sealed tenders endorsed "Tender for Reservoir," to be delivered to C. Slater, at the Council Offices, Fairfield, Derbyshire, on or before August 28.

DURING THE WEEK ending August 17th seventeen failures in the building and timber trades in England and Wales were gazetted.

A. LEVY, builder, Hornsey. Adj. Aug. 10.

H. FOLEY, builder, Reading. R.O., Aug. 10.

G. GUNDEY, plumber, Rotherham. R.O., Aug. 8.

R. E. COLE, contractor, Tottenham. Adj. Aug. 4.

F. SPENCER & SON, builders, Erith. R.O., Aug. 10.

O. ELLIOTT, painter and decorator, Beeston. R.O., Aug. 8.

J. WARD, builder, Stockport. R.O., May 15 (amended notice).

O. ODELL, builder and contractor, Wheathampstead. R O., Aug. 10.

H. ALEXANDER & Co., architects and surveyors, London, E.C. Adj. Aug. 4.

F. RICHARDS, builder, Wolverhampton. Liabilities, £347; deficiency. £54.

G. BARTON, builder, Ashford. P.E., Canterbury Guildhall, Sept. 13, at 10.

G. WILLIAMS, late builder, Blaina. Liabilities, £161; assets, £31; deficiency, £130.

F. A. SIMONS, builders' merchant, Gravelly Hill, Birmingham. Deficiency, £717.

WILKINSON BROTHERS, joiners and builders, Bradford. Gross liabilities, £343; assets, £50.

C. FAIRBANK, builder, Birmingham. Liabilities expected to rank, £1,688; assets, £319; deficiency, £1,369.

R. & G. BRISLEY, builders and contractors, Dover. Liabilities expected to rank, £4,450; deficiency, £3,378.

T. ELLIOTT, house painter, paperhanger and decorator, Newcastle-on-Tyne. P.E., Newcastle C.C., Aug. 23, at 11.

S. Ormerod, builder, Bromley. First meeting, O.R.'s, Leeds, Aug. 22, at 11.30. P.E., Leeds C.C., Aug. 28, at 11.; R.O., Aug. 10.

H. BENNETT, general contractor, Liverpool. First meeting, R.O.'s, Liverpool, Aug. 23, at 11. P.E., Liverpool C.C., Sept. 3, at 11.

P. CARROLL, builder and contractor, Liverpool. First meeting, O.R.'s, Liverpool, Aug. 22, at 2 30. P.E., Liverpool C.C., Sept. 3, at 11.

J. FELL, late builder and contractor, Leamington; now tramway engineer, Westminster. Gross liabilities, £7,300; £3,933 fully secured; assets, £2,914.

W. MANNING, builder, Croydon and Leatherhead. First meeting, 132, York Road, London, S.E., Aug. 23, at 12.30. P.E., Croydon C.C., Oct. 10, at 11. R.O., Aug. 2.

New Companies.

DERBY BRICK CO., LTD., Rowditch, Derby. Capital: £50,000.

MEDWAY CLAY CO., 17, High Street, Rochester. Capital: £3,000.

HOME COUNTIES ELECTRICITY SUPPLY CO., 137, Cannon Street, E.C. Capital: £1,000.

LUSSET LANDS CO., LTD., brick and tile makers, 153, St. Vincent Street, Glasgow. Capital: £10,000

H. R. VAUGHAN & CO., to acquire the business the St. Helens Brickworks, Fylands, Bishop Auckland. Capital: £6,000.

IMPROVED PAVEMENT LIGHT CO., to acquire patents in pavement, floor and road lights, and in prisms used therefor, granted to W. J. Hooks, W. H. C. Hammond, and B. W. Donkin. Capital: £12,000.

FLETTON CROWN AND CROWHURST BRICK CO., LTD., to acquire the assets of the Fletton Crown Brickworks, Ltd., and the London and Brighton Brick, Tile and Terra-Cotta Co., Ltd., and to carry on the business indicated by title. Capital: £31,500.

LOCKERBIE & WILKINSON (Birmingham), to adopt an agreement with R. Duncan, W. D. Green and D. Green, to acquire the business of Lockerbie & Wilkinson, Limited, and to carry on the business of factors of and dealers in iron, brass and metal work, hardware, &c. Capital: £15,000.

MORLEY, FOX & CO., to acquire the business carried on by the trustees of the late W. Morley at the Salopian Works, Fenton, Staffs, as William Morley; to adopt an agreement with Ellen Lloyd and others; and to carry on the business of manufacturers of bricks, tiles, pipes, etc. Capital: £15,000.

J. KIRKALDY & SON, to acquire the business carried on at Garford Street, West India Dock Road, E., and elsewhere, as John Kirkaldy & Son, to adopt an agreement with T. Kirkaldy, and to carry on the business of manufacturers of paint, varnish, anti-corrosive and anti-fouling compositions, &c. Capital: £25,000.

Partnerships.

Dissolutions of Partnerships.

[The date when the partnership was dissolved is given in parenthesis where known.]

APPLETON & MILLER, builders, Colchester (July 13).

THOMPSON & WARREN, painters and decorators, Derby (July 14).

TAYLOR & MOFFAT, builders and contractors, Hightown. Lancs. (July 27).

W. H. COOPER, builder and contractor, Chevington, Suffolk (May 18).

LEITH. BOLCKOW & CO., iron and steel merchants, Newcastle-on Tyne (June 30). Debts by W. A. Leith.

DICKINSON BROTHERS, painters and decorators, York (July 14). Debts by G. J. Dickinson, who continues with A. Dickinson.

L. H. & R. ROBERTS, builders, Islington (June 30 as regards L. H. Roberts). Debts by R. Roberts and R. L. Roberts, who continue.

ELMORE & SON, builders and contractors, Maidstone (July 9 as regards W. R. Billinness). Debts by T. A. Elmore and E. G. Carpenter, who continue.

TENNANT & BAGLEY, architects and surveyors, Pontefract (July 30). Debts by W. J. Tennant and F. S. Bagley, who continue to practice separately.

A Discovery at Ripon Cathedral.—In the course of certain renovation work on the north side of Ripon Cathedral there has been disclosed what appears to be the foundation of the old Norman cathedral, as the stone exactly corresponds with the stone in the Norman crypt.

A New Castle at Rowallan has been erected from designs by Mr. R. S. Lorimer, of Edinburgh. The stone is of cream colour. The contractors were:—Mason and joiner work, Messrs. Boyd & Forrest, Kilmarnock; plaster work, Stuart's Granolithic Company, Edinburgh; plumber work, Mr. Barton, Edinburgh; painter work, Mr. Duncan, Glasgow; slating, Messrs. R. Graham & Son, Castle Street, Edinburgh; electric lighting, the Alliance Electrical Co., Ltd., 65, Renfield Street, Glasgow.

CONTRACTORS' SUPPLEMENT (MONTHLY).

The Demand from San Francisco. WE have never been particularly optimistic about the opportunities which the San Francisco disaster would give to the English building trades. We have expressed the opinion that, however smart the inhabitants might be, it would be several years before the rebuilding could be concluded, and that the work would be spread over a period which would enable most of the demand to be satisfied by home industry. This opinion is confirmed by the German trade expert in New York, who states that building material, &c., imported from abroad will not enter very largely into the rebuilding of San Francisco, but thinks that just as President Roosevelt refused the monetary assistance proffered from abroad, so will Congress refuse to exempt building materials from import duty. The demand for constructional material, girders, angles, &c., will not be so great as was at first estimated, and supplies will only be required to be brought forward in instalments, which the American iron and steel industry will be able to furnish without difficulty. The more immediate needs—namely, for corrugated iron, wire and nails, &c., for temporary structures—have already been to a large extent satisfied by American concerns. Perhaps a more active demand for fireproof roof and wall coverings and for impregnating material for wood will arise, and bring with it a better chance for the importer. Pressing needs have already been covered, and requirements which will arise with the return to former conditions in the city will be met through the customary channels. The Baltimore fire did not create an abnormal activity in the building materials trade. The demand for Portland cement has, however, already been experienced in this country and in Belgium, as recorded in our special monthly report on the next page. In the opinion of the German trade expert this demand is likely to continue.

Building Accidents. THE recent appointment of a Royal Commission to inquire into accidents in building operations, and the attempt the L.C.C. is making to obtain powers for the control of plant and scaffolding used in the erection of buildings, lends interest to an inquest recently held at the Marylebone Coroner's Court. We would point out that this only shows how accidents are more often than not caused by carelessness on the part of workmen, which legislation can in no wise affect. Of course, accidents do occasionally arise through the use of weak and insecure plant and scaffolding, but it is doubtful if the interference of Government or municipal inspectors would not lead foremen and clerks of works to depend upon these inspectors checking errors, and consequently result in more harm than good. At present, those in charge of building operations know the grave risk of life that may be caused by carelessness, and they consequently pay great attention to the matter. If, however, a lot of bothering and interfering requirements are insisted upon, not only will cost be unnecessarily increased, but, as we suggest, the result may be that there is far less efficiency. The particulars of the case above referred to are as follows:—At the Marylebone Coroner's Court recently an inquest was held on a labourer who died as the result of a fall down a lift shaft. The evidence showed that the deceased, who was in the employment of Messrs. Trollope and Co., builders, of Coleman Street, E.C., was engaged in the rebuilding of Messrs. Debenham and Freebody's premises, Wigmore Street, Cavendish Square. He ascended from the basement to the first floor for the purpose of removing a hose pipe, and whilst doing so the electric lift which was used for the purpose of taking material up and down the buildings descended, striking him on the head. He was knocked down the lift shaft into the basement. The lift attendant admitted that the only signal to give to workmen that the lift was about to move up or down was by his calling out. On Friday he called out as usual, but owing to his having a cold it was possible that his voice did not carry sufficiently far for him to be heard. The jury returned a verdict of "Accidental death," and added a rider calling the attention of Messrs. Trollope & Co. to the fact "that in their opinion the voice signal was not sufficient, and that some other means should be used to give the workmen warning when the lift was about to be used."

Germany and Egypt's Trade. IT will be within the recollection of our readers that some time ago there was an agitation about American firms obtaining contracts for the supply of steel bridges and locomotives to Egypt. It appears, however, that the United States is not our chief competitor in this market. From a recent return, Germany would seem to be much more formidable. The largest proportion of Germany's trade with Egypt is in iron and steel goods, the main branches being rolled steel girders, mild steel bars and hoops and small portable steel rails. In view of the large number of girders imported into Egypt every year, it is to be regretted that England is practically out of the market. The German and Belgian prices considerably undercut English prices, and, in addition, the British standards sections do not suit the market. The following are some of the principal sizes used by builders and contractors in Egypt:—

Height.	Flange.	Web.	Weight per metre.
Millimetres.	Millimetres.	Millimetres.	Kilograms.
80	42 × 42	3.9	6.0
100	50 × 50	4.5	8.3
120	58 × 58	5.1	11.1
140	66 × 66	5.7	14.3
160	74 × 74	6.3	17.9
180	82 × 82	6.9	21.9
200	90 × 90	7.5	26.2
220	98 × 98	8.1	31.0
240	106 × 106	8.7	36.2
260	113 × 113	9.4	41.9
280	119 × 119	10.1	47.9
300	125 × 125	10.8	54.0

The price of the ordinary German rolled steel girders, c.i.f. Alexandria, was, a few weeks ago, about 157·70frs. (£6 4s. 9d.) per ton of 1,000 kilograms. For an order of 2,000 tons, the price is reduced by 1·50frs. (1s. 2d.) a ton. In cast-iron tubing, Germany finds a serious competitor in Belgium, as the latter is able to send over a lighter and cheaper article. Egypt, however, imports large quantities of gas tubes and water piping from Germany, though England has still a good share of this trade. Bar iron from Germany—free on quay Alexandria—costs at present about 166frs. (£6 11s. 4d.) a ton of 1,000 kilos German ironmongery is cheap, and big consignments of tools for carpenters, masons, shoemakers and so on are sent over at very low prices, and, as it is extremely difficult to make the natives understand that a dearer but better made article is the cheaper one in the long run, Birmingham trade has suffered and will suffer in consequence. Cheap locks and hinges of every description, together with nuts, bolts, and window fasteners, all find a good market in Egypt. Speaking generally, the windows in that country are of the French pattern, whilst the doors are also composed of two leaves opening in the centre. The main supplies of hooks and eyes with which they are fitted—in order to keep them open for purposes of ventilation—come from Germany.

The Building Strike at Zurich, one of the longest and most severe that Switzerland has known, has resulted in a complete victory for the masters. After a three months' struggle, which has been a period of great misery for a large number of families, the men have gone back to work unconditionally. The strike has cost the country and the town of Zurich £4,000.

The Emigrants' Information Office desires to warn plumbers intending to go to Canada that information has been received at the Colonial Office to the effect that a strike of plumbers is in progress at Winnipeg, affecting from 175 to 180 men and over thirty establishments. Plumbers intending to go to Canada are advised to communicate with the Emigrants' Information Office, 31 Broadway, Westminster, S.W.

The Month's Trade

Reports by our Special Correspondents.

THE STONE, GRANITE AND MARBLE TRADES.

In these trades some slight improvement has been shown in the past month, except as regards the granite industry, which continued to be very quiet and, if anything, worse than a year ago. The limestone and sandstone quarries were better employed than a month and a year ago. This very small improvement has continued now for a month or two and it appears that the industry may look forward to a gradually improving trade.

The Board of Trade reports for July are as follows:—

Employment in limestone quarries was good, and better than a month and a year ago in Cumberland. It was also good in Weardale, and was fair in South Durham. In the Plymouth district employment was fair generally, and better than a month ago. It continued fair in the Buxton district.

As regards other stone employment was reported as fair, and better than a month ago in the Gateshead district. In the Sheffield, Barnsley and Rotherham district full time was generally worked. Chert quarrymen were well employed in Derbyshire, with much overtime. Employment was fair in the Clee Hill road-material quarries, and moderate in building and limestone quarries in the Rowsley district. It continued bad, with much short time, in Forfarshire.

Employment in granite quarries continued moderate on the whole in Aberdeenshire, but was worse than a year ago. It continued fair in Leicestershire. In Devonshire and Cornwall employment was quiet, but better than a month ago.

Employment with settmakers continued good at Airdrie, Glasgow, Edinburgh and Stoney Stanton, and fair in Aberdeenshire. It was fair, on the whole, in North Wales and in the Clee Hill district. At Rowley Regis it was reported slack through want of stone.

The returns for imports of stones, slabs and marble, rough, hewn and manufactured, for the month of July, 1906, as compared with the same month in 1904 and 1905, are as follows:—

Tons.			Value.		
1904.	1905.	1906.	1904.	1905.	1906.
119,886	110.555	123,053	£136,125	£112,644	£129,118

THE CLAY WORKING INDUSTRY.

We are thankful to be again able to record that the slight improvement noticeable for the last two months continues in the brick and tile trades. Employment, it is true, is still moderate, but it is better than a month ago and a year ago, and it is evident that the trade is at last beginning to revive. The fact that it has been better than last year for the past three months seems to show that the improvement is more than a seasonable one and that the slack time is beginning to pass away and the clay working industry to at last feel the improvement which has been noticeable in various directions in the building trades generally. The districts where things are better are analysed by the Board of Trade, which reports employment as fair on the whole, but that it continued good at Oldham and in South Wales; it was also good in North Wales; in the Tees and Plymouth districts it was fair. In Nottingham, however, employment was slack, short time being worked. At Peterborough an improvement was reported.

THE PORTLAND CEMENT TRADE.

The Portland cement trade continues to prosper. The export trade is flourishing. Altogether there is practically nothing to add this month to our remarks in last month's issue of the "Contractor's Supplement."

The exports for the first seven months have almost reached the yearly totals for 1903, 1904 and 1905. The *Times* recently stated: "Belgium exports annually a considerably larger quantity of cement than Great Britain, the total for 1905 being 679,426 and for 1904 588,295 metric tons. For the first six months of this year the exports amount to 380,556 tons, against 319,770 and 279,154 tons in the corresponding six months of 1905 and 1904 respectively. It is claimed on behalf of the Belgian exporters that by prompt action after the earthquake at San Francisco they secured the lion's share of the newly-created business with that city. But the export figures for the six months to the end of June show that the shipments from Belgium to America fall short of what has been shipped during the same period to the same destination from this country, being 41,332 metric tons, against 49,540 long tons from Great Britain. And whereas the British exports for the six months give an increase over the corresponding six months of last year of 45,735 tons, the Belgian increase on the same comparison is only 16,588 tons. Some estimates, however, place the quantity on order, and yet to be shipped from Belgium during the 12 months ending next March, at about 350,000 tons. The productive capacity of the thirteen syndicated mills in Belgium is about 700,000 tons per annum, and at the present time these mills are turning out a full production. Quite recently, however, producers have shown a disposition to cancel Pacific Coast contracts, fearing that recent heavy shipments will result in a congestion of stocks at San Francisco."

A more comprehensive combine is, it is said, likely to be formed among the Thames and Medway manufacturers with a view to maintaining prices, in order to prevent the industry again relapsing into the condition of depression from which it is now just emerging.

The returns for imports and exports of cement for building and engineering purposes for July, 1906, as compared with the same month in 1904 and 1905 are as follows:—

IMPORTS.

	1904.	1905.	1906.
Tons... ...	22,650	18,435	18,089
Value ...	£32,941	23,436	23,346

EXPORTS.

	1904.	1905.	1906.
Tons... ...	36 147	45,081	60,011
Value ...	£57,327	69,776	90,788

THE SLATE AND TILE TRADES.

Little improvement, if any, in the condition of the slate and tile trades has taken place during the past month. Enquiries for slating are still small in number as well as area, and in the slate trade especially jobs of 100 squares and upwards are still scarce.

Trade in the Northern Counties and North Midlands is fairly good, as also it appears to be in Ireland, but in the London and Home Counties complaints of slackness are general. This does not appear to be confined to general contracts, but applies also to speculative building, and in the latter branch of the trade most of the estates have been built on somewhat in advance of requirements, and operations are being curtailed in consequence.

The wall and floor-tile branch of the trade is in a stagnant condition, and prices extremely low and quite unremunerative.

The slate slab trade is particularly quiet; this is largely accounted for by the general use of earthenware for sanitary purposes, and of late the use of slate as partitions for slipper baths has fallen off in favour of teak and marble. Another important branch—namely, the brewing trade—has been stagnant, and inquiries are very rare.

The slate trade in Wales is gradually improving and it is hoped that stocks may be considerably reduced by the end of the year. Short time is still being worked in some of the districts, and the supply will in the future be regulated. so far as possible, to meet the demand.

The low price of Welsh slates has somewhat curtailed the import of foreign slates.

The quarries in Westmorland report a general quietness in the London area, all the trade in these slates is apparently being done in the north. They are badly wanting a few large contracts, such as the City Hall, Belfast.

The Board of Trade returns show that employment in July in North Wales continued slack generally, though a slight improvement was reported at certain quarries; there was some short time in the Festiniog district. Employment continued quiet in the Ballachulish (Argyllshire) quarries, where only five days a week were worked.

In our last issue we referred to two varieties of foreign green slates which retain their colour well. We have not space to deal with all the varieties on the market, but we would, however, refer to another excellent variety—namely, the "Arfon" unfading green slates. These have been on the English market for 10 years, and are largely favoured by architects, which proves that they are far removed from the category of those inferior slates to which we have referred in previous reports in these columns. The "Arfon" slates come from the United States, and the quality may be depended upon owing to the careful supervision of the slates exported. In addition to the unfading green variety of "Arfon" slates, blue and terra-cotta red varieties are supplied. In all three colours slates are supplied in the usual Welsh sizes—namely, from 26ins. by 14ins. to 10ins. by 6ins. The English agents, Messrs. Pearson Brothers & Campbell, of 18, Water Street, Liverpool, keep a large stock on hand. The green variety is of a beautiful soft greenish grey tone.

Trade in the Broseley district is still dull, and but for the number of schools now being erected in the country times would be very dull. The Broseley trade in the South of England has doubtless suffered owing to the large number of machine-made pressed tiles now being produced. Nearly all the large makers in Sussex and Hampshire now make these, and they are selling freely and, doubtless, at remunerative rates, as the cost of carriage is low compared with that from the Broseley districts.

The Sussex tile trade is fairly good and building contracts more numerous, schools again being numerous.

There has been a demand of late for green glazed roofing tiles, similar to those used on the Savoy Hotel. The supply of these hitherto has been somewhat fitful, but users of these will be glad to hear that in future a stock will always be available in London sufficient for an area of 200 squares, and reasonable notice will ensure a supply of any quantity in excess of these. It may not be generally known that the cost of fixing these is somewhat in excess of the cost of the tiles, and consequently are the most expensive of any tile roof covering. It is possible to obtain green glazed roofing tiles of the usual shape with due notice, and the samples of these produced can be varied in colour to suit requirements; the cost of these is about four times that of ordinary roofing tiles.

THE TIMBER TRADE.

The Board of Trade reports that during July employment with millsawyers and woodcutting machinists was moderate on the whole. Trade Unions with a membership of 4,397 reported 188 (or 4·3 per cent.) as unemployed at the end of July, the same percentage as at the end of June. The percentage for July, 1905, was 5·1. Employment was reported as good at Birmingham and Edinburgh, and as dull in London.

Messrs. C. Leary & Co. in their mid-monthly report state that the imports of mahogany during the first half of this month have been on a very small scale, consisting for the most part of Cuba. The position consequently continues strongly in sellers' favour. Fresh supplies are much needed and early arrivals would meet with a ready sale at full rates. Cargo quotations are as follows:—Tobasco 3½d. to 6d., Minatitlan and Tecolutla 3½d. to 4½d., Guatemalan 4d. to 5½d., Honduras 4½d. to 6½d., Nicaraguan 3½d. to 6d., Costa Rican 3½d. to 5d., Panama 3½d. to 4½d., Axim, &c., 3½d. to 5d., Lagos 3½d. to 5d., Benin 4d. to 5d., Niger 3½d. to 4½d., Gaboon 2d., Cuba 4½d. to 6½d., St. Domingo and Jamaican 4d. to 5½d. per foot.

This firm also reports that there have been no arrivals in regard to cedar, and the market is again bare of stock and would absorb considerable quantities at full rates, as there is a strong and well sustained inquiry. Quotations in parcel are as follows:—Mexican 4½d. to 6½d., Honduras 4½d. to 7d., Panama 3d. to 5d., Costa Rican 3½d. to 5d., Cuba 4½d. to 6½d., Trinidad 4d. to 5d., Paraguay 2½d. to 4d. per foot.

A notification has been received from the India Office that tenders will shortly be invited for the purchase on a long lease of valuable timber standing in the north and middle Andaman Islands. The estimated amount of timber to be removed is as follows: Red Padauk, about 10,000 to 12,000 tons annually. Koko, about 500 tons annually. Gurjan, about the same quantity as Padauk. Pynima, about 200 to 300 tons annually. White Chuglam, about 600 to 800 tons annually. Black Chuglam, about 400 tons annually. In addition to the above there are several other less valuable timbers available in varying quantities. All the above timbers float in sea water, and the cost of extraction from forest to harbour is estimated at from Rs.14 to Rs.16 per ton. No labour is available in the island, but it may be imported from Madras at a moderate cost. Further information may be obtained by direct application to the Inspector-General of Forests to the Government of India, Simla.

THE PAINT TRADES.

The paint trades continue fair. As regards materials, the returns for imports and exports for July, 1906, as compared with the same month in 1904 and 1905, are as follows:—

Imports.

	Cwts.			Value.		
	1904.	1905.	1906.	1904.	1905.	1906.

THE GLASS TRADE.

The glass trade continues fair. The Board of Trade reports that employment in July continued moderate, but was better than a month ago and a year ago. Employment continued good with sheet-glass makers and flatteners at St. Helens. It was fair with glass blowers in London and with plate-glass bevellers at Birmingham.

The returns for imports and exports of glass for the month of July, 1906, as compared with the same month in 1904 and 1905, are as follows:—

Imports.

	Cwts.			Value.		
	1904.	1905.	1906.	1904.	1905.	1906.

THE IRON AND STEEL TRADES.

Recent Progress.

Neither in prices nor in tonnage have the past few weeks placed anything on record to realise the hopes that had been entertained for the opening of the half-year.

In fact, throughout the whole range of the home markets the prevailing tone has been one of flatness and mediocrity. Here and there makers and merchants have made obstinate efforts to maintain prices at normal level, but in several lines there have been instances of distinct falling off.

In Birmingham the general outlook was conspicuously disappointing. The reduction in the price of marked iron bars, to which we referred in the last issue of the "Contractors' Supplement," caused no appreciable increase in demand. As a natural consequence, the price of common iron bars touched a lower level than has been reported for some time past, and although sales were not heavy there were offers on the market at £6 5s. per ton and thereabouts.

Corrugated sheets found a very brisk demand. The increased figure of the association was well maintained, and in many cases exceeded. Good business was done at £12 12s. 6d., and in odd cases at £12 15s. per ton. This is the one line, perhaps, in which the prices of the present year have shown a steady and consistent advance throughout.

Considerable business was done in rolled steel joists, angles and tees at comparatively good figures. Marked iron bars were quoted at £8 10s.; angles at £6 12s. 6d. to £6 15s.; joists at £6 17s. 6d. to £7 2s. 6d., and girder plates at about £7 10s., all per ton.

Structural steel also showed a slight improvement in Lancashire, where a considerable amount of work has been in progress.

In Scotland the position all round remained practically unchanged, although a certain firmness was given to prices of rolled steel shapes through the absence of any appreciable competition from Germany. Iron angles maintained their figure of £7 2s. 6d.; bars, £7; whilst steel bars changed hands at £6 17s. 6d. to £7, and angles at £7 17s. 6d. to £8, all per ton.

In Continental material the situation showed no signs of weakening. As a matter of fact, the majority of makers of structural steel shapes were busier than ever in their efforts to cope with the home demand. In rolled steel joists there was but small demand on this side. Prices did not not alter in any material degree, merchants quoting on the basis of £6 2s. 6d. and thereabouts for delivery ex steamer Thames. The time of dispatch, of course, always varies according to the nature of the specification, but few merchants seemed inclined to promise anything better than about ten weeks for delivery on this side of an ordinary lot of German standard sections. This has militated considerably against the market so far as British consumers are concerned, as makers on this side can offer a much more expeditious fulfilment of orders.

The Present Position.

It may reasonably be accepted as a sign of the times that several leading steel makers announce largely increased profits in their statements of account for the past half-year, and seem to be unanimous in anticipating a similar happy result for the current half-year. So far as structural steel is concerned, pig-iron prices are not a very good index to follow, but where a consistent upward movement takes place in the latter, apart from the daily fluctuations, it is fairly safe to assume that the price of manufactured steel will in due course follow suit. In Scotland, Cleveland and Staffordshire the tendency in pig-iron has been very strong, and at the same time there has been an agreeable firmness in the prices quoted for manufactured steel. There have been no advances in structural steel shapes, but all round prices have been well maintained and the outlook is distinctly hopeful. The following are a few representative figures in lines which affect the building trades:—

Iron and Steel Prices (per ton).

	£	s.	d.
Marked iron bars, Staffs.	8	10	0
Steel joists ,,	7	0	0
,, girder plates ,,	7	10	0
,, angles ,,	6	12	6
Common iron bars ,,	6	5	0
Gas tube strip ,,	6	10	0
Galvanised sheets ,,	12	12	6
Steel angles, Cleveland	6	12	6
Iron angles ,,	7	2	6
Common iron bars, Cleveland	7	5	0
Steel joists ,,	6	5	0
,, plates ,,	7	17	6
Best iron bars, Lancs.	7	10	0
Iron angles ,,	7	5	0
Iron angles, Scotland	7	2	6
Common iron bars, Scotland	7	2	6
Best iron bars ,,	7	7	6
Steel angles ,,	7	0	0
,, bars ,,	7	17	6

The increased briskness in demand during the past week or two, particularly in structural steel, has been most marked in the Cleveland district, where a very good volume of business has been done. As will be observed from the foregoing list, prices are very much the same as they have been for the past three months, but there is every indication that an early increase may be looked for. It is also important to note that whilst the nominal figures have remained practically stationary during this period, there has hitherto been considerable undercutting by various merchants and makers, whereas at present all sellers are more inclined to toe the line.

In Scotland also there is a marked briskness in raw iron, but this has not yet extended to structural steel. At the same time, a fair and improving demand is reported in steel joists and in lighter rolled shapes, and makers have so far been successful in keeping prices firm. Fresh contracts are being entered into at current prices, which furnishes good evidence that buyers do not anticipate a slackening off in the near future. There is a fair amount of work in progress, and the outlook is better than it has been for some weeks past

The half-year has progressed without any marked change having taken place in the market with regard to Continental structural steel. The following are a few current prices in Continental steel, which include freight for the Thames, east coast ports, and places a moderate distance inland:—

Continental Steel Prices (per ton).

	£	s.	d.
Steel Joists	£6	3	6
Steel Channels	6	7	6
Iron Rods	7	4	6
Steel Angles	6	7	6
Steel Tees	6	10	0
Steel Plates	6	17	6
Steel Rods	7	7	6
Square Steel Bars	6	7	6

The prices given are for ordinary specifications of 10 tons and upwards. Deliveries continue to be very slow, occupying some nine or ten weeks. It is quite within the bounds of possibility that the next few weeks may see advances upon some of the foregoing figures, and this circumstance, coupled with the consideration of time, will still further prejudice business in the eyes of the British consumer.

OTHER METALS.

The copper market has shown a considerable access of strength latterly. Price fluctuations have been comparatively small, and demand in this country has improved with the approach of autumn. Standard copper is now quoted at about £84 per ton, and there is every prospect of advances upon this figure. American supplies are running short, and the "Amalgamated" are committed for large quantities over the next month or two. Electrolytic is quoted at £88, and strong sheets at £97 per ton. So far as can be seen at present, there is no likelihood of anything but increases upon these figures for some time to come, as both in America and this country there is every indication of improved demand from all consuming industries.

Lead has also shown considerable strength during the past few weeks, and there are strong prospects of continued briskness. Present prices are as follows: English, £17 10s.; Soft Foreign, £17; Pipes, £20; Sheets, £19 15s., all per ton and for home markets.

The tin market has pulled round lately to a remarkable extent, although at the immediate present it is suffering a slight relapse. The current price for the Straits metal is £182, and for English £180 per ton.

THE IRONMONGERY TRADE.

The Board of Trade returns for July show that employment at Wolverhampton in the lock and latch trades continued bad, short time being general. With makers of hollow-ware it continued good. Employment with hollow-ware makers continued slack at Sheffield; at Birmingham it was moderate; at West Bromwich it was quiet.

Employment in the stoves, grates, &c., trades was fair at Glasgow and Falkirk; moderate in Suffolk and Essex; slack at Rotherham, and bad at Leicester, and also at Leeds, where short time was worked.

With nut and bolt makers employment was good at Winlaton and in South Wales, where some overtime was worked; at Darlaston it continued good. With cut nail and rivet makers it continued fair at Birmingham. At Blackheath employment with rivet makers was quiet, and fair with nail makers.

Employment in the wire trade continued good in the important centres. With wire weavers in Glasgow it remained dull.

THE WALLPAPER TRADE.

The wallpaper trade shows little or no movement. The Board of Trade returns of exports and imports for the seven months of this year ending July 31st show that paper hangings to the value of £99,282 were imported this year as against £80,955 worth last year; the exports are valued at £141,639 in 1906, as against £133,980 in 1905 and £139,768 in 1904.

The following is the return of paper-hangings for July:—

	1904.	1905.	1906.
IMPORTS.			
Cwts.... ...	—	2,664	2.300
Value... ...	—	£7,443	6,986
EXPORTS.			
Cwts.... ...	5,286	6,522	9,453
Value... ...	£12,377	13,999	20.459

That big combination Wallpaper Manufacturers Limited have been threatened with competition, but since the flotation of the combination, in the summer of 1899, only two companies have been started to manufacture wallpapers in opposition, and neither of these has, as yet, attained any degree of magnitude. The larger of the two concerns has now been acquired by the combine, namely Messrs. Page, Arnold and Co. Ltd., of Holmfield Mills, Halifax (Yorks) and London. Among the directors of the Halifax Company is Mr. G. E. A. Line, who is a member of the well-known firm of John Line's, Sons, and McDougall, wallpaper merchants of London, Manchester and elsewhere.

The Labour Market

Board of Trade Returns for July.

The Board of Trade returns show that employment in the building trades in July continued dull on the whole, though it was slightly better than a month ago. Compared with a year ago it showed little change.

In London

employment was rather better than a month ago, but it was not so good as in July, 1905. Returns received from 57 London employers show that in the last week of July 9,993 workpeople of all classes were paid wages, as compared with 9,556 in June, and 11,441 in July, 1905.

Trade Union returns relating to carpenters and joiners show that the percentage of unemployed in July was 7·8 as compared with 9·4 a month ago, and 7·9 a year ago. With plumbers the percentage for July was 14·3, for June 13·7, and for July 1905, 11·1. In both trades the percentage of unemployed was higher in London than in any other district. With bricklayers and plasterers employment was rather better than in the previous month; with masons a considerable improvement was shown, though employment continued dull, and with painters little change was shown.

The Provinces.

Returns received from 72 Employers' Associations in towns outside London show that employment in these towns continued quiet, and, on the whole, rather worse than a year ago.

The trade unions report, however: Employment with bricklayers and masons was dull on the whole, but somewhat better than a month ago. With carpenters and joiners it continued slack, but was slightly better than a month ago and a year ago.

In the Northern Counties

employment was quiet on the whole, and about the same as a month and a year ago. With painters a falling off was reported; with slaters and tilers short time was general in the Tyne district.

In Yorkshire

employment generally continued quiet. In Sheffield, however, it was slightly better than a month ago.

In Lancashire and Cheshire

employment continued fair. With bricklayers and masons it was rather better, but in other branches, especially with painters, there was a falling off.

As regards the Midlands and Eastern Counties

in Derbyshire employment was slack; in Leicestershire it was quiet; in Nottingham it was moderate. In the Eastern counties employment was slack generally.

In the Southern and South-Western Counties

employment continued quiet in the Three Towns district and in South Wales. There was a slight improvement at Bristol.

In Scotland

employment was moderate generally. In the Clyde district it was rather better than a month ago with bricklayers and joiners; with plasterers and painters it was worse.

In Ireland

at Belfast and Dublin employment was fair generally. At Cork it was fairly good, and better than a month ago.

Builders' Current Price List of Specialities

This list is not intended to promote undercutting, and prices are subject to discounts for a quantity and for cash. Readers are advised to write for these discounts. Where prices for goods are standardised and fluctuation takes place in trade discounts, our prices have the discounts deducted. In some cases it is difficult for firms to quote prices, and we have stated where they will be pleased to send catalogues and quotations immediately on receipt of applications.

Goods.	Description.	Merchants or Manufacturers.	Address.	Size.	Weight.	Quantity. per	Price

Men Here and Elsewhere. A MOST uninspiring production on the face of it, but one, nevertheless, which sets forth a multitude of valuable and interesting facts, is the Third Abstract of Foreign Labour Statistics just issued by the Labour Department of the Board of Trade. For the most part—and there is a good deal of it (more than 300 pages)—the book consists of a series of tables of wages, hours of labour, trade-union numbers, &c., in various countries of Europe, in the United States, and in Japan. The European countries of which figures are given comprise Russia, Norway, Sweden, Denmark, Germany, Holland, Belgium, France, Italy, Austria-Hungary, Switzerland and Spain, and, as the latest figures available are followed, the result is a very serviceable comparative record. To attempt any elaborate summary of the figures relating to the various branches of the building trade in the several countries would be quite outside our present space, and, except to a few statisticians, would not be of much interest. We may, however, extract a few comparative facts. Taking the wages of bricklayers in London, for example, at an average of 10½d. per hour, or 43s. 9d. for an average of 50 working hours per week, we turn to the figures for New York and we see what an immense difference there is in the rate of wages, with an appreciable reduction in the number of working hours, these being respectively 2s. 8½d. and 44 hours, giving a sum of £5 19s. 2d. as the weekly total. Yet in England the wages are higher than they are on the Continent. In Berlin the bricklayer gets 8½d.; in Paris, 7¾d.; in Christiania, 6¾d.; in Amsterdam, 5½d.; in Brussels, 3¾d.; and in Rome, 3¼d.; while the hours of labour per week are as follows: Berlin 53, Paris 54, Christiania 60, Amsterdam 58½, Brussels (no figures given), Rome 60. From this it will be seen that bricklayers in London work fewer hours and get paid higher wages than they do in foreign cities. And there is very much the same thing to record in respect of other building trade employees—masons, carpenters, plumbers, plasterers, &c. Belgium and Italy of course provide the greatest contrasts to ourselves. With regard to the trade-unions, the figures in the Abstract indicate that it is in those countries of progressive industrial development that trade-unionism makes steady and, in some cases, rapid growth. In Germany, for example, during 1899 and 1904 the social democratic societies (*Geweskschaften*) nearly doubled their membership, and they now embrace more than two-thirds of the organised workers there—in fact, they are the largest trade societies in the country; in France, too, rapid growth has taken place, the building trades having the largest number of organisations; but in Denmark a noticeable diminution has occurred. The above are just a few of the interesting facts given in the Abstract. Of the rest we would leave readers to study for themselves. We would observe in conclusion, however, that there is a good deal said about conciliation and arbitration, and one of the most interesting statements is that the voluntary Boards of Conciliation and Arbitration which play so large a part in the settlement of industrial disputes in the United Kingdom hardly exist in foreign countries. So much do we hear about our own deficiencies, and so much about the wonderful merits of others, that facts like these are decidedly refreshing.

The Office Tower Again. SOME time ago we made a suggestion in these columns about office towers—tall shafts of buildings to be erected on a comparatively small area, with a suite of offices on each floor: the idea being to enable occupiers to get abundance of light and air, as compared with the huddling of rooms in basements or semi-basements, or in places where the air is stagnant and the light very deficient. The suggestion having been made in these columns, we were glad to see in the *Daily Chronicle* last Friday an announcement from a Berlin correspondent to the effect that Dr. Scherl, a well-known physician in the German capital, and an authority on national hygiene, has made a proposal to the Berlin Town Council that they should build "airy pavilions at several points of the city at about 160ft. above the level of the streets," these pavilions being reached by elevators, and intended "to afford rest and refreshment and good air to citizens weary of the maddening noises, the unrest, and the noxious smells of the streets." The proposal is not quite the same as our own, but it has a similar object in view. We shall be interested to hear what comes of it.

The Ancient Subject. THERE is quite a collection of subjects relating to architecture which have been dealt with so many times during the past fifty years, and still live on in hoary age, that we have become quite resigned to see them brought forward at regular intervals—unnoticed, it is true, by the generation which grew up with them, but evincing in the younger blood a sort of stir of enthusiasm. Such are "colour in architecture," "the collaboration of architect and sculptor" and all the rest—good old stock subjects for every president to fill up his address with, in between the snippets about professional practice and new buildings; subjects revered by the congress-monger as being of that excellent variety which will foster discussion on a vague basis without any risk of awkward personalities. Would that they could be buried—at least for a decade. We have only to turn to reports of meetings in the 'fifties to see that members were still at it then, hammering away in a mild form. Oh, for the sledge-hammer to flatten them out!

A MOSQUE FOR LONDON.

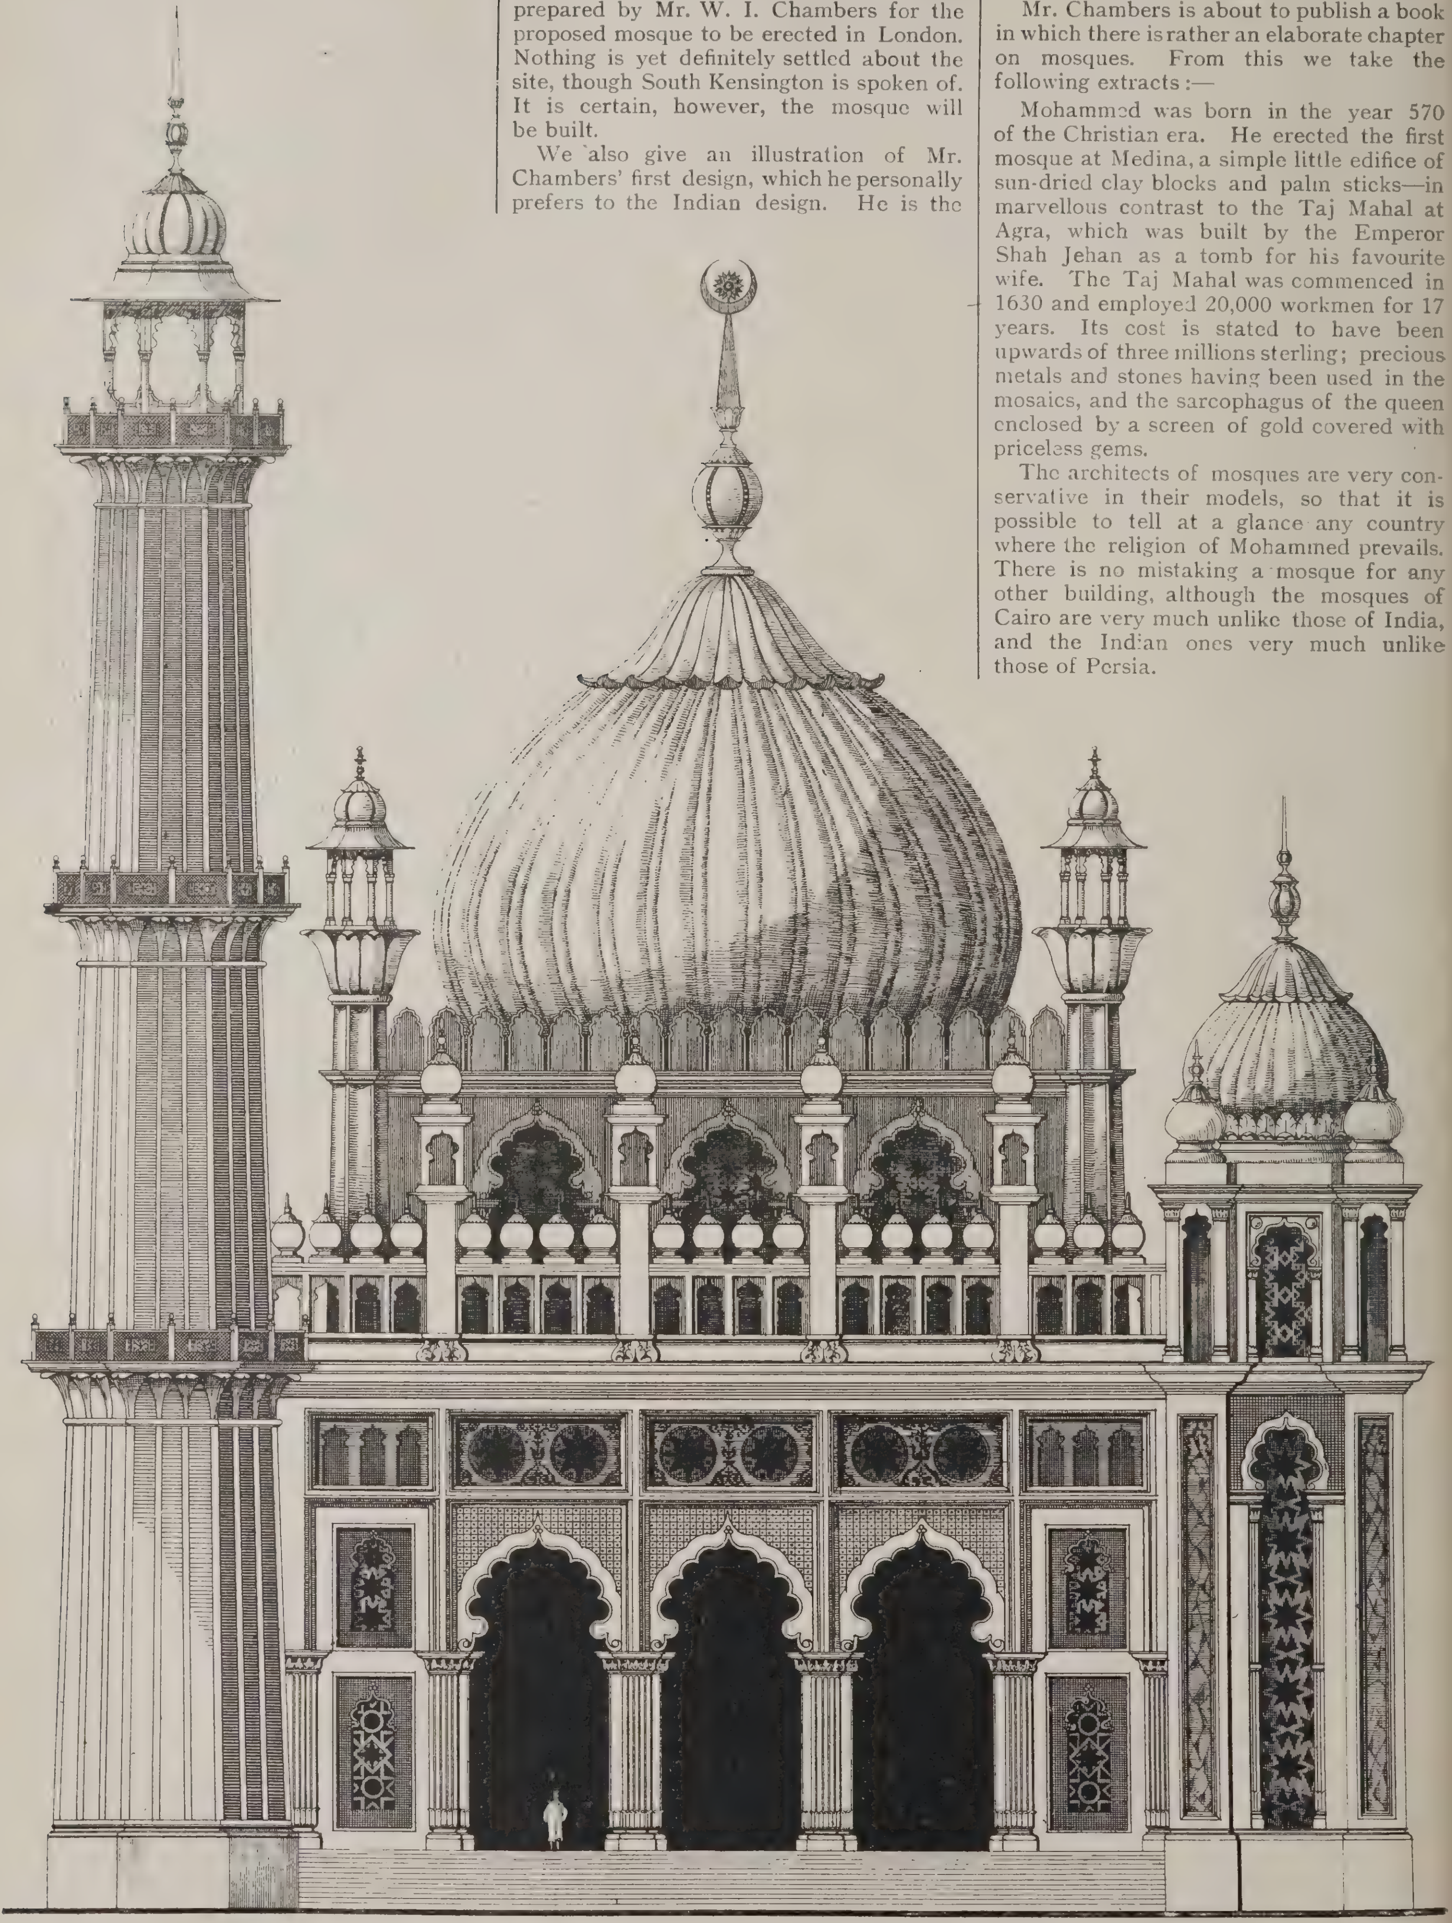
We illustrate on this page the design prepared by Mr. W. I. Chambers for the proposed mosque to be erected in London. Nothing is yet definitely settled about the site, though South Kensington is spoken of. It is certain, however, the mosque will be built.

We also give an illustration of Mr. Chambers' first design, which he personally prefers to the Indian design. He is the architect of the mosque erected at Woking about fifteen years ago. At that time it was the only one of its kind in Europe.

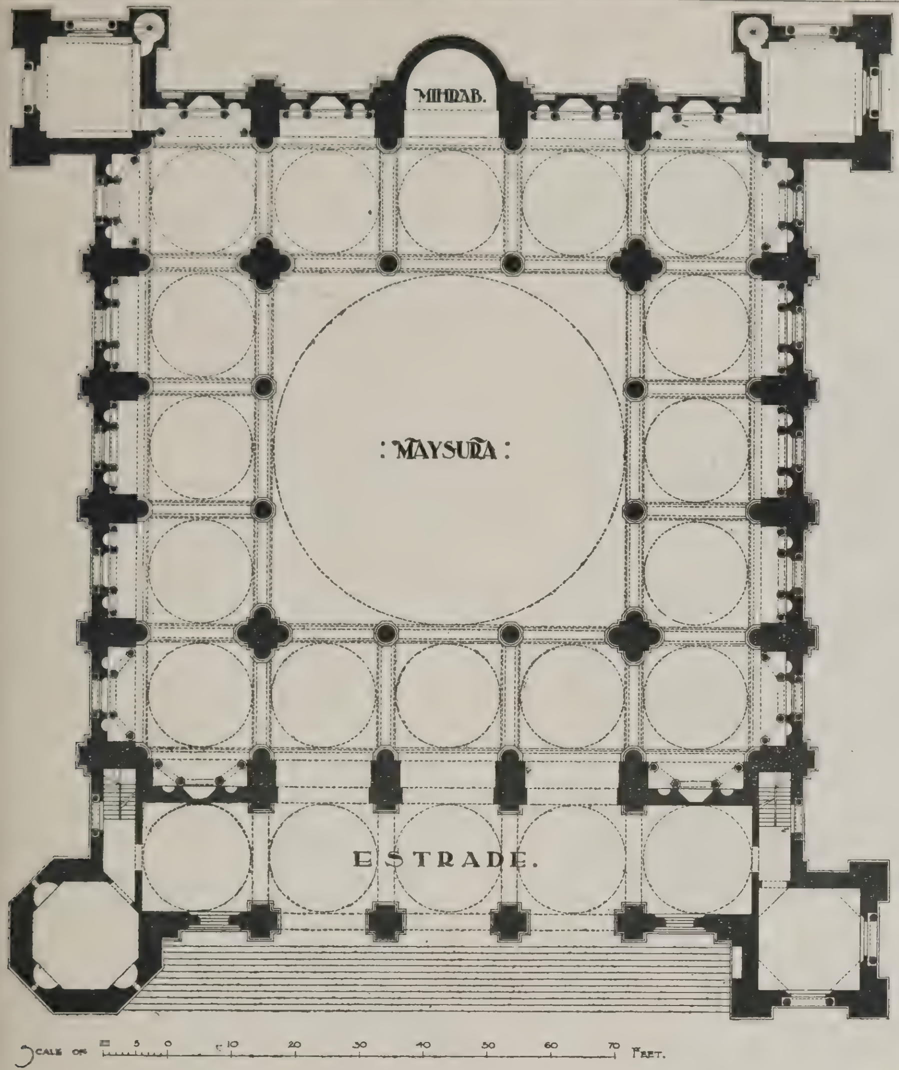
Mr. Chambers is about to publish a book in which there is rather an elaborate chapter on mosques. From this we take the following extracts:—

Mohammed was born in the year 570 of the Christian era. He erected the first mosque at Medina, a simple little edifice of sun-dried clay blocks and palm sticks—in marvellous contrast to the Taj Mahal at Agra, which was built by the Emperor Shah Jehan as a tomb for his favourite wife. The Taj Mahal was commenced in 1630 and employed 20,000 workmen for 17 years. Its cost is stated to have been upwards of three millions sterling; precious metals and stones having been used in the mosaics, and the sarcophagus of the queen enclosed by a screen of gold covered with priceless gems.

The architects of mosques are very conservative in their models, so that it is possible to tell at a glance any country where the religion of Mohammed prevails. There is no mistaking a mosque for any other building, although the mosques of Cairo are very much unlike those of India, and the Indian ones very much unlike those of Persia.



PROPOSED MOSQUE FOR LONDON. W. I. CHAMBERS, ARCHITECT.



It is not generally known that the architects of the earlier mosques were the first to use the pointed arch from which sprang the style we call Gothic, also that owing to the Koran forbidding the representation of any living thing about the mosque the old Saracens invented a style of ornament purely geometrical, some of which is exquisite—for example, their pierced stone and marble lattices and doors.

Some of the domes of mosques in India are marvels of construction. That of the Tomb of Mahmud at Bijapur is 135 feet in diameter. This is practically the size of the dome of Florence Cathedral, but this latter rises from an octagon, whereas the former springs from a square base, presenting difficulties not encountered at Florence, and the way these have been overcome is certainly beautiful.

Islam possesses the finest dome in the world, for Sta. Sophia at Constantinople has never been approached.

Points of Planning.

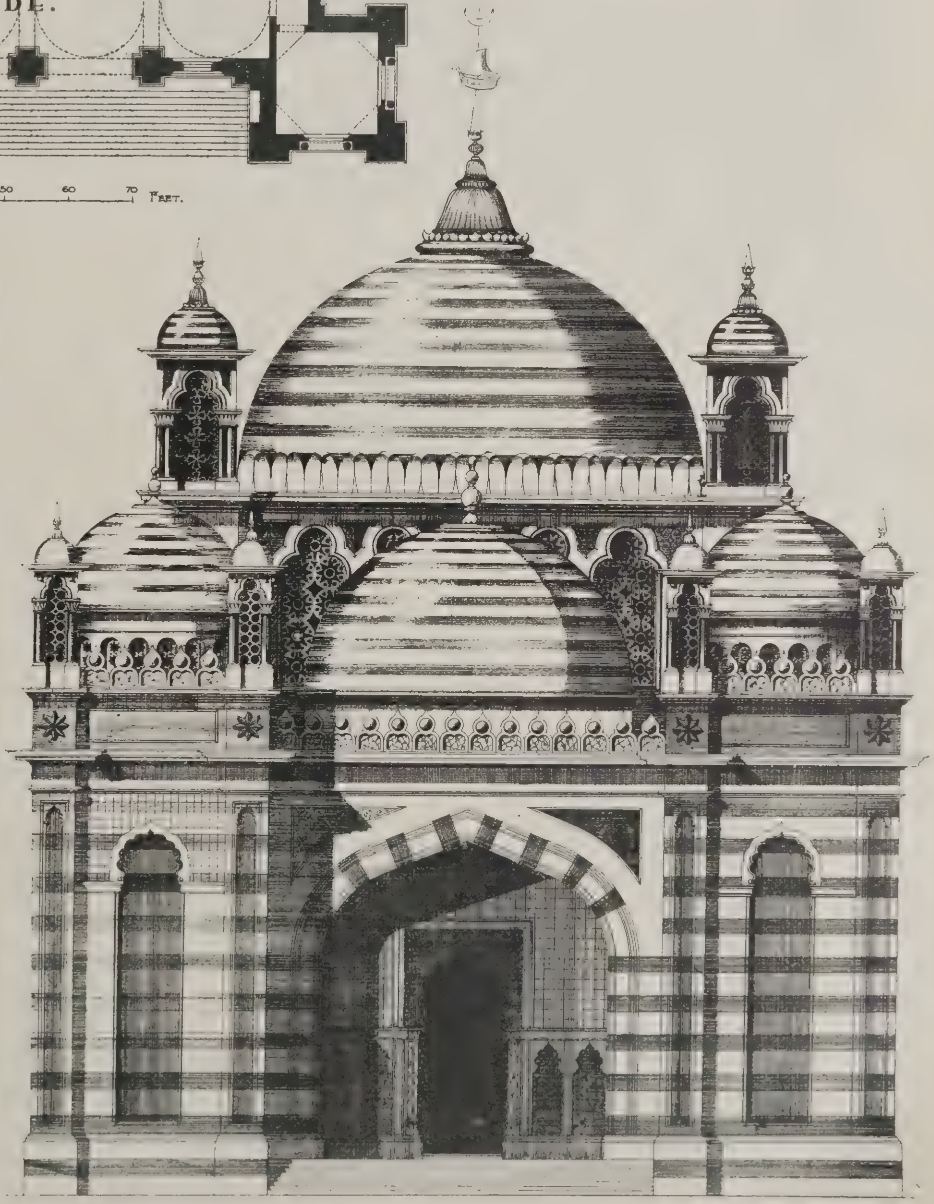
The plan of a mosque is not unlike a Christian church. One of the requirements is that the principle interior wall facing those who pray must be in the direction of Mecca: when the mosque at Woking was built this was considered so important that a captain of a P. & O. boat took the bearings, and the true direction is engraved on a stone under cover near the "mihrab," which is a recess in the wall corresponding to the apse of our churches. The mihrab is always the richest and most adorned part of the edifice. Sometimes there are other niches in the same wall called "pseudo mihrabs," and sometimes these are outside the building; but, whatever their position, they must be so situated that the worshipper faces Mecca when he prays.

The next most holy place is the space in front of the mihrab called the "maysura," corresponding to the nave of our churches. In it are situated the "mimbar" (pulpit) and the "dekke," a kind of reading desk used for the reading of the sacred book. No unbeliever can enter here, nor can a Mohammedan without removing his feet covering.

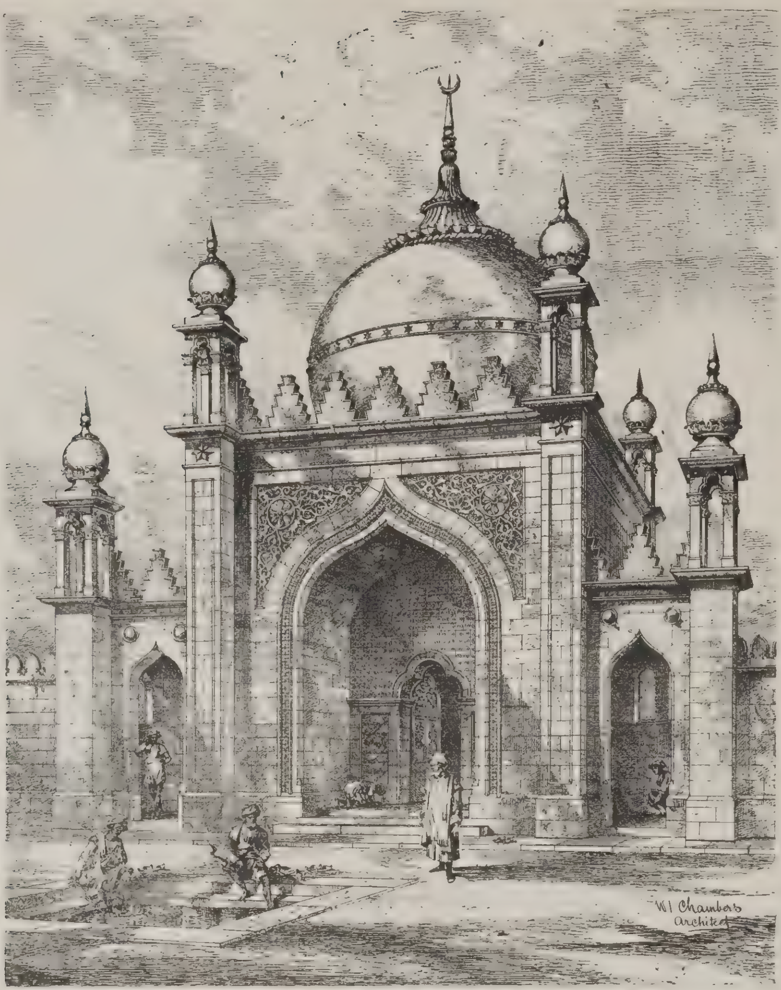
There is also an "estrade," meaning a platform, elevated by one or more steps, corresponding to the narthex of our churches. This is open, next the enclosed space in front of the mosque called the court, wherein is always a well or fountain or reservoir of pure water called the "meidaah," where the faithful can perform their ablutions before entering the mosque. The court can be entered without removal of boots: it corresponds to the court of the Gentiles and is always enclosed. There is generally a portico entrance, and under this portico the learned men give instructions to students; in fact, very often rooms are annexed to this portico for the use of the students.

The Chief Feature.

The chief glory of a mosque, and that calling for the architect's utmost skill, is



PROPOSED MOSQUE FOR LONDON (First Design). W. I. CHAMBERS, ARCHITECT.



MOSQUE AT WOKING. W. I. CHAMBERS, ARCHITECT.

the minaret, a special feature of mosques. The most exquisite of these is said to be that of the mosque of Rani Sipri. The number and position of minarets is a matter of taste; the mosque at Mecca has seven and that of Herat nine; if there is only one it is generally at the side and at a little distance away. The number of the balconies that grace a minaret depends on the taste of the architect and the importance of the building, the balconies being used by the "muezzin" for the purpose of calling the faithful to prayer. The ornament that crowns a minaret (or dome) generally takes the form of a crescent raised on two or three globes; this, however, is not universal, as some have the form of a boat—symbol of the vessel of faith; the various objects in a mosque consecrated to worship have similar terminals. As a rule minarets are more ornamental than the spires of our churches.

When the mosque in London is erected it is hoped that it and Mohammedans will receive every consideration, in view of the fact that the Mohammedan subjects of the King far outnumber Christians or those practising any other form of religion in his dominions.

The architect desires the London mosque to be pure white with the domes gilded. It is thought that Doulton Carrara material, as in the Savoy extension, may be used. Some of those connected with the mosque desire it to be green—the colour of Islam: so probably it will be composed of white and green. In any case, it is bound to be a unique building in the metropolis.

DEAD ARCHITECTURE.*

By Louis H. Gibson.

I know an architect who believes that he can accomplish more for his art by placing himself in sympathy with a body of laymen than by addressing his professional associates. It is his understanding of history that architects merely reflect the spirit of the people.

Institutional methods of education, conspicuously the architectural schools, develop memory and the faculty of imitation. They inculcate great respect, if not reverence, for facts. The pedagogical methods of developing the imitative faculties are wonderfully skilful and ingenious. However, those who see visions find little encouragement in the schools. The dreamer is an outcast, if he be not a giant, and then he will desert or reform the school. Such a one was Richardson, in architecture, and Sullivan. These men knew facts; they had memory; they knew history; they were able to imitate; yet they dreamed, they saw visions, they had ideals. Memory was a resource, the faculty of imitation the medium of expression. Imagination blazed the trail. Dreams led to idealisation; idealisation to manifestation in architecture. In the neglect of the spirit of things, we lose the life of things.

The Stuffed Mind.

Most of our education consists in the consideration of innumerable facts without a proper comprehension of their intimate and logical relation to principle.

It is entirely possible for an architect, for instance, to go through any of the schools of architecture or to know never so well the chronological history of his art, to have stored his mind with great volumes of facts relating to form, colour, decoration, arrangement of details, to have had extensive practice in their imitative use, and yet not understand the underlying principles of architecture. The isolated facts with which he has stored his memory, his theories, examples and the detailed imitative experiences which have come to him are a positive burden without imagination and the constructive sense.

Everlasting Tradition.

Of all the arts, the art of architecture is the least alive. It rests almost wholly upon the traditions of the past. It is the only art where respect for precedent implies bondage. We have music to-day than which the world knows none better. We have literature which is in no way controlled by the past, by memory. We have great paintings not yet dry upon the easel. Sculpture is modern and expressive of present-day emotions. It is not imitative. Only in architectural art do we feign the expressions of the past.

The architecture of the Greeks expressed the sentiment and culture of their civilisation; that of the Romans stood for organisation, formula, control; mediæval architecture was expressive of religion and the sentiment of the Infinite; while the period of the Renaissance was identical with the spirit of research and the retrospective view. But the spirit of the present is not expressed in our architecture. We clothe our thoughts in the tattered, objective garments of the Greek, the Roman, the Mediæval, the Renaissance period.

Two Great Examples.

As illustrative examples, we will consider two great libraries. Our people are at least serious in housing their books. A library building, more than any other, is our most deliberate and painstaking architectural expression.

The library at Washington is the most earnest, artistic effort on the part of our Government in recent years. We made some progress during the time it was building. The structure shows it. The exterior indicates serious and earnest effort, but the result is crude. The composition is not pleasing and the detail is coarse. Those who had general charge of the structure recognised its deficiencies before the building was finished, and a change of scheme was the result. The interior, so far as it was possible to change it within the limits of the structural forms of the previous administration, shows the hand of a master of academic architecture. It is the interpretation of the Renaissance, as seen through the eyes of the Ecole des Beaux-Arts in Paris. From an architectural point of view there is not a spark of originality nor national character within the material form of this building. The floor plan is good, much better than that of the Boston Public Library; the exterior is crude and a part of the interior is masterly, from the French standpoint. It is the Paris Ecole des Beaux-Arts at liberty in America. As we view the work we may well ask, Where are we—Germany, France, Italy, or has an architect gone to Brazil? Where are we? What of American history and American life? Have we done nothing? Have we no history? Have we no individual thought to express? Or have we been taught not to express it? Have we been directed to study only the shell of architecture?

---

* Extracts from a paper read at a meeting of the John Herron Art Institute, Indianapolis, Ind.

There is nothing local or American in the decoration of the walls of the Library of Congress. Are our artists not represented on these walls? By masterly technique, yes. By expressions of American life or history, no. The same subjects would do well for a building in a new African province without history, but not for a nation that has lived and builded history in a great way. Here is a list of some of the decorative subjects treated on the walls: Minerva, Writing, Literature, Law, Michael Angelo, Religion, Beethoven, the Graces, the Seasons, the Virtues, Government, &c. Much of this is painted in a great way, so far as mere painting goes, but none of it represents a single thought or characteristic connected with our history or people.

Then turn to the Boston Public Library. The building is a refined Italian importation. It is architecture as it was in the fifteenth century. The general motive of the front is more modern, but all other parts and the detail of all parts are imported directly out of the fifteenth century. There is a great building, but not great expressive art; great painting and drawing, but not great characteristic art. Mr. Sargent, a great technician, represents Eastern or mythological subjects; Pasht, the cat-headed three-eyed goddess, the Ibis of the Nile; Puvis-de-Chavannes paints "the Muses acclaiming Genius, the Messenger of Light."

Where is New England, with its splendid history, its educational work and all that it has done for the civilisation of this country? The people of a hundred years from now will look to the decoration of this building and find nothing of historic interest. They will wonder why the great things of our time or history found no record on the walls of this building.

Old Colonial Houses.

The truest architectural expressions that America has known were to be found in the buildings of the Old Colonial period. The medium was a Renaissance departure, yet material, colour, form were idealised and inspirited to express Old Colonial life. It was careful, thorough, academic house-building. We know the early New England people as thoughtful, refined in a way, very severe and exact: and we find the architecture of that period expressing as clearly as possible all these qualities. There is no suggestion of the picturesque either in the personality or the architecture. There is no mere prettiness. It is truthful, severe and refined. It carries with it a certain reserved, dignified, quiet beauty and nobility which comes from seriousness and concentration. We architects undertake to build Old Colonial houses to-day. We memorise Old Colonial details and imitate the forms. But we do not supply the character.

Distorted Self-Consciousness.

There was a time when Greek and Mediæval and Renaissance art were L'Art Nouveau. The perception of its beauty was the fatal moment. It then ceased to be an unconscious expression. Convulsive clinging to æsthetic effort means loss of real mastery. Our Art Nouveau carries with it a suggestion of failure. It is an exaggerated expression of self-consciousness. In that it clearly expresses a distorted self-consciousness, it is effective. In that the expression of this condition of mind is not desirable, such an expression is out of place: and a thing out of place is never true art. New art is the expression of new thought; the now, and not the taking-on of a new skin.

MANCHESTER ARCHITECTS.

The Sketchers.

The last two sketching excursions of the Manchester Society of Architects have been a great success. Hull was made the headquarters at the Bank Holiday week-end, being a good centre for the fine group of churches in the neighbourhood. Saturday was spent at Beverley, in the Minster and St. Mary's Church. On Sunday the principal buildings in the town were viewed. Hull has been practically rebuilt within recent years, and is now admirably laid out with wide streets and avenues of trees.

The 14th century parish church is the most important ecclesiastical building: there are also St. Mary's, by the late G. E. Street, which has a good covered ambulatory from the tower to the door at the west end, and Mr. Temple Moore's St. Augustine's; this latter still requires the fine tower at the west end, which is shown on a drawing inside the church. The Congregational church of Messrs. Molds & Porrit, octagonal on plan, is in a freer style and admirably meets its requirements. The new School of Art by Messrs. Lanchester, Stewart & Rickards was very greatly admired.

Monday was spent at the beautiful Decorated church at Patrington. Internally, it is not far short of perfection. The nave and choir have curved wooden roofs and the aisles are groined in stone with pleasing variety. The wide transepts enable delightful cross views to be obtained. The piers and arches are all most beautiful in proportion and detail. The transepts are each arranged for three chapels; the north transept now contains the organ, but on the south side the altar of the centre chapel is in an octagonal recess groined over, the large boss at the centre over the altar being hollowed out for a reliquary or tabernacle. The south porch has a parvise over with charming little windows looking into the aisle. "So difficult did we find it to leave Patrington that only half an hour could be spent at Hedon, where the glorious centre tower (Perpendicular) made us regret that sketching on this trip was finished."

On Saturday, August 18th, Bunbury Church, in Cheshire, was the object of getting up at 5.30 a.m. The present building was commenced about 1380 by Sir Hugh Calveley, who founded a college here, but there are sufficient remains to show that a Norman church once existed. There is a fine dignified tower at the west end with buttresses on the west face only, and over the south porch is a statue of St. Boniface, the patron saint. Internally, the nave has very light and graceful Perpendicular shafts. The Egerton Chapel occupies the east end of the south aisle, being separated from the chancel by a fine stone screen, occupying three bays of the arcade. The small oak door to the chapel is made of 1in. planks, beautifully carved with open lattice-work in the upper part, and shields below in very low relief.

Obituary.

Mr. Cornelius Bagot, architect, of Manchester, died recently, aged 68.

Views and Reviews.

Gas Producers.

Gas producers are now in such general use that this book, consisting of hints to users, is welcome. The information is given in the shortest and concisest way.

"Working Hints for Suction Gas Producers," by A. Flurscheim. London: "The Gas & Oil Engine Record," price 1s. nett.

Modern Buildings.

We have already reviewed volumes 1 and 2 of this publication. The third volume, now before us, is divided into three parts—namely, (1) school and hospital planning; (2) the law of easements; (3) heating, ventilating and lighting. The promise of the earlier volumes seems to be sustained, the information offered being practical and concise, while a number of plans by well-known architects of model schools and other buildings are published. The details of fittings are particularly valuable. The plans and details of the British Hospital at Constantinople, of which Mr. H. Percy Adams, F.R.I.B.A., is the architect, are, we are glad to see, included in this volume; a charming perspective of the building is reproduced in colour, and various other coloured plates are included. The law of easements is dealt with by Mr. J. Bridges-Lee, barrister-at-law; the subject of gas fitting and gas lighting by Mr. W. Noakes; and electric lighting by Mr. H. Y. Margary. "Oil Gas" forms the subject of a chapter contributed by Mr. H. Luttrell Godden. The other chapters are anonymously contributed.

"Modern Buildings: their Planning, Construction and Equipment." Vol. III. Edited by G. A. T. Middleton, A.R.I.B.A. London: The Caxton Publishing Co., 84, 85 & 86, Chancery Lane, W.C., price 10s. 6d. nett.

Architects' Joinery.

The publication of a revised edition of this book, which was first issued some years ago, certainly seems to us to deserve the remark that it makes its appearance under false pretences. Mr. Batsford, who issues it, is recognised as a publisher of independent books, yet this is merely the catalogue of a trade firm. The title of the book would lead one to suppose it to be a general treatise on joinery. All the designs illustrated, however, are protected against infringement, and a price-list relating to the different plates is given away with the volume—separately printed it is true, yet evidently part and parcel of the book, because it is referred to in the "Foreword," which itself consists of an offer by the author to submit designs and estimates for joinery work, and a statement of the quality of the materials he supplies. We have no quarrel with the book as a trade catalogue. It is very well produced and many of the designs are good in themselves, and clearly illustrated by means of photographs from actual examples. For the most part the illustrations comprise mouldings and mantels, but there are also shown a few screens, doors and dado panellings.

"Architects' Joinery and its Ornamentation," by F. A. Fawkes. London: B. T. Batsford, price 5s. nett.

A Pocket-Book.

There is undoubtedly an opening for a good pocket-book for the building trades, and we were pleased to see that this book had been published; but we doubt, on closer inspection, if it will fill the want. The author says in his preface: "The work does not pretend to be a text-book on any particular building trade, but it does aim to supply a summary of the leading features in connection with the majority of them as has not hitherto been available, and which will, it is hoped, make it a valuable pocket or desk companion." —We think the book has missed its expressed aim, because there is no proportion observed between the parts of the subject dealt with. It is far too scrappy and, although a good deal of the information is useful in itself, there is a want of completeness and grasp about the whole book, which prevents it being considered an adequate work of reference. It is all very well as providing memoranda supplementary to other aid-books, but it is not all-sufficient in itself. It may not "pretend to be a text-book on any particular building trade," but it certainly often relapses into the text-book style. For instance, we find such trite remarks as the following :—

> A bricklayer is one who understands and can execute, in the best manner possible, the laying of bricks so as to build up the carcase of a building. Bricks may be termed artificial stone, and, being of a uniform size and easily obtained in any part of the country, they enable a building to progress more rapidly than an all-stone structure. Masonry, practically considered, is the art of hewing, shaping, and uniting stones for the various purposes of building. The term "mason" is derived from the French maison, "a house," and denotes a builder. Concrete floors should be light, strong, and able to resist fire. In addition to these qualities, materials must be used to counteract the cross-stress, due to weights placed on floors, in addition to the weight of the floor itself. A floor ought to obtain its support independent of the walls.

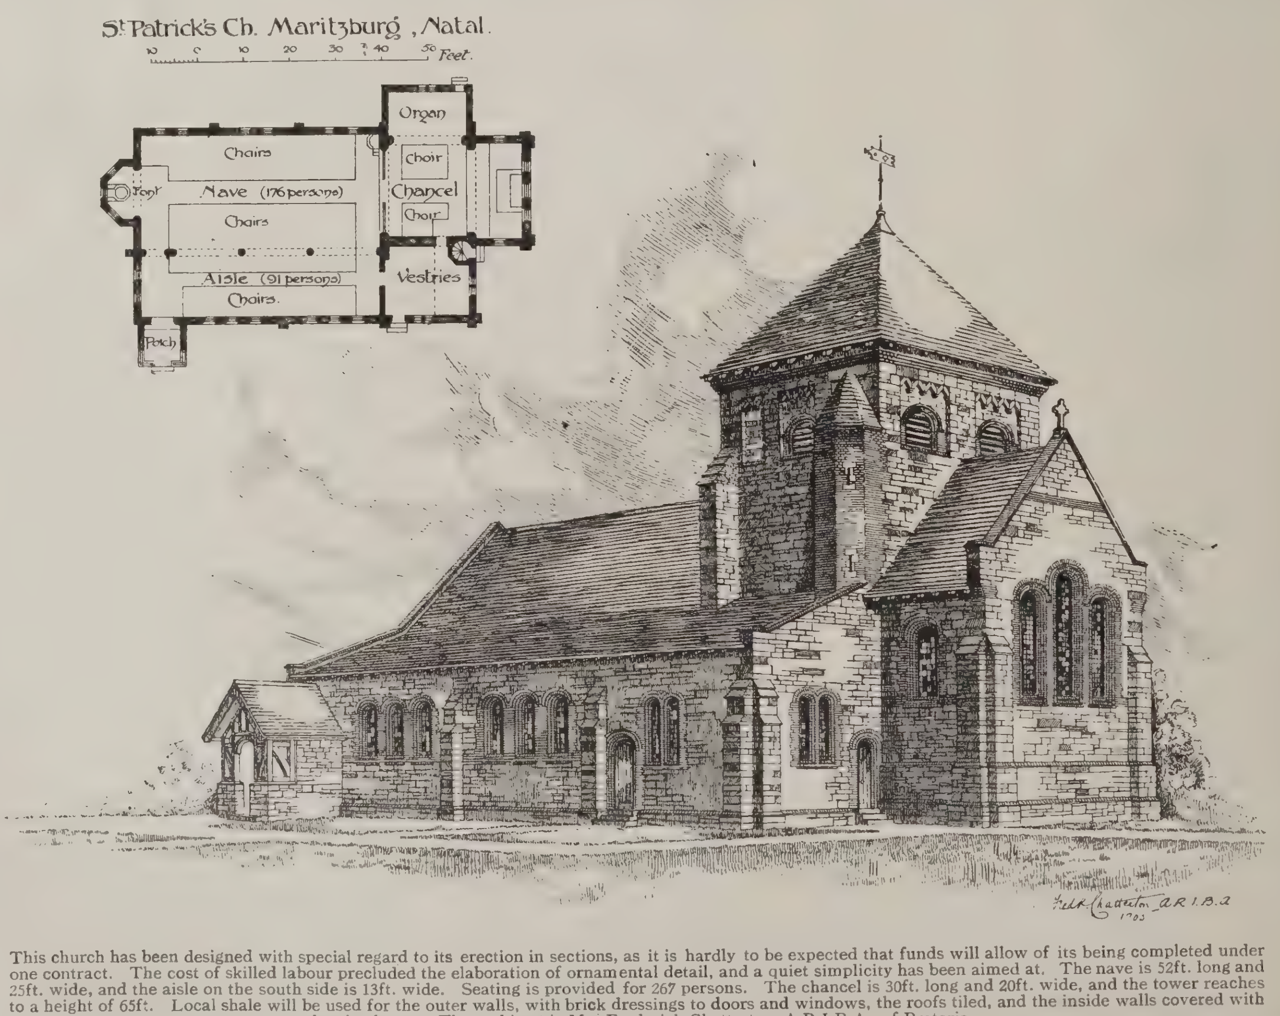
Such definitions as these are altogether out of place in a pocket-book, which is, surely, only supposed to be used as a collection of data and reminder to persons who have already studied the principles of the subject. The book collects together a good deal of information which it is easy to obtain, being found in the majority of pocket-books, such as weights and measures, mensuration, circumference and areas of circles, squares and cubes, logarithms, weight of pipes, strength of ropes and chains, stamp duties, tables of wages, &c. There is nothing to be said against such information; but, as it is to be found in existing books, it is obvious that republication is no distinction or reason for according the book a place; its claims must be based upon the novelty and usefulness of the other information it offers. This, however, consists of a summary of the British standard specification of Portland cement, the report issued by the Home Office on the cause and prevention of accidents in building, the ordinary kind of remarks and drawings about brickwork bond, setting-out of arches, forms of jointing and pointing, specially shaped and moulded glazed bricks, lists of stone and granite quarries, drawings of a few masonry details, the method of setting-out the entasis of a column, the way to enlarge mouldings, method of seasoning timber, bending moments and shear diagrams, joints in woodwork, the R.I.B.A. scale of charges, and so on. There is nothing particularly novel in all this, and we cannot see that it is treated at all informingly; in fact, we would prefer students to consult other works, as much of the information is erroneous, or does not convey the proper view. The book also contains extracts from the London Building Act and other building by-laws, the rules for the building trade of London, hints on restoration published by the Royal Institute of British Architects, the Boston code of professional ethics, and an abstract of the Workmen's Compensation Act, all of which information is easily gathered together and occupies the limited space in the book to the exclusion of information which would be more valuable. Finally the book contains tables on the various periods of architecture, which are altogether superfluous and, indeed, ludicrous. In this part, illustrations of the Orders are included without any figured dimensions or scale. The Doric Order of Vignola is printed upside down, and the others might have been also for all the use they are.

"Fowler's Architects' and Builders' Handbook." Manchester: Scientific Publishing Co.: price 2s. 6d. nett cloth; 3s. 6d. nett leather and gilt edges.

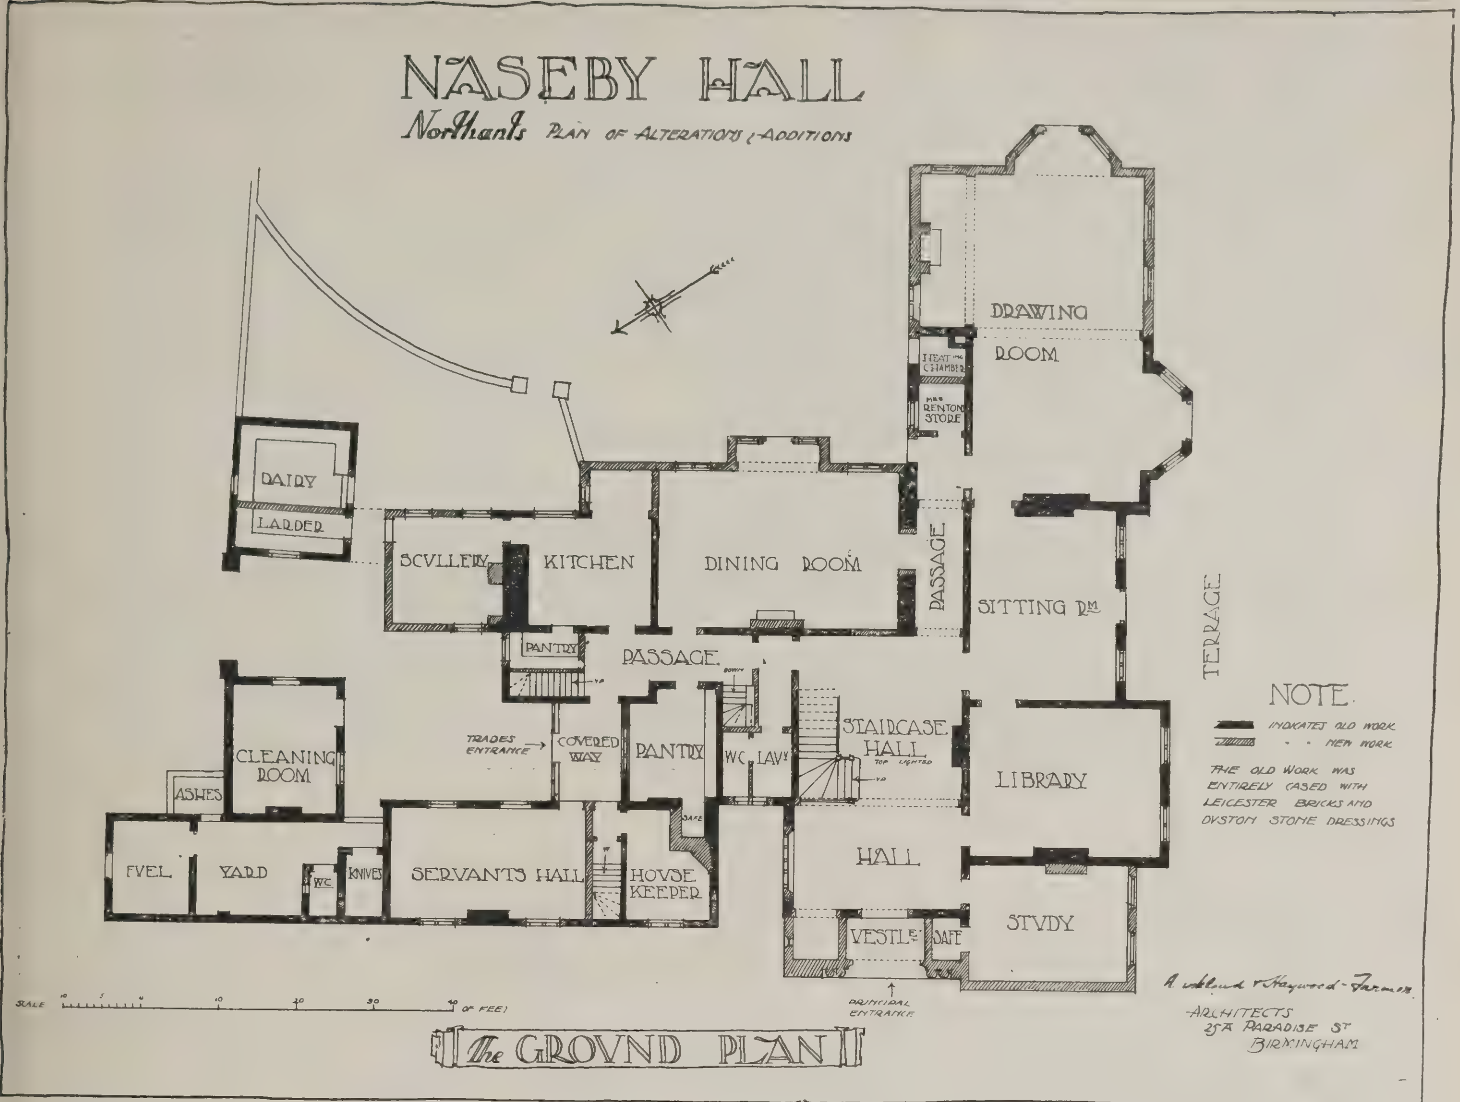
Hot-water Supply.

This book contains records of original research and remarks on the lessons to be drawn therefrom, which are deserving of careful study by all interested in the subject. Mr. Sayers, who is the lecturer on plumbing at the Municipal Institute, Belfast, fitted up for the instruction of his students a complete full-sized hot-water system, and by arranging the pipes differently, inserting glass tubes so as to show the flow of the water, and also thermometers at points to record the temperature, elicited much practical information and determined obscure points. In fact, Mr. Sayer has cleared up the whole subject very thoroughly, and his records of the experiments form most interesting reading, particularly as he has so plainly drawn the lessons to be learned.

"Experiments on Hot Water Systems," by A. Sayers. London: Sanitary Publishing Co., Ltd. Belfast: W. Erskine Mayne. Price 3/6 nett.



This church has been designed with special regard to its erection in sections, as it is hardly to be expected that funds will allow of its being completed under one contract. The cost of skilled labour precluded the elaboration of ornamental detail, and a quiet simplicity has been aimed at. The nave is 52ft. long and 25ft. wide, and the aisle on the south side is 13ft. wide. Seating is provided for 267 persons. The chancel is 30ft. long and 20ft. wide, and the tower reaches to a height of 65ft. Local shale will be used for the outer walls, with brick dressings to doors and windows, the roofs tiled, and the inside walls covered with asbestic plaster. The architect is Mr. Frederick Chatterton, A.R.I.B.A., of Pretoria.



Our Plates

The alterations and additions made to Naseby Hall, Northants, by Messrs. Buckland & Farmer, architects, of Birmingham, are clearly shown by the above plan, and by the perspective illustration given as a centre plate, so that there is hardly any need for any detailed description of the work. The old work was entirely encased with Leicester bricks and Duston stone dressings.

Notes and News

Municipal Flats.—Pond House, Pond Place, Chelsea, is a block of municipal flats just erected in the borough.

The New Central Criminal Court in Old Bailey, it is stated, will be ready for opening before the end of October.

The historic walls of Cadiz are being pulled down. It has long been the dream of the people of Cadiz to demolish these picturesque but useless walls, to make room for factories and modern buildings.

The Birthplace of William Wilberforce, an Elizabethan mansion in High Street, Hull, has been acquired by the Hull Corporation and converted into a museum, in which objects illustrative of the history of Hull will be collected. It was opened on Friday last.

Manchester School of Technology: Architects' Fees.—At a meeting of the Manchester Education Committee held last Wednesday it was resolved to allow 1,000 guineas in satisfaction of a claim by Messrs. Spalding & Spalding, the architects, as extra remuneration in connection with the new Municipal School of Technology.

The enlargement of the Paddington Town Hall, Harrow Road, rendered necessary by the growth of municipal work and an increased staff of officials, is now nearly completed. The alterations made include the provision of a spacious semi-circular council chamber, for the fitting and furnishing of which £3,000 has been voted.

New Church at Ross.—In the paragraph about this new church on p. 55 of our issue for August 1st it was stated that the oak screen was made by Mr. Clarke, of Hereford. This is not correct, for Mr. F. Dredge, of "Ye Antique Furniture Shoppe," Hereford, writes to say that he made the screen, and also the altar in the church.

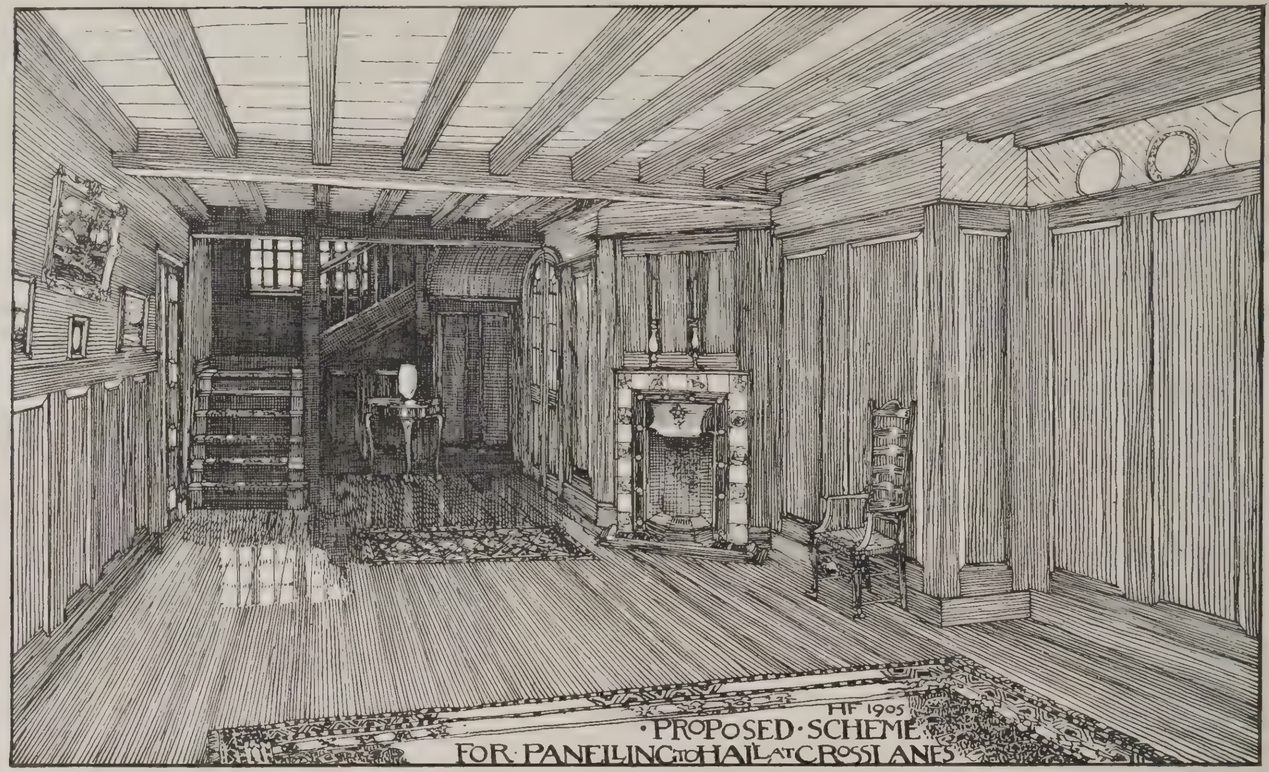
Another Garden City.—The Vale Farm, a beautiful well-timbered estate adjoining Pinner Road, Sudbury, near Wembley, has been acquired for the purpose of development as a garden city. The plans provide for the erection of a theatre and restaurant, but it is not intended that factories shall be built, as the site is to be utilised for residential purposes only.

For the Treatment of Pauper Lunatics an asylum is being completed at Bangour, near Edinburgh, at an estimated total cost of £300,000. The architect for the work is Mr. Hippolyte J. Blanc, R.S.A., of Edinburgh. The formal opening ceremony will take place in October. The various buildings are disposed over a large area, and everything is done to make the place look cheerful.

Contract for Rebuilding of Gloucester House, Piccadilly.—Messrs. Patman & Fotheringham, Ltd., of 100 and 102, Theobald's Road, W.C., have secured the large contract for the rebuilding of Gloucester House, Piccadilly, W. (the late Duke of Cambridge's residence), for J. J. Duveen, Esq., of Messrs. Duveen Bros., Bond Street, W. The architects are Messrs. Collcutt & Hamp, Bloomsbury Square, W.C.

The Cathedrals of England and Wales.—Mr. T. Francis Bumpas has now completed his history of the cathedrals of England and Wales, and the third and final volume will be published by Mr. Werner Laurie, Clifford's Inn, in a week or two. The contents include Lichfield, Gloucester, Rochester, Carlisle, Oxford, and a number of the minor cathedrals. The book is illustrated with 32 plates in two colours.

King's College Hospital.—Half of the £300,000 required for the erection of the new hospital at Camberwell has now been subscribed, and in all probability the new building will be commenced before the end of the present year. The out-patients' department is to be erected first, and the wards and administrative section will follow as further funds permit. The architect is Mr. William A. Pite, F.R.I.B.A., whose design was selected in limited competition.



HF 1905
·PROPOSED·SCHEME·
FOR·PANELLING TO HALL AT CROSSLANES

NIVEN, WIGGLESWORTH & FALKNER, ARCHITECTS.

This scheme has been carried out by Messrs. H. & E. Dyer, of Alton, with old panelling supplied by Mr. H. J. Baker, the owner of "Crosslanes," which is a house at Frensham, near Farnham, in Surrey.

IRISH NOTES.

Architectural Home Rule for Ulster.

Under this heading in its current issue "The Irish Builder and Engineer" deals with the breaking-away of the Ulster Society of Architects from the Royal Institute of the Architects of Ireland. Our contemporary says:—"It is but a few years ago that the Irish Institute, at the request of a number of its Ulster members, consented to the formation of a branch society, affiliated to itself, and known as the Ulster Society of Architects. During the comparatively short time it has been in existence, the younger body has doubtless shown considerable vigour and energy, much of which it owes to the zeal of the ex-president, Mr. W. J. Gilliland. It has initiated classes for students, many of whom have successfully passed the British Institute examinations, and has generally interested itself in the important question of architectural education to an extent that favourably compares with the belated activity of the senior institution. On broad professional grounds it is, therefore, most regrettable that this vigorous body of architects in the North should seek to go its own way and withdraw what might prove, if properly applied, a most helpful influence in the counsels and actions of the Irish Institute. It is still more lamentable that the division should occur at the present moment when the registration question is under consideration, and a proposal to found a chair of architecture at Trinity College, and the initiation of a scheme of Irish examinations, are forming subjects of discussion between the R.I.A.I. and the Irish Architectural Association. There seems in this country at present to be a general desire to call for a higher recognition of architecture as a profession, and to raise it from the somewhat debased position it has held in the public eye for the last quarter of a century. To achieve the required results, unity is essential, and we must confess that the action of the Northern society could scarcely have occurred at a more unpropitious time.

"From a narrow aspect there is little question that the Irish Institute, as a society, will benefit by the dissolution. Since the formation of the Northern body, the latter has arrogated to itself functions which should, in equity, have been left to the parent institution; and far-reaching resolutions have been passed of major importance —*e.g.*, the 4 per cent. resolution, and that dealing with building contracts—without any prior reference to the R.I.A.I. Indeed, we know that the senior society has on many occasions felt itself hampered by the hostility which the Ulster Society has endeavoured but thinly to disguise.

"It may be assumed that the Ulster Society will now seek direct affiliation to the British Institute, and we expect no more than a dignified protest from the Irish Institute at the methods by which the dissolution has been achieved. We fear the split has gone too far for other counsels to prevail, but it is difficult to prophecy to what extent the R.I.A.I. will be numerically weakened. There is no doubt, however, that its remaining members will be more firmly knit together, now that a cause of dissension is removed, and we anticipate that, pursuing its present policy of dealing with architectural matters, and by the infusion of a little more energy into its actions, the Royal Institute of the Architects of Ireland will lose little, if any, of its influence as the representative body for the profession in this country."

A Criticism of the Belfast City Hall.

In the same issue of the "Irish Builder" there is the following criticism of the huge new City Hall which has just been completed at Belfast, from designs by Mr. A. Brumwell Thomas, of Westminster, whose design was selected in competition more than ten years ago:—

"Our Belfast correspondent . . . drew attention to the faultiness in artistic principle of the barrel-roofed portes-cochère, or porticos, as the case may be, which embellish more than one facade of the new building, as blemishes on the general effect of the design; and he also deprecated the meandering walks, amidst indiscriminate patches of grass lawn, which disfigure the surrounding ground. We have since looked through some of the photographs, and we cannot help agreeing with our correspondent's strictures. We have not been grudging in our own praise of this truly noble municipal edifice . . . but we look forward to the time when the porte-cochère and the protruding portico will be removed. They mar the noble lines of the main building. The walks are beneath criticism, and it is doubtful that the architect could have been consulted in reference thereto. The only defect which strikes us in the main facade (always excepting the lack of the base, or plinth, alluded to by our Belfast correspondent) is the somewhat abrupt way in which the line set by the tall circular windows of the first floor ranges with the smaller windows of the end wings: this, we fancy, leads to some loss of breadth and dignity. The problem was a difficult one, and the result realised has so greatly exceeded anything that could have reasonably been expected that the architect need not cavil at these few comments. The effect of the central statue is, however, far from pleasing, blotting out as it does the chief entrance. The want of a great and imposing central doorway will be by some regarded as a loss; but the tendency, one might say the besetting weakness, of English architecture has ever been to lose sight of the value of this ennobling feature, of which such important use was formerly, and still is, made by French architects."

Enquiries Answered.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Sketching Tour in Wilts, Gloucestershire and Berks.

FARNHAM.—LISAK writes: "Will you please advise as to a cycling tour through Wiltshire, Gloucestershire and Berkshire. What should I see, sketch and measure in these counties as likely to be of help to me in working up for the Intermediate Examination of the R.I.B.A.?"

The following list gives the more important remains of domestic work in Wiltshire. *Fourteenth Century*:—Stanton St. Quentin; Place House, Tisbury; Woodlands, Mere; Barton Farm, Bradford; Wardour Castle. *Fifteenth Century*:—Great Chaldfield; Norrington; Pottern; Salisbury, houses in Close and City; South Wraxall (remodelled in the reigns of Henry VIII., Elizabeth and James I). *Sixteenth Century and later*:—Bradford, Dukes' House; Charlton, Corsham, Littlecot, Longleat, near Warmington; Longford; Wilton. Monastic remains will be found at Malmesbury in the form of an abbey with its conventual buildings. Laycock retains its fifteenth-century cloisters and its thirteenth-century chapter-house and kitchen. Bradenstoke has some excellent remains of domestic buildings of the fourteenth century. The churches of St. Mary, Crickdale, and St. Mary, Devizes, which are chiefly Perpendicular in style, possess fine, rich, lofty towers. Cruciform churches will be found at St. Sampson's, Crickdale; Bishop's Cannings, St. John's, Devizes; Purton, Downton, Heytesbury, Great Bedwin, Wanborough. Pyramidical bell towers are to be seen at the churches at Acton, Turvil, Sutton Benger, Corsley, Biddestone and Great Chaldfield. Stone spires are to be found at Chilmark; St. Martin's, Salisbury; Trowbridge, Chippenham, Box, Purton and Bishop's Cannings. There is good Norman work at St. John's and St. Mary's, Devizes; Corsham and Preshute; and Transitional work at Ogbourne and in the nave of Great Bedwin. At Britford and North Barcombe is work which has a Saxon appearance. Salisbury Cathedral, of course, is unrivalled as an Early English example on a large scale. Bishop's Cannings and Pottern have fine churches in the Early English style in a very well preserved condition. Very good work of the same period is to be found at Purton, Downton, Ambresbury, St. Sampson's (Crickdale), Collingbourne-Kingston, St. Martin's (Salisbury) and in the chancel of Great Bedwin. There is good Decorated work at St. Sampson's (Crickdale), where the windows are particularly beautiful. There is very little fourteenth-century work in this county. Good vaulting is to be seen at Devizes, Bishop's Cannings, Urchfont and Marlborough. Gloucestershire is particularly rich in abbeys. They were: Gloucester, Llanthony, Tewkesbury, Cirencester, Hayles, Flaxley, Kingswood, Winchcombe and Bristol. The churches most deserving attention are Almondsbury, Berkby, Bibury, Bisley, Buckland, Campden, Charlton Kings, Cheltenham, Cirencester, Cleeves, Deerhurst, Dytham, Elkstone, Fairford, Gloucester, Henbury, Highnam, Kemeston, Lechlade, Leonard Stanley, Marshfield, Minchinghampton, Naunton, Newland, Northleach, Ozleworth, Painswick, Pucklechurch, Rendcombe, Redcliffe, Rodmarton, St. Briavels, Stow, Sudeley, Slimbridge, St. Augustine's, Tewkesbury, Thornbury, Tiddenham, Winchcombe, Wooton-under-Edge. Its priories subordinate to foreign monasteries were Beckford, Brimpsfield, Deerhurst, Horseley, Minchinghampton and Newent. Further information concerning the Gloucester district will be found in the "Enquiries Answered" column of this journal for July 4th last. In Berkshire there are several remains of good castellated work. Of these Windsor Castle is the finest. A fragment of a tower with a fine oriel window is to be seen at Wallingford, at Dorrington there is a picturesque gateway, and at Shillingford some chimneys. The oldest manor house in Berkshire is at Appleton, near Abingdon, supposed to be *temp.* Henry II. East Hundred retains its thirteenth-century chapel. Tyfield has a solar in a very perfect state, and the hall has Decorated doorways. There are remains of Tudor houses at Wytham, Sutton Courtenay, near Abingdon, and at Little Shefford, near Newbury. The beautiful old timber mansion of the Norreys family at Ockswells and Ufton Court, the home of Pope's "Arabella Termor," are still in existence, both being used as farm-houses. Shaw House, near Newbury, is a good specimen of the Elizabethan period. The principal monastic remains are those of Abingdon, where the gatehouse and some portions of the chapter-house still remain, and Reading, where the abbey mills and other small portions are still standing. The doorway and tower of Bisham are built into a beautiful but later manor house. Small traces of a Benedictine monastery are left at Hurley, and the church of the Grey Friars at Reading has been restored. Of the churches of Berkshire, Avington is a very perfect specimen of early Norman work. The little church of Padsworth, though much injured, presents some good Norman details. Uffington has a fine Early English church. Shottesbrooke is a specimen of Decorated work; and St. George's Chapel, Windsor, is Perpendicular. The churches of St. Helen's, Abingdon, Wantage, Faringdon, Bisham and Sonning are of much interest. Welford and Shefford have ancient round towers. Tidmarsh and Pemenham have circular apses. Fonts are to be found at Appleford, Eaton-Hastings, Finchampstead, Purley, Great Shefford, Welford and Clewer—Norman. Englefield, Hatford, Wantage, Childrey, Long Wittenham and Woolhampton—Early English. Ardington and Buckland—Decorated. Chievelley, Compton, Beauchamp, Denchworth, Hogbourn, Hurley, St. Lawrence and St. Mary, Reading; Steventon—Perpendicular. Glass of fourteenth-century date is to be seen at Basildon, Brightwell, Hogborn, Long Wittenham and North Moreton; and of fifteenth-century date at Titchcombe Regis, Shillingford, Sutton-Courtenay and St. George's Chapel, Windsor. Tombs of the thirteenth century are to be found at Cumnor and Didcot; of the fourteenth century at Aldworth (very remarkable), Hatford, Sparsholt (wooden effigies), Sonning and Wantage; and of the fifteenth century at Englefield, Fyfield, Windsor and Little Wittenham. Brasses are to be seen at Blewbury, Bray, Childrey, West Hanney, East Hundred, Lanbourne, Shottesbrooke, Wantage, Windsor and Little Wittenham.

You had better select one or more examples in accordance with the R.I.B.A. regulations and measure them up and plot them — if time permits — on the spot. Sketch and see as much as you possibly can according to the time at your disposal. Space does not permit a list of addresses of persons to whom you should apply for permission to sketch and measure, but you will probably have no difficulty in obtaining permission on the spot. If there are any places you are particularly anxious to measure, the addresses of the owners will be found in Kelly's Directories of the various counties. H. Y. M.

Buildings to Measure at Bournemouth, Aberdare, Shepton Mallet, Sudbury, and Bedford.

CARDIFF.—PROBATIONER writes: "What places and buildings in the vicinity of Bournemouth are worth a visit for sketching, and is it necessary to obtain permission beforehand to visit?"

St. Peter's Church, Bournemouth, is worth a visit. It is usually considered the most successful work of Street. Christchurch is perhaps the most interesting place in the neighbourhood of Bournemouth. It possesses two churches. The church on the bank of the Avon is principally Norman and Perpendicular. The outline is somewhat disappointing. The gigantic Early English north porch, the rich circular north turret at the east angle of the north transept, and St. Michael's loft above the Lady chapel should be especially noted. The building forms one of the best examples of the union of a monastic and a parochial church. Topley Church contains work of the Early English and Perpendicular periods. The names of persons to whom you must apply for permission to sketch will be found in Kelly's Directories of the counties. Permission is rarely necessary, except in the case of private residences.

ABERDARE.—SET SQUARE writes: "Are there any buildings in or near the following towns suitable for measuring for the R.I.B.A. Intermediate Examination: Aberdare, Shepton Mallet, Somersetshire, and Sudbury in Suffolk?"

At Aberdare there are two churches, of which St. Elvan's is a handsome Decorated building. There is very little else in this neighbourhood. In the neighbourhood of Shepton Mallet are the cathedral of Wells and Glastonbury Abbey. The church of Shepton Mallet is a very fine example of Early English work, with one of the most beautiful timber roofs in the country, and in the chancel there is a very fine Early English piscina. This roof contains 350 panels, no two being alike. In the market place is a cross worth noting, erected 1500 and restored 1841. The village of Croscombe possesses an Early English and Perpendicular church and a cross. The church has a stone spire—an unusual feature in this part of the country. The arcades are Perpendicular and the south door is Early English. The rich battlements should also be noted. The church contains an extraordinary amount of fine woodwork in the form of seats, bench-ends, &c., among which the truly magnificent cinque-cento pulpit, bearing Bishop Lake's arms and the date 1616, and the chancel screen, rising nearly to the roof of the church, deserve special notice. The roof of the chancel is of the same date as the pulpit. The belfry has a fan vault. Croscombe is full of old houses, of which the village inn is of fifteenth-century date and deserves attention. It has a good bay window with a carved stone ceiling, good fireplaces and panelled ceilings to the chief rooms. Good churches are to be seen at Dinder and Pilton. Sudbury has three churches—All Saints', St. Gregory's, and St. Peter's. All Saints' is Perpendicular with a Decorated chancel with a very good roof and screen work and an oaken pulpit dated 1490. St. Gregory's and St. Peter's churches are Perpendicular. The Perpendicular gate of St. Gregory's College is still standing. At Borley is a church containing a fine Elizabethan monument. Twinstead Hall is a large Elizabethan mansion. Bure St. Mary possesses a church which is chiefly Decorated in style. Churches will also be found at Mount Bures, Little Horkesley, Middleton and Beauchamp Walters. The names of the persons to whom you must write for permission to sketch will be found in Kelly's Directories for the counties. Permission is rarely necessary, except in the case of private residences.

CLECKHEATON.—SPEN writes: "Please name a few old and new buildings round about Bedford, Dunstable and Biggleswade suitable for measured drawings. Also, where must I apply for permission to visit Hatfield House?"

At Elston, one and a half miles south of Bedford, are a church and some Renaissance remains of a priory. A little ancient work is to be seen at the Churches of St. Mary and St. Peter, Bedford. At Clapham, one and a half miles north of Bedford, is a church dedicated to St. Thomas of Canterbury, with a Saxon tower and an Early English nave and chancel (restored by Sir Gilbert Scott), and possessing a fine monument attributed to Grinling Gibbons. At Biddenham the Church of St. James contains work of the Norman, Decorated and Perpendicular periods and has a curious hagioscope on the north side. St. Owen's Church, Bromham, has a Decorated arcade and a Perpendicular tower. Kempston Church has Norman chancel and tower arches, Decorated nave arcade and Perpendicular windows. Willshampstead Church contains Early English, Decorated and Perpendicular work. At Biggleswade is the Perpendicular Church of St. Andrew with an earlier south door. An Early Decorated church is to be seen at Eyworth. Langworth contains a good Decorated and Perpendicular church with a fine rood screen. The Church of St. Peter at Arlesby contains Early English and Decorated work and a Tudor chapel. St. Mary's Church, Stotford, is chiefly Decorated, but the nave is Early English. Some curious mural paintings and carved work are to be seen here. The Perpendicular church of St. Leonard at Old Warden has been fitted with oak carvings and various enrichments, brought from various parts of the Continent, and is well worth a visit. At Cardington the Church of St. Mary has a good nave arcade, a central Early English tower, and a Perpendicular chancel. All Saints' Church, Caple, is a fine example of Perpendicular work. At Dunstable are some fine remains of the Priory Church of St. Peter and St. Paul. The nave and great portals are Norman, the west front is Early English, the north aisle and upper part of north-west tower are Perpendicular. At Totternhoe is the Perpendicular church of St. Giles. The church of St. Mary, Eaton Bray, contains Early English work (nave, arches and font) and Perpendicular work (chancel, aisles and clearstory). The church of St. Michael, Houghton Regis, is chiefly Decorated, and in the south aisle is a very good Perpendicular tomb to Sir John Sewel. At Luton is the very fine church of St. Mary, of which the tower is partly Decorated and partly Perpendicular, and the nave, arcades and transepts are Decorated with some Early English portions. The addresses of persons to whom application should be made for permission to sketch will be found in Kelly's Directories of the counties. Permission to sketch is very rarely required except when it is desired to sketch private residences.

H. Y. M.

Wilstead.

CAVERSHAM.—C. B. W. writes: "Is there any building within about eight miles of Reading suitable to measure for the R.I.B.A. Intermediate Examination?"

See answer to enquiry under the heading of "Tours in Berks, Wilts and Gloucestershire," on preceding page.

Scales.

PORT TALBOT.—W. J. J. writes: "Does any book deal solely with scales, giving details how to read them?"

We do not know of one.

Portland Cement Tennis Court.

PORTLAND writes: "A Portland cement tennis court (100ft. by 50ft., laid to slight fall towards centre channel in the width of the court) formed with 6-in. cement concrete bottom, a rendering coat about ¾in. thick of cement and sand, finished with a setting coat average ⅛in. thick of neat cement, was laid and completed about the end of September last. The setting coat almost immediately began to crack, and by the end of the winter about ⅓in. of the setting coat had flaked off and some of the rendering was also cracked, but the concrete had not settled. The whole court was thoroughly repaired with specially selected cement at the end of May and has again cracked in several places. What is the cause of this, and how can a permanent smooth surface of cement be assured? (Samples sent.)"

From the samples sent we think the primary cause of failure has been the application of the cement and sand coat after the bottom layer of concrete had become dry. It should have been put on when green. The final finish of neat cement, about ⅛in. thick, had no particular advantage, and as good a surface could have been obtained by trowelling the surface of the intermediate layer. Sand is not a particularly suitable aggregate to use for a surface coating unless used with care and knowledge. It would be better, in an ordinary way, to use fine granite chippings. If sand is added, it should be only for the purpose of filling the interstices in a large aggregate. To get the finishing coat to adhere to the under-surface it should be picked, carefully washed free from the slightest trace of dirt, and kept soaked with water for some days. The top coat should be of greater thickness than ¾in.—say 1½in., and proportioned 1 to 1. After the surface has set, and while yet green, it should be covered with a layer of sand, which should be kept continually wet by means of a hose for a week at least.

Scottish Measurers for English Work.

AIRDRIE.—FOX writes: "I am a measurer, trained under the Glasgow mode of measurement. Would I have any difficulty in obtaining a situation in a quantity surveyor's office in London? I have ten years' experience and hold good testimonials."

The difference between the Glasgow mode of measurement and that of London is so great that it is extremely doubtful whether you would succeed in obtaining a situation in a London quantity surveyor's office.

W. E. D.

Timber Calculator.

TREDEGAR.—M.J.M. writes: "Please let me know whether there is a useful and concise timber calculator."

The best book for your purpose is "The Practical Timber Merchant," by W. Richardson, comprising useful tables for all purposes connected with the timber trade. The price is 3s. 6d. It can be obtained from these offices, or from Mr. B. T. Batsford, 94, High Holborn, W.C.

THE GLASGOW SCHOOL OF ARCHITECTURE.

The syllabus for the next session of the Glasgow School of Architecture, which is under the direction of a joint committee representing the Glasgow and West of Scotland Technical College and the Glasgow School of Art, has just been issued. There are two courses of study, one for a diploma—strongly recommended to students wishing to qualify as architects—and the other for a certificate, of lesser requirement, and arranged for evening students who cannot give the time in the day required for the diploma course. Special courses of study have also been provided: (1) for architectural students who, in exceptional circumstances, take some of the classes only, and (2) for students of the painting, modelling and decorative art classes of the School of Art, and for students in various departments of the Technical College who require some architectural instruction (measurers, builders, engineers, &c.). Both diploma and certificate courses prepare for the examinations of the Royal Institute of British Architects. The next term begins on September 25th at the Technical College and, for some subjects, on September 6th at the School of Art. The Director is Professor Eugène Bourdon, B.A., A.D.F.G. In the School of Art, architectural design is under the direction of Mr. Alex. M'Gibbon as professor, with Mr. Walter R. Watson as instructor, while in the Technical College these two positions are filled respectively by Prof. Charles Gourlay and Mr. James S. Boyd.

A New Roman Catholic Church at Wellington, Salop, has been erected at a cost of £4,500, accommodating 350 persons. Mr. Myles Morley was the architect up to last Christmas, after which date Messrs. E. Kirby & Sons, of Liverpool, supervised the work. Mr. W. Skellorn, of Stafford, was the builder.

Henley Bridge, erected in 1786 at a cost of £10,000, is in a dangerous condition, and a diver is now daily engaged building up a bulwark of cement-concrete bagging to protect the exposed sub-structure. Meanwhile the Corporation is considering the best method of remedying the defects in the superstructure.

Trade and Craft.

A Builders' Price-List.

Messrs. Young & Marten, Ltd., the well-known builders' merchants of Stratford, London, have just issued a pocket price-list for the building trades. It is thoroughly up to date, and to ordinary members of the building trade will prove most valuable. The prices are given at lowest nett rates, and the selection embodied is one in much demand for present-day villa property. A copy will be sent free on application to Messrs. Young & Marten.

Decorative Cast-Iron Work.

The Carron Company is one of the oldest ornamental ironfounders in the kingdom, having been incorporated by Royal Charter in 1773. Many of the designs which the firm produced more than a century ago are most admirable specimens of art, and it is a stroke of luck that we are still able to obtain these patterns from the company, who have just issued a new catalogue of a good many of the designs in firegrates executed in the early period of their history. The designs are from original carvings done at Carron more than 100 years ago by William and Henry Haworth (students of the Royal Academy during the presidency of Sir Joshua Reynolds), as well as other eminent artists. Their work clearly shows that they were influenced by Flaxman, the brothers Adam, and other artists of the period, who stamped a distinctive style upon their generation. These carvings are careful and masterly studies, perfect in the smallest detail, so that it is a pleasure to study them closely. Whilst the old-time style of these grates has been strictly adhered to, their general construction has of course been modernised to meet present-day requirements. The good taste displayed by the Carron Company in giving the public and the architectural profession the chance of obtaining such artistic productions deserves every support, and we can only hope that their enterprise may be financially remunerative. The illustrations published in the catalogue should be carefully looked at by anyone requiring good firegrates, and it would be well to keep a copy for reference. The catalogue can be obtained from the works at Carron, Stirlingshire, or from the London offices of the firm at 15, Upper Thames Street, E.C., or 23, Princes Street, Cavendish Square, W., where there are showrooms that would well repay a visit. The glories (!) of the Victorian era are fast disappearing, and we have instead either replicas of an earlier age when better taste prevailed, or designs frankly modern and expressive of to-day. For that change all architects must be profoundly thankful.

"Velure."

"Velure," the well-known paint manufactured by Messrs. C. Chancellor & Co., of 13, Clerkenwell Road, London, E.C., is certainly remarkably elastic. One coat applied to a piece of tin with an ordinary brush will not crack, peel, blister or fade, even if the tin is bent in all directions, placed in boiling water, or exposed to frost. It is claimed that "Velure" retains—far longer than other paints—a perfect surface, free from flaws or cracks. It is, therefore, a most sanitary paint, and easily kept clean. It is far better to use a ready-made paint manufactured by a specialist firm who have studied the chemistry and physics of the subject than to rely upon the ordinary mixture by a journeyman painter. "Velure" has come into some considerable use. Obviously it offers advantages both in economy and durability. It requires no admixture of oil, turps, dryers, &c. If it is desirable to thin it, a special "Velure thinner" is supplied by the manufacturers, who also produce "Stripso," one of the best known and most efficient paint-removers on the market. With "Stripso" all that is necessary is to spread a coat of it evenly over the surface, with a fibre brush for preference (ordinary hair or bristle brushes are liable to be ruined unless carefully rinsed after use). The coat is then left on until the paint, varnish or enamel is destroyed. The time taken to do this will vary according to the number and age of the coats to be removed. "Stripso" also removes rust, grease and smoke stains, and, diluted, will serve to clean dirt from paint without injury to the latter.

A New Radiator.

Messrs. Arthur L. Gibson & Co., of 19, 20 and 21, Tower Street, Upper St. Martin's Lane, London, W.C., are the agents for several specialities of American invention which form an everyday feature of practice in the United States. We have already referred to the Kinnear fireproof roller shutter, for which Messrs. Gibson are the agents, and, therefore, need not deal with this again. But the firm has recently introduced a new pressed radiator made by the Kinnear Co. which we now desire to describe. The feature of this radiator is that all joints and connections are machine-made, being formed by dies and machinery specially prepared for the purpose. Thus each joint is absolutely accurate and secure: each joint is also so locked and seamed together that it is impossible for it to part except under excessive pressure. After the radiator has been completely built it is immersed in a molten metal composition, which coats every particle of the radiator, not only inside but outside. This coating being applied after the construction of the radiator, it is never disturbed in any way, and consequently forms a coating which is absolutely impervious to the action of alkaline or acid waters, and, further, fills every seam or joint which may not have been tight prior to the immersion of the radiator. It is important to bear in mind that this coating is not applied until the radiator is completely built, so that there is no breakage of the coating at bending points, such as is common with galvanized iron. The application of this coating increases the thickness of the wall of the radiator to between 17 and 18 U.S. gauge. Each radiator is tested to a hydraulic pressure of 35lbs. to the sq. in. before shipment. Kinnear radiators contain $9\frac{1}{2}$ Imperial gallons of water per 100 sq. ft. of radiation. Cast-iron radiators contain $18\frac{2}{3}$ Imperial gallons per 100 sq. ft., or almost twice as much. Thus, in the Kinnear radiator, as compared with cast-iron radiators, one-half the amount of water or steam is exposed to the same radiating surface. It follows that the circulating medium of steam or water cools more rapidly and the heating units pass more rapidly into the air. From the qualities of the iron entering into the construction of the radiator and the application of the coating after its construction, its durability is unquestionable. Carbon and manganese largely enter into the manufacture of modern steel. Carbon thus used will find free air regardless of how the steel may be coated, and in finding free air it causes the metal to pit, or small pinholes to form. It is because of this particular action that modern steel is presumed to be non-durable. In Kinnear radiators carbon and manganese are absolutely negative quantities. These radiators should even exceed the durability of cast-iron radiators in which the sections are put together with steel push nipples. There is ample evidence of sheet metal being used for radiating purposes for various periods of time up to 50 years. Kinnear radiators weigh 2lbs. to the sq. ft. when boxed ready for shipment; unboxed their weight is about $1\frac{3}{4}$lbs. per sq. ft.; the weight of cast-iron radiators averages $7\frac{1}{2}$lbs. per sq. ft. In Model "K" (shown by the section given above) twice as much radiation can be obtained in the same floor space as with cast-iron. The pipe connections are made from malleable iron and are true and tight. Fig 1 illustrates a section of the Kinnear radiator, while Fig. 2 shows the section in comparison with a cast-iron section.

BERLIN, VIENNA, ST. PETERSBURG.[*]

A Criticism.

Berlin was a very unassuming business city till after the Franco-Prussian War, for it was with the milliards extracted as war indemnity from France that the Imperial Government set about adorning its capital. The palace and the old Brandenburger Thor, at the entrance to the park, gave the cue to the city improvements commission; and the great boulevard known as Unter den Linden connects the palace with the park. A glance at this quarter of the city shows how active the authorities have been during the last thirty years; for the "Prussian Diet," the "Reichstags gebäude" or Imperial Parliament House, the Museum and Picture Galleries, and the Cathedral, are all modern; as are also the University buildings and technical schools, which, under so paternal a Government as that of the Hohenzollerns, may well be classed as official. These buildings need not detain us long. They are all externally well built and ably planned. They all lack to my mind the highest qualities of architecture. It is remarkable that the Teutonic temperament, with all its intense sentimentality, extreme earnestness and enormous vigour, fails so conspicuously in the arts. The essential coarseness of fibre in the German character permeates German art. The natural graces of the national character, the kindliness, the sympathy and the culture seem strangely enough to fail to find expression in their art, and particularly in their official art, which is somehow always imbued with the bombastic swagger of the jingling spur and the mailed fist.

The intemperate swagger of German heraldic decoration has pervaded the Denkmaeler, or monuments, with which a keen-sighted Government has adorned the city and advertised the virtues of the Imperial house it serves.

Opposite the Palace is an equestrian statue of the grand old Emperor William, backed by a colonnade and surrounded by lesser groups. The whole conception is in the grandiose spirit introduced into architecture and sculpture by Michael Angelo and elaborated under Louis XIV. It is art of the kind which supplies all the needs of the beholder—a great banquet, if you like, and you must taste it all. Nothing is suggested and nothing is veiled in mystery.

Then again, in that splendidly kept park, the Thiergarten, where, in order that the green carpet may reach to the very roots of the noble trees, different varieties of grass are carefully grown, we have an all but grotesque exhibition of imperial pride.

The Kaiser's Statues.

Leading from the most blatant of all monuments of victory, which celebrates the Franco-Prussian War, we find a noble avenue lined on one hand with a set of monuments illustrating the long line from which the Emperor springs. Now, many of these ancestors were very ordinary princelings, and some were quite nonentities, while the great Frederick and the old Emperor William were men of international scale. I suppose the fact which the designers wish to express is that all these persons were equally great, and mainly great because they were ancestors of the Kaiser. Anyhow, they all have equal honour done them in a series of designs in various styles, all of a size and all of one scheme. In the focus of a raised semicircle of white marble stands the ancestral prince, while on the dies of the balustrade behind him are found busts of his two chief advisers. The national passion for order is well evinced in this absurd scheme, for if the old Emperor William, Moltke and Bismarck make a good trio, it does not follow that the local nonentities of Prussian administrators in other periods deserve recognition at all. This is not the way to express history in art—one page to the man: it is neither good history nor good art, and the chief interest to a designer is to note the cold, scholarly ingenuity with which something of the decorative method of many centuries has been applied (I use the word "applied" advisedly) to a Greek semi-circular garden seat that focuses on the back of a Kaiser's ancestor, which appears of absorbing interest to the two henchmen behind.

Vienna's Boulevard.

Vienna is the centre of fashion for Eastern Europe, drawing to its mighty heart all the rank and style of not only the Austrian nations, but of English, German, Polish, Russian, and Balkan. This old capital city has been cleverly and nobly remodelled by wise official care. The original town is now enclosed by a car track, instead of a wall, and on each side of this main circular route we find noble spaces and parks with fine groups of public buildings. As this great boulevard wheels gradually around, we are saved the extreme regularity and monotony which characterises the great Commonwealth Avenue of Boston. Interminable boulevards are, to my way of thinking, akin to nightmares. The sense of helplessness one feels on looking both ways down a street which vanishes to the horizon may be impressive, but it is not comforting, if one has to get to one end of it in a hurry. Axial planning has become too axiomatic with the T-square designers of modern cities, and I think such a system as that of Vienna, with its noble axial groups of buildings set picturesquely about an ever-turning boulevard, should get more attention than it has yet got. Vienna is one of the most impressive capitals in the world. Nowhere has a sense of dignified luxury and pleasurable pomp been better expressed in architecture. The buildings themselves are not very striking—just the ordinary civilised European Classic; but the massing and the disposition are unexcelled.

Petersburg—A City of Brick and Plaster.

St. Petersburg, or Petersburg, as those who have lived there call it, differs from the other European capitals in this, that it was a city laid out and planned in modern times. In 1702 it was a swamp with a Swedish fort overlooking the river. The city rose at the command of Peter the Great, and the magnificent lay-out of the plan was developed under Catherine II., whom I regard as the last of the great Royal builders of Europe. Petersburg is a city of brick and plaster. The Classic Palladianism of its public buildings is only skin deep and requires continual patching and painting. The street architecture is tinted in the cheeriest colours, pink, yellow, and pale green being the favourites; but blue and chocolate are often met with. There is thus not much in the way of nobility or dignity in the architecture, and the charm of the place depends chiefly on the magnificent scale both of the buildings and the streets, and the skilful lay-out of the city as a whole. To my mind, the noblest official monument in Petersburg is the quay. On both sides of the river there are about five miles of red granite quays, the parapet consisting of great blocks, which are simply moved out of the way when a barge unloads its cargo. The famous Winter Palace is a plaster building of pronounced Rococo type, architecturally unworthy of its fame. It is painted in two shades of pink and has a certain picturesque richness when seen across the river. The most original building is the Admiralty, which is painted white and yellow, with a green roof and a gold spire, and forms three sides of a quadrangle facing the river. The bottom square has, unfortunately, been built up with residences and palaces, but the two great archways abutting on the river some 400yds. apart form splendid stops to so huge a building. The delicate spire (and spires and towers have always been the strongest line of the Russian architects) is placed at the focal point from which the three great streets of the city radiate, and gleams from miles away.

---

Notes on Competitions

A Competition Memory.

The publication of Mr. Pinkerton's concluding article on "Some Dublin Buildings" in *The Architectural Review* for September draws attention to a competition of a century and a quarter ago, in connection with which it would seem the services of a Competition Reform Society might have been useful. It appears that the Royal Exchange building (now the City Hall) was the outcome of a competition held in 1769. The winning design was by Thomas Cooley, an Englishman, the design placed second being that of James Gandon, the architect subsequently of the Dublin Custom House. Competitors brought to bear all the influence they could command to control the decision in this competition for the Royal Exchange building. Gandon had the powerful backing of the Beresford family, and used it; on the other hand his design was badly slated by an anonymous pamphleteer. In the end, however, the Dublin merchants remained unmoved, and the work was given to Cooley, which was satisfactory from the standpoint of competition ethics. Cooley was also the architect of the Dublin Courts of Law—the Four Courts—but only a commencement with this building had been made at the time of his death; the work was completed by Gandon, who is usually credited with being the sole architect. Gandon, it may be mentioned, won the first prize in the competition for Bethlehem Hospital, London, though the carrying out of the work was given to another architect; thereupon Gandon made use of his powerful friends, and one of them, Lord Carlow, invited him to make plans for a new custom house, docks, &c., in Dublin. The scheme was kept as quiet as possible owing to strong opposition from the City authorities and the people of Dublin to the Government's acquisition of the site. When everything was supposed to have been arranged, Gandon went over to Ireland to start the work, but found that for some time he had to remain practically in hiding, and not go near the site for fear his presence in Dublin should be known. When at length a start was made, the site enclosed, and excavation began, the Corporation made a demonstration, and pulled down some walling. The mob also broke loose, and Gandon, who feared his trenches, was relieved to find the mob amusing itself by swimming in them! After this he was left in peace.

Once, and Once Only.

In the issue of the "American Architect" for August 18th, which has just reached us, we notice a paragraph about a little competition for public drinking-fountains to be erected in New York City, by the American Society for the Prevention of Cruelty to Animals, which is of interest. The Society has been given £100 by a friend of animals, and offers £80 of it as a prize for the best design, intending to pay the remaining £20 for the full-size drawings and for supervision. Notice is given, however, that on making such payment the Society "shall have the right to procure and set up as many replicas or reproductions of the design as they may at any or all times desire, without further compensation to the said winner." Here is clear and honourable notice given of an intended duplication of product after a single design, and opportunity is given anyone to abstain from competing on the ground that, while £80 might satisfactorily enough pay for one fountain, it did not as satisfactorily pay for 5,000. But of even more value is the significant implication that it would be dishonourable to duplicate a product from an architect's design without the designer being notified originally that such was the promoter's intention.

East Wemyss School.

In the competition for alterations and additions to the school at East Wemyss, for the School Board, the design of Mr. George C. Campbell, of the Estate Office, Wemyss, has been selected and adopted.

List of Competitions Open.

DATE OF DELIVERY	COMPETITION.
Aug. 31	HIGH SCHOOL FOR GIRLS AT BARNSLEY. Applications by this date to W. P. Donald, clerk to the Governors, Education Office, Barnsley. Premiums of £100, £50 and £20.
Sept. 3	NEW SECONDARY SCHOOL AT MEXBOROUGH, ROTHERHAM. Limited to architects practising within 35 miles of Mexborough. Particulars from J. W. Hattersley, Secretary to Governors of School, Mexborough.
Sept. 6	LABOURER'S COTTAGE AT GALWAY to cost £80. Premium £5. Particulars from J. Redington, secretary, Urban District Council, Galway. (See advt. on p. xxiii. of this issue.)
Sept. 11	COTTAGE HOMES AT CLEADON and receiving house at workhouse, for Guardians of South Shields Union. Particulars from J. W. Coulson, Union Offices, South Shields.
Sept. 20	SCHOOL AT SUNDERLAND. Limited to local architects. Premiums of £50, £20 and £10. Particulars from John W. Moncur, Borough Engineer, Town Hall, Sunderland.
Sept. 21	CONVALESCENT & NURSES' HOME AT GLOSSOP. Premiums of £20 & £10. Particulars from Mr. T. W. Ellison, Town Clerk, Norfolk Chambers, Glossop.
Sept. 28	SEWAGE DISPOSAL SCHEME FOR ELLESMERE. Premium of £20. Particulars from R. E. Lloyd, clerk to Urban District Council, Ellesmere.
Sept. 29	REBUILDING OF HENSHAW'S BLIND ASYLUM AT MANCHESTER. Limited to Manchester architects. Premiums £100, £50 and £25. Assessor, Mr. John Holden, F.R.I.B.A.
Oct. 1	ALPHABET COMPETITION. Prizes of £20, £10 and £5. For particulars see "Architectural Review."
Oct. 31	BOURSE AT CAIRO.—Premiums of £E250 and £E100. International competition. Designs to be submitted to the "Corporation des Agents de Change," Cairo, Egypt.
Dec. 14	FOUNDLING HOSPITAL, MONTEVIDEO.—Four selected designs in preliminary competition to be awarded £212 each; first premium of £742 in final competition. • Particulars from Consulate-General for Uruguay, 5 & 6, Clement's Inn, London, W.C.

AMERICAN SPECIFICATIONS FOR STONE.

The changes that have been brought about in the writing of specifications in the United States by the development of building methods can scarcely be realised except by an architect or building contractor of very long experience, says Mr. Francis W. Hoyt, in the "American Architect."

One branch of specification writing, however, has shown little improvement, namely, that which relates to stonework and the choice of stone.

During the past quarter of a century decided progress has been made in the study of economic geology. When the science was first taken up as a proper subject for Governmental and State investigation, the geologists devoted all of their time to paleontology, and the establishment of the co-relation of the different geological horizons. These abstruse branches still claim most of their attention, but a few have given extended investigation to economical features. The first real work in this line was done, not in America, but in England. The Royal Commission appointed, about the middle of the last century, to make a choice of a suitable stone for the new Houses of Parliament, went to work most carefully, but in a crude way. Unhappily their selection of the Yorkshire magnesian limestone has disappointed all expectations, for the stone has disintegrated sadly and has proved nothing like as durable as the famous Portland oölite. The work of the commission, however, no matter what its outcome, was a move in the right direction.

British architects, Mr. Hoyt observes, are usually much more precise than their American brethren in stone specifications. "Most stones vary more or less in the different strata or beds, and in England each bed is named. For particular work the English architect specifies, not only the variety, but also the exact bed from which the stone he desires must be drawn. We have not yet reached this degree of particularity, but it would add to the uniformity and durability of our stonework if architects would make a greater effort to familiarise themselves with what has already been accomplished in economic geology. The trouble is that the subject is nowhere taught, and that the literature is widely scattered in dry State and Governmental reports. The one popular work on the subject is *Stones for Building and Decoration*, by Prof. George P. Merrill, of the National Museum."

The points which it is important to consider, if one would write stone specifications that will leave no loopholes for dishonesty or slackness, are the mineral and chemical composition of a stone, strength and durability, effect of weathering, porosity, texture and crystallisation, mode of occurrence (whether massive or stratified), freedom from impurities, and method of quarrying. There have been so many serious delays in the furnishing of stone for important buildings that it is getting to be the custom for architects and building-committees to inspect competing quarries before large contracts are given out. The man who writes the specifications should also have the benefit of extensive quarry observations, if he is to do his best. A study of the weathering of stone can be made with far better effect as it lies in its natural bed than after it has been placed in a building.

In the Tenth Census is given the following table of the "life" of the various kinds of American building stones, by the term "life" being understood the number of years that the stones have been found to last without discoloration or disintegration to the extent of necessitating repairs:

	Life in Years.
Coarse Brownstone … … … … … …	5 to 15
Fine laminated Brownstone … … … …	20 to 50
Compact Brownstone … … … … … …	100 to 200
Coarse fossiliferous Limestone … … …	20 to 40
Fine oölitic (French) Limestone … … …	30 to 40
Marble, coarse, Dolomitic … … … … …	40
Marble, fine, Dolomitic … … … … …	60 to 80
Marble, fine … … … … … … … …	50 to 100
Granite … … … … … … … … …	75 to 200
Gneiss, fifty years to many centuries … …	——

The above table is only a rough help to the specification-writer. Each stone must be studied by itself without regard to its class. There are granites that have begun the process of disintegration before ever they are quarried, and their term of life is short. There are also compact brownstones in which the cementing material has lost its cohesive qualities, so that the grains of silica and quartz crumble apart like loaf sugar. There are, on the contrary, coarse brownstones, like Runcorn, that absorb water like a sponge, and yet have excellent durability.

Continuing, Mr. Hoyt says:—"A great deal of stress is laid on the strength of stone. When crushing tests show a high result, the producer of the stone makes a leading argument of the fact in favour of his material. For ordinary building purposes it makes no practical difference whether a stone can withstand a crushing test of 3 to 4 thousand, or 30 to 40 thousand, lbs. per sq. in. A variation of thousands of pounds in crushing strength can be shown by stones from the same quarry, merely by the skill with which the cubes are prepared for testing."

Special care should be observed, of course, in the preparation of specifications for additions to existing buildings unless contrast is sought. It is not enough to call for stone of the same general class and appearance. Chemical analysis, texture and strength must all be taken into account. An instance showing the danger of using two different stones in the same building is furnished by the State Capitol of Washington. Use was made of two sandstones from different localities, that appeared almost identical at first, but under the influence of weathering they grew very dissimilar. An effort was made to bring the inferior stone back to its original appearance by the use of acid washes, but it was an unfortunate expedient, for the treatment only made the defects worse.

As another example illustrating the necessity for taking the greatest care in specifying stone, we may turn to one of the most conspicuous and important public edifices in New York built of the most coarsely crystalline of the carbonate of lime marbles. Some years after it was erected it was desired to build an addition. The choice fell on a very fine-grained dolomite. The former stone is noted for its non-absorbent qualities. A drop of red ink can be allowed to stand on its surface for hours, and when washed off leaves scarcely a trace. The dolomite absorbs the ink as a lump of sugar takes up coffee from a saucer. It needs no scientist to predict what a lack of harmony there will be between the original building and the addition in a few years' time. If the specifications had been carefully drawn so as to require an accord between the stones of the two parts, the choice of this particular dolomite would have been impossible.

Complete List of Contracts Open.

WITH a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

August 30. Cookstown, Co. Tyrone.—*Erection and completion of a new Catholic Church at Lissan, Cookstown*, Co. Tyrone, for the Very Rev. B. O'Connor, P.P., according to the plans and specification, prepared by Ashlin & Coleman, architects, 7 Dawson Street, Dublin. Bills of quantities have been prepared by D. W. Morris, surveyor, 68, Harcourt Street, Dublin, and can be obtained from him on payment of £1 1s. The plans and specification can be inspected at the Architect's offices, and at the Presbytery, Lissan. Sealed tenders, addressed to the architects, to be delivered at the architects' offices not later than 12 o'clock noon on August 30.

Sept. 1. Penzance.—*Construction of a new warehouse floor* 18ft. by 36ft. Plan and specification can be seen at the office of the Clerk of Works, Trengwainton, Hea-Moor, Penzance. Tenders to be returned not later than Sept. 1, to W. W. Webber, clerk of works.

Sept. 1. Rhosneigr, Anglesey.—*Construction and completion of house, shop and bakehouse* at Rhosneigr. Plans and specifications may be seen of Evans & Co., Chester House, London Road, Holyhead, where the contractor must take his own quantities. Tenders to be in by Sept. 1,

Sept. 1. Dartmouth.—*Erection and completion of new shipping offices* on the South Embankment, Dartmouth, for Renwick, Wilton & Co. Drawings conditions, and specifications may be seen, and forms of tender, together with copies of bills of quantities, obtained, on application, at the offices of P. M. Luke, civil engineer, 15 Princess Square, Plymouth, and upon payment of a deposit of £2 2s. Sealed tenders, accompanied by fully-priced quantities, and endorsed "Tender for Shipping Offices," must reach Mr. Luke on or before Sept. 1.

Sept. 3. Canterbury.—*Alteration at the Municipal Offices in Guildhall Street.* Particulars of the work may be obtained at the offices of A. C. Turley, Assoc.M.Inst.C.E., city surveyor, City Surveyor's Office, Canterbury. Sealed tenders for the work must be forwarded to the Town Clerk, Burgate Street, by 5 p.m. on Sept. 3.

Sept. 3. Fife. — *Erection of joint infectious diseases hospital* near St. Michael's, Leuchars, Fife. Applications for schedules must be lodged with W. Carruthers Laidlaw, architect, 4, York Buildings, Edinburgh, from whom schedules can be obtained on payment of a deposit of £1. All tenders must be lodged with the architect not later than Sept. 3.

Sept. 3. Dartmouth.—*Demolition and rebuilding of the Globe Inn*, Smith Street, Dartmouth, for J. Bartlett & Co. Persons desirous of submitting an estimate are requested to send their names to R. M. Luke, civil engineer, 15, Princess Square, Plymouth, where drawings, conditions, and specifications may be seen, and further information obtained. Sealed tenders, endorsed "Tender for Globe Inn," must be delivered to him not later than Sept. 3.

Sept 3. Stourton.—*Providing and erecting a wood and iron fencing* round the new sewage disposal works at Stourton, for the Rothwell Urban District Council. Plans and specfication can be seen and particulars obtained at theoffices of E. J. Silcock, M.I.C.E., engineer, 10 Park Row, Leeds. Sealed tenders, endorsed "Stourton Fencing" must be delivered to W. Dodgson, clerk to the Council, Council Offices, Rothwell, near Leeds, not later than noon Sept 3.

Sept. 3. Tettenhall.—*Pulling down and re-erection of a brick wall* (about 50 square yards), situate at the Barnhurst Sewage Farm, Tettenhall, near Wolverhampton. Plans may be seen, and specification and form of tender obtained, on application at the Office of G. Green, borough engineer, Town Hall. Wolverhampton. Tenders addressed to the Chairman of the Sewerage Committee, to be delivered at the Town Clerk's Office by 10 a.m. on Sept. 3. Fair wages clause.

Sept. 3. Castleblayney.—*Erection of a goods store (90ft.×25ft.) and office (20ft.×14ft.)* of timber, with galvanised corrugated iron roof, &c., at their Castleblaney Station, for the Directors of the Great Northern Ry. Co. (Ireland). Parties wishing to tender may see the drawing and specification at the office of W. H. Mills, Engineer-in-Chief, Amiens Street Terminus, Dublin, or copies of them at the office of the District Engineer, Belfast, and forms of tender can be obtained at either of the said offices on payment of 1s. each. Tenders made out on the forms supplied by the Company, and endorsed "Tender for Goods Store," should be delivered to T. Morrison (Secretary), Secretary's Office, Amiens Street Terminus, Dublin, not later than 10 a.m. on Sept. 3.

Beaumont & Son, 10, St. James's Square, Manchester. Tenders must be delivered before 12 o'clock noon on Sept. 11, sealed and endorsed, to W. F. Knott. Parish Offices, Ashton-under-Lyne.

Sept. 11. Audenshaw. — *Erection of a new public elementary school* at Audenshaw. The plans may be seen and bills of quantities obtained at the office of Henry Littler, county architect, 16, Ribblesdale Place, Preston, by payment of a deposit of £2. Tenders must be delivered before 12 o'clock noon on September 11, sealed and endorsed, to W. F. Knott, Parish Offices, Ashton-under-Lyne.

Sept. 12. Merthyr Tydfil.—*Additions and improvements* to Bethesda Congregational Chapel, Merthyr Tydfil. The plans and specifications can be seen with Mr. Rees Jones, grocer, Bethesda Street. The tenders to be sent, sealed and endorsed, to J. Thomas, 90, Brecon Road, Merthyr Tydfil, not later than Sept. 12.

Sept. 13. Chartham Hatch.—*Alteration and enlargement, to accommodate 40 additional children of the Council School at Chartham Hatch*, near Canterbury, Kent. Drawings and specifications may be inspected at the office of W. J. Jennings, architect, 4, St. Margaret's Street, Canterbury. Any person desiring to tender and to receive copy of bills of quantities must send his name to the architect, together with a deposit of £1, not later than noon on September 4. Tenders on the form supplied to be delivered to F. S. Cloke, Sandwich, Kent, not later than noon on September 13.

Sept. 14. Harthill-with-Woodall, West Riding.—*Erection of a new cloakroom at Harthill-with-Woodall* Provided School for the West Riding County Council. Plans may be seen and quantities obtained on application to J. Vickers Edwards, county architect, County Hall, Wakefield. A deposit of £1 is required, which will be returned on receipt of a *bona fide* tender. Cheques to be sent to the West Riding Treasurer, County Hall, Wakefield. Sealed tenders, properly endorsed, to be sent to the County Architect, not later than 10.30 on the morning of Sept. 14.

Sept. 14. Wakefield, West Riding.—*Different works in connection with the following schools:*—Thornton-in-Craven new School, Elslack new School, Cudworth new School, Kirkhamgate new School, Bolton-on-Dearne (Goldthorpe, Infants), Provided School (enlargement), Mytholmroyd (Scout Road Provided School, sanitary alterations), Mytholmroyd (Burnley Road Provided School, sanitary alterations), Mytholmroyd (Cragg Vale Provided School, sanitary alterations—builder and plumber), Harthill-with-Woodhall Provided School (alterations and new cloakroom—builder, &c.), Adwick-on-Dearne Provided School (alterations and repairs—builder and asphalter), for the West Riding C.C. Education Committee. Plans may be seen and quantities obtained on application to J. Vickers Edwards, county architect, County Hall, Wakefield. A deposit of £1 is required for each of the above schools. Cheques to be sent to the West Riding Treasurer, County Hall, Wakefield. Sealed tenders, properly endorsed, to be sent to the County Architect not later than 10.30 on the morning of Sept. 14.

Sept. 15. Hounslow.—*Erection of a new infants school at Spring Grove*, to accommodate 350 children, for the Heston and Isleworth U.D Education Committee. The plans may be inspected at the office of A. Lang, architect, Council House, Hounslow, where also bills of quantities may be obtained, together with specification and form of tender, on payment of a deposit of £2 2s. Tenders on the forms supplied, to be delivered to H. J. Baker, clerk to the committee, Council House, Hounslow, not later than 12 noon on September 15, endorsed "Tender for Spring Grove Infants School."

Sept. 17. Gainsborough.—*Pulling down and rebuilding premises in Bridge Street*, Gainsborough, belonging to the Gainsborough Industrial Co-operative Society, Ltd. Bills of quantities and form of tender may be had on application to Scorn and Gamble, architects, Bank Street Chambers, Lincoln, on or before September 5 and on payment of £2 2s. The drawings and conditions of contract may be inspected at the offices of the architects. Tenders must be delivered to the manager at the office of the Society, 11, Bridge Street, Gainsborough, and in the envelope provided for the purpose, before 10 a.m. on September 17.

Sept. 18. London, S.E.—*Erecting a public convenience and bath houses* at Bell Green, Lower Sydenham. Drawings, specification, and form of contract can be seen, and a copy of the drawings, specification, and form of tender may be obtained at the Town Hall, Catford (Surveyor's Department), on payment of a deposit of £5. The tenders must be on forms issued by the Council, enclosed in an envelope, sealed and endorsed "Tender for Convenience and Bath Houses," and must be delivered by 4 o'clock on Sept. 18 at the Town Hall, and placed in the box there provided for the purpose. The work must be proceeded with immediately on obtaining the Borough Surveyor's order to commence the work, and the contractor must employ local labour as far as practicable in carrying out the work. Fair wages clause.

Sept. 27. London, E. — *Additions and alterations in the building at the Electricity Works*, Osborn Street, Whitechapel, E. Persons tendering must submit the names and addresses of two substantial persons willing to be jointly and severally bound for the due and proper performance of the contract. Fair wages clause. The drawings may be seen and copies of the stipulations, specification, schedule, and form of tender may be obtained by applying to M. W Jameson, A.M.Inst.C.E., borough engineer, 15, Great Alie Street, Whitechapel, E., between the hours of 10 a.m. and 12 noon, upon paying £5. Tenders, endorsed "Tenders for Additions to Electricity Buildings," should be sent to G. W. Clarke, town clerk, 15, Great Alie Street, Whitechapel. E., in the envelopes supplied, so as arrive at this office on before 12 o'clock noon on Sept. 27.

No date. Pannal.—*Erection and completion of a new house*, Hill Foot, Pannal, for A. Rushworth, Esq. Contractors are requested to send in their names to R. Crosland, architect, 10, James Street, Harrogate, and quantities will be forwarded when ready.

No date. Bristol.—*New warehouses upon the Bath Road*, Bristol. Quantities can be obtained and plans and specifications inspected upon application to J. Harding & Son, architects and surveyors, Salisbury.

No date. Swadlincote. — *Erection of a free library at Swadlincote* for the U.D.C. Plans and specifications may be seen, and quantities and particulars obtained, at the office of A. Macpherson, Esq., architect, 16 Tennant Street, Derby, on payment of deposit of £2 2s.

No date. Chesterfield.—*Erection and completion of four new cottages and two shops*, Durrant Road, Chesterfield. Contractors can see plans, and obtain bills of quantities and all further information at the offices of W. C. Jackson, M.S.A., architect and surveyor, 29, Knifesmith Gate, Chesterfield.

ENGINEERING.

August 31. Margam.—*Construction of an iron girder bridge with stone abutments and approaches*, for the U.D. of Margam. Plans and specification may be seen by appointment with J. Cox, surveyor to the Council, Port Talbot, on payment of a deposit of £1 1s. Tenders to be delivered to D. E. Jones, solicitor, clerk to the Council, Port Talbot, not later than August 31, sealed and endorsed, "Tender for Hoel-y-Glo Bridges."

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, *Great New Street, Fetter Lane, E.C.*

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Buntingford (Herts).—Accepted for the construction of new waterworks for the Buntingford R.D.C. :—

Grounds and Newton, Page Green, South Tottenham	£3,164 6 2

Charfield (Glos.).—For the erection of a pair of labourers' cottages at Starveall Farm, for the Governors of Katharine Lady Berkeley's Grammar School. Messrs. Thomas Scammell, Son & Perkins, architects and surveyors, Bristol and Wotton-under-Edge, Glos. :—

E. Clarke, Fishponds	£500
S. J. Simmonds, Rangeworthy	496
W. Blaken, North Nibly	4-3
W. Pitcher, Thornbury	450
A. Jotcham, Wotton-under-Edge	439
J. Brown. Bristol	430
*J. Hawkins & Sons, Ridgeway	395

* Accepted.

Wotton-under-Edge (Glos.).—For repairs and alterations to Dr. Boyce's house, "The Chipping," for the Governors of Katharine Lady Berkeley's Grammar School. Messrs. Thomas Scammell, Son and Perkins, architects and surveyors, Bristol and Wotton-under-Edge, Glos. :—

A. Jotcham	£127 0 0
R. Cook	110 15 0
R. Keynton	109 10 0
J. Jotcham...	102 10 0
J. Hawkins,* Ridgeway	98 10 0

L. H. & R. Roberts	3,499	1.988
Cubitt & Co....	2,930	1,600

Plumstead.—For the construction of stables, &c., at 31, Plumstead Common Road, Mr. Fredk J. Gurney, architect and surveyor, 72, Cantwell Road, Shooter's Hill, S.E. :—

J. H. Sutch	£635
Thomas & Edge	625
A. J. Ware	579
Joseph Sanford	545
Sanford & Co.*	470

Architect's estimate £570.
* Accepted.

Sherburn (Durham).—For constructing sewage-purification works for the Durham R.D.C. Mr. G. Gregson, surveyor :—

R. Oliver, Durham	£1,497	17	9
J. Arundale's representatives, Bradford and Newcastle... ...	1,347	0	0
J. Carrick,* Durham	1,212	4	8
R. C. Birtley, Stanley	1,120	9	8

Surveyor's estimate, £1,300
* Accepted.

Teignmouth.—For laying and jointing about 17,110 lin. yds. of 9in., about 1,120 lin. yds. of 6in., and about 5,850 lin. yds. of 4in. British Mannesmann steel pipes, including haulage of pipes, erection of a meter-house, &c., for the Teignmouth U.D.C. Mr. Charles F. Gettings, Town Hall, Teignmouth, engineer :—

Uncorrected amounts.

FIRE SUPPLEMENT (MONTHLY).

THE THERMAL CONDUCTIVITY OF CONCRETE & THE EFFECT OF HEAT UPON ITS STRENGTH & ELASTIC PROPERTIES.*

By Prof. Ira H. Woolson, M.E.

This paper is a record of some experiments made in continuation of work described in a previous paper before the American Society for Testing Materials.† That paper recorded a series of tests showing that both the strength and elasticity of concrete were rapidly diminished by the application of comparatively low heat for moderate periods of time. The results appeared quite contradictory to well-established evidence regarding the behaviour of that material in actual fires, and in fire tests of full size floor units. Endeavouring to elucidate this discrepancy, the writer made a single experiment on the conductivity of concrete which apparently explained the whole variation, and pointed to the fact that the virtue of concrete as a fire-resisting material was due to its

high non-conductivity.

The other tests showed that if it were thoroughly heated to 1,500° Fahr. its strength and elasticity were largely dissipated.

In the discussion which followed the reading of the paper it was suggested that further investigation of the conductivity of concrete should be made; also, that additional proof of the other results, using larger specimens and different concrete mixtures, was desirable. At the request of the Joint Committee on Concrete, the writer has continued the experiments, and this paper is a summary of the new data.

The actual work

of preparing and testing the specimens, making the calculations, and plotting the curves was done by students in the Department of Mechanical Engineering, Columbia University, under the writer's direction. This year the investigation was made by Messrs. R. M. Olyphant, junr., George W. Riddle and W. Putnam, students in the senior class, who did the work as a thesis problem. Their hearty co-operation and faithful attention to detail has alone made this paper possible.

The composition

used was the same as last year—namely, a 1-2-4 mixture of Portland cement, sharp sand and ¾-in. clean broken stone, both trap rock and limestone being employed. In addition to these, other specimens were made in the same proportions, using clean ½-in. quartz gravel instead of the broken stone, and, in another set, clean boiler cinders instead of stone. The cement was furnished by the committee and was said to be composed of a mixture of giant, lehigh and vulcanite. It was a slow-setting cement, taking 7hrs. and 40mins. for initial set, and 14hrs. 10mins. for hard set. The average strength neat for 1 day was 246lbs.; 7 days was 710lbs. Mixed with three parts sand, the average for 7 days was 160lbs., and for 28 days, 286lbs. The concrete was mixed moderately wet and well tamped. The specimens were left in the moulds 36hrs., then removed and submerged in water for 7 days, after which they were allowed to stand for 7 weeks in a cellar, being occasionally sprinkled.

Rise of Temperature Similar to Actual Fire Conditions.

It was suggested that instead of raising the temperature of the specimens very slowly, so that three or four hours were consumed in attaining a furnace temperature of 1,500° to 2,000° Fahr., as was done last year, it would be instructive to bring the furnace temperature rapidly up to some fixed point, then holding it there for a definite period, the idea being that duplicate tests would be easier and the conditions approach more nearly those of an actual fire. This was done in all cases in the present series of experiments; 1,500° Fahr. was adopted as a fair average, and the furnace raised to that temperature in 40min. to 60min. and held there for the balance of the test. It was thought unwise to raise the temperature faster than this for fear of producing internal stresses that might rupture the specimens. In one instance the furnace did not work properly, and the necessary heat was not secured in an hour. Three sizes of specimens were made: 4-in. cubes, 5-in. cubes and 6-in. × 6-in. × 14-in. prisms. The latter were used for measuring the elastic properties. The 4-in. cubes were made for comparing the strength of the new concrete with that of last year.

Method of Heating.

The specimens were heated in an oven-type of gas furnace. Those placed entirely inside the furnace were protected from the direct impact of the flames on the sides by shields of fire brick or clay tiles. This was done to ensure as nearly as possible an even distribution of heat throughout the whole specimen.

Three and five hours were chosen for the times of heating the large specimens, and two and three hours for the 4in. cubes. It was estimated that the internal temperature of the small specimens in that time would be about the same as that of the large specimens exposed the longer time. These time periods include that required for the furnace to reach 1,500° Fahr. After heating, the specimens were removed from the furnace and allowed to cool slowly in air.

The temperatures were measured

by a carefully standardised Le Chatelier pyrometer, readings being taken simultaneously every ten minutes upon the thermocouple placed between the specimens, which registered the temperature of the furnace, and upon those embedded in the specimens, which gave the corresponding internal temperatures at the points taken.

The specimens used to measure the conductivity by heating upon one side only were placed in the doorway of the furnace with the exposed face on a line with the furnace wall. These specimens completely filled the doorway with the exception of an inch at the top which was filled with magnesite board. Fig. 1 shows the arrangement of large specimens in the furnace and in doorway.

Specimens designed for strength tests were faced with plaster of Paris.

A few tests were made upon some specimens left over from last year's experiments, and two or three upon some samples of 1-2-3 trap rock mixtures two years old.

Classification of Specimens.

Lot A	1-2-4 mixture, limestone,	age 2 months.
Lot B	1-2-4 mixture, trap rock,	age 2 months
Lot C	1-2-4 mixture, cinder,	age 2 months.
Lot D	1-2-4 mixture gravel,	age 2 months.
Lot E	1-2-4 mixture, limestone,	age 1 year.
Lot F	1-2-4 mixture, trap trap,	age 1 year.
Lot H	1-2-4 mixture, trap rock,	age 1 year.
Lot K	1-2-3 mixture, trap rock,	age 2 years.

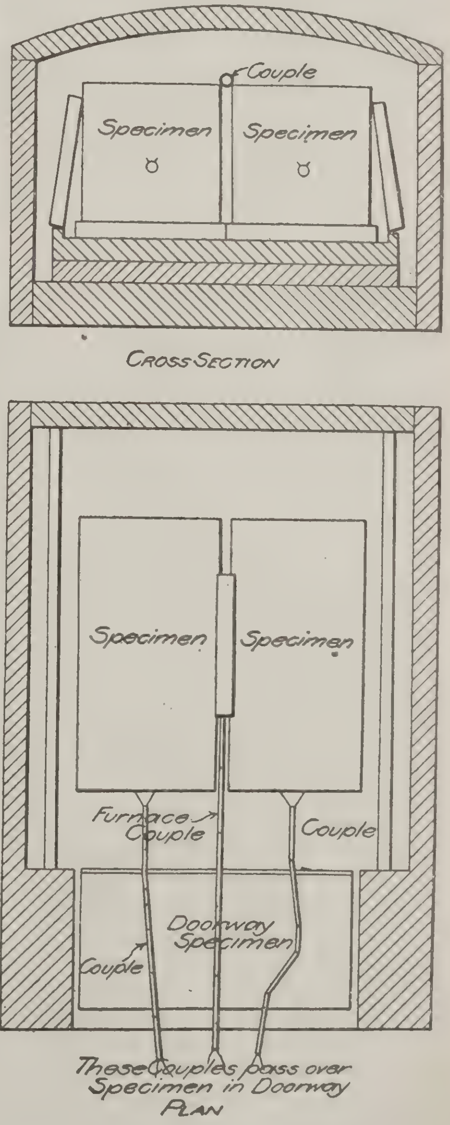

FIG. 1. LARGE SPECIMENS IN FURNACE AND IN DOORWAY.

---

* A paper read before the American Society for Testing Materials.

† "The Effect of Heat upon the Crushing Strength and Elastic Properties of Concrete," published in the "Fire Supplement" to our issue for June 6th last.—Ed. B. J.

Conductivity Tests.

Most of the specimens used in this investigation were 7-in. cubes, this being as large as the furnace would take. A few were 6-in. by 6-in. by 14-in. prisms. When these specimens were made, thermocouples were cast in them at varying distances from the surface, the idea being that when these were tested in the furnace and the temperature readings taken simultaneously upon the furnace atmosphere, and the couples embedded at varying depths in the concrete, the rate of transmission of heat through the concrete would be obtained. The work was carefully done, but results were confusing, and subsequeut breaking of the specimens showed that the couples had been shifted by tamping the concrete when the specimens were made. In some cases they were an inch out of place and this completely nullified the work in regard to obtaining a rate of transmission from these specimens. Figs. 3 to 6 are the curves plotted from these tests for a period of five hours in each instance. One curve gives the temperature of the furnace, which was brought up to 1,500° Fahr. in less than an hour and held there for the balance of the test, and the other curves show the corresponding temperatures on the interior of the specimens. Although the depths given to the couples are not entirely reliable, for reasons already explained, nevertheless the curves are very interesting in showing the general lag in the rise of temperature in the specimen as compared with the furnace temperature.

The gravel specimens
were the only ones which attained an interior temperature equal to the furnace temperature.

It is rather surprising to note that
cinder came next to the gravel
in the amount of interior heat recorded, for cinder concrete is well known to be an effective fire resistant. However, the cinder concrete specimen, tested in the furnace doorway, gave the lowest interior heat. It was found impossible with the small furnace employed to maintain an even distribution of heat, and undoubtedly some of the conflicting testimony of the tests was attributable to this cause.

The curves in Fig. 6 are from tests of specimens one and two years old, and although the furnace worked badly, thus giving a very slow temperature rise, there is no evidence that either specimen possessed heat-resisting qualities superior to those of the new concretes.

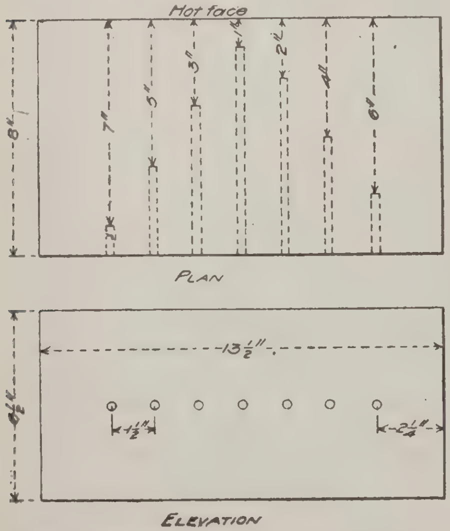

FIG. 7.—ARRANGEMENT OF HOLES FOR THERMO-COUPLES.

Attention is called to one peculiar characteristic in all the curves. This is the flattening out at or a little after 212° Fahr. is past, showing that after steam begins to generate there is little if any rise in temperature until all the water in the concrete has been evaporated. The only curve in which this peculiarity is absent is K1, Fig. 6, and this specimen was two years old; it had been kept in a very dry room for over a year, and probably contained very little moisture. This was the only specimen available at this age, and, unfortunately, it was tested when the furnace worked badly, so the results are not conclusive.

After ascertaining that the locations of the thermocouples in the above-described specimens were not all exact, one special trap rock block was made having seven holes ¼in. in diameter cored in as shown in Fig. 7. The bottoms of the holes were arranged from 1in. to 7ins. from the face to be exposed to heat, and the holes were spaced 1½in. apart. Thermocouples were sealed in these holes and all connected through a switchboard to the same galvanometer. The position of these thermocouples was absolutely assured.

This specimen was placed in the furnace doorway and subjected to 1500° Fahr. on one face for five hours (see Fig. 8). Readings were taken every ten minutes on each thermocouple, and the results are shown in the plotted temperature curves in Fig. 9. These curves are very instructive, although there is some interference. The first salient characteristic of them all is the lag at the 212° point. It will be noted that this is greater with increased thickness of the concrete; also that up to 3-in. thickness the recorded temperature at which it occurs is above 212°, showing that the surface of the concrete heated very rapidly and went above the boiling point of water. It is undoubtedly these conditions which cause steam to generate enough to become explosive and burst off patches of concrete, which is a common occurrence in fire tests.

The curves for the points 1in. and 2ins. from the heated face are nearly the same. The indications are that they would have been run together had the test continued longer. The reason for this is not apparent,

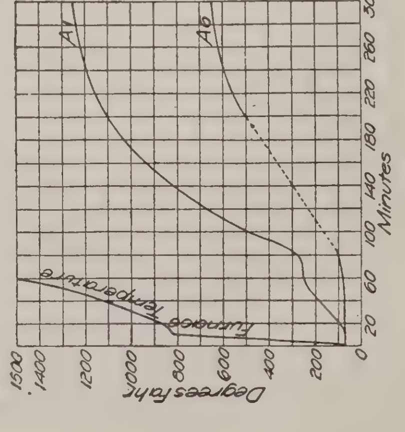

FIG. 2.

Limestone, 2 months old.

TEMPERATURE RISE AT DIFFERENT POINTS IN LIMESTONE, TRAP, CINDER AND GRAVEL CONCRETES, ALL 1 : 2 : 4 MIXTURES.

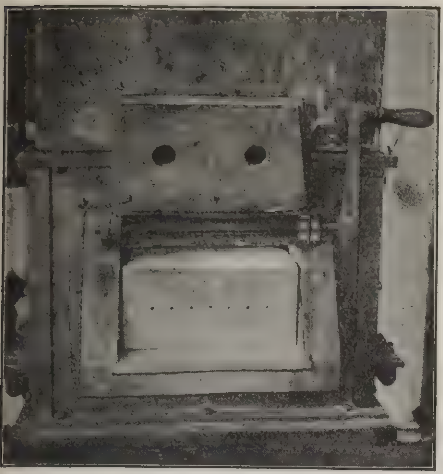

FIG. 8. SPECIMEN IN FURNACE FOR HEATING ON ONE SIDE.

but it may have been due to an accidental arrangement of the stone in the concrete in such a way as to form a comparatively solid stone connection between the thermocouples, which by its better conducting qualities tended to equalise the temperature between the points.

Considering these two curves as one, there is a marked parallelism between it and the curves embedded 3, 4 and 5 ins. in the concrete, and the distance between them is very constant. The curves for 6 and 7-in. points are irregular, although No. 7 is nearly parallel with the others. No. 6 is particularly freakish. The reason for this is plain. Points No. 6 and 7 were 2¼ins. from the end of the block, and as these ends were more or less heated from the furnace walls, the points in question received some heat from this source as well as the face. This threw their temporary curves out of harmony with the central points, which were not so affected.

As a whole, they are regular and indicate that the heat-resisting quality is **not a direct function of the distance** from the heated surface to interior point at which the temperatures were measured. It will be noted that the curves flatten out and that doubling the distance more than doubled the time required to secure the same temperature rise.

These curves as well as those of Figs. 2 to 6 show conclusively that the very low thermal conductivity of concrete indicated by the single test reported in our paper of last year was entirely correct. They prove that two or three inches of concrete properly mixed, tamped and set, will resist a fierce conflagration for hours without permitting a serious temperature rise upon the opposite side.

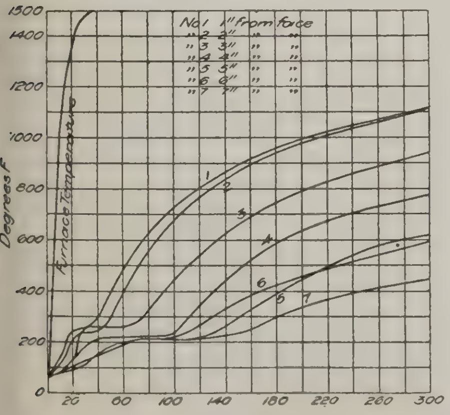

FIG. 9. TEMPERATURE CURVES.

Strength and Elasticity Tests.

Table I. gives the results of tests upon the 4-in. cubes. In the one-year-old specimens (E and F) comparison is given with tests of duplicates made when they were one month old. The increase in strength is not large. Both the limestone and trap specimens made this year are much stronger than those made a year ago. The probable explanation is that the specimens were soaked in water this year for one week on removal from the moulds, and last year were only sprinkled. It is doubtful if they then received sufficient water to produce a perfect set of the cement.

It will be noted that specimens A and B, when heated three hours at 1,500° Fahr., were stronger than those heated two hours. This is contrary to all our previous experience and must be attributed to one of two causes: either the specimens heated two hours happened to be weak structurally, or the three-hour specimens were protected in some way in the furnace and did not get the heat credited to them. In any event the results are anomalous and should be rejected.

TABLE I.

CRUSHING STRENGTH OF CONCRETE BEFORE AND AFTER HEATING.

Lot	Material.	Not Heated.	Same lot in 1905 when 1 mo. old.	After heating 2 hrs. at 1,500° F.	After heating 3 hrs. at 1,500° F.	After heating 5 hrs. at 1,500° F.
		Breaking Loads, Lb. Per Sq. In.				
		4 × 4 × 4-in. specimens.				
A	Limestone ...	3,030	—	980	1,445

		2,165	1,843	1,110	906	
			1,640	1,200		
				1,290		
F	Trap Rock, 1 year old ...	2,230	1,903	1,525	665	
		2,800	1,913	—	695	
		2,240	1,982	—	—	4 hrs,
K	6-in. cube limestone 2 yrs. old	2,290	—	—	—	2,005
		6 × 6 × 14-in. specimens.				
A	... ...	2,740	—	—	1,345	870
B	... ...	3,140	—	—	1,400	997
C	... ...	1,400	—	—	547	504
D	... ...	2,780				

NOTE.—Where more than one breaking load is given it indicates that several specimens were tested.

No strength tests were made upon heated gravel specimens because they all either fell in pieces upon removal from the furnace or were so badly cracked as to prohibit testing them.

Table II. gives the modulus of elasticity (E) calculated on increasing loads for specimens that had been heated for different times. Usually the moduli of unheated specimens decrease with increase of load, but it is not infrequent that they reverse the rule: the exception is in evidence in this series.

The moduli of the heated specimens are very low in value, but in all cases the value increases with increase of load. This peculiarity was referred to last year. The reason is not clear, but perhaps it is because the specimen expanded on heating, and, when cooling, the outside contracts more rapidly, thus developing many fine cracks which do not entirely close when normal temperature is reached. The first loads applied to the specimen serve merely to close these cracks, and the compression observed is not, therefore, the true deformation of the concrete for these pressures. The value of the moduli decreases very rapidly with increase of heat treatment. This fact was also brought out last year; the present figures are merely confirmatory.

The limestone lost about 50 per cent. of its strength when heated 2 hours, and the trap about 55 per cent. The difference was undoubtedly accidental, for we well know that trap is superior to limestone in resisting heat. They both lost 68 per cent. of their strength in 5 hours, when heated on all sides with no radiation permissible.

Effect of Heating on One Face.

The strength of the 6-in. by 6-in. by 14-in. specimens heated on one face (see Table III.) is in marked contrast to those heated on all sides, and shows that under that condition the concrete retains a large part of its strength even after five hours of exposure to a temperature of 1,500° Fahr. As a matter of fact the specimens tested in this manner really received considerable heat upon four other faces, for it was impossible to protect them from the radiant heat from the furnace walls, so they were probably heated more thoroughly than they would have been had they formed a part of a concrete wall facing the fire.

The great feature of the elastic curves obtained from the 6-in. by 6-in. by 14-in.

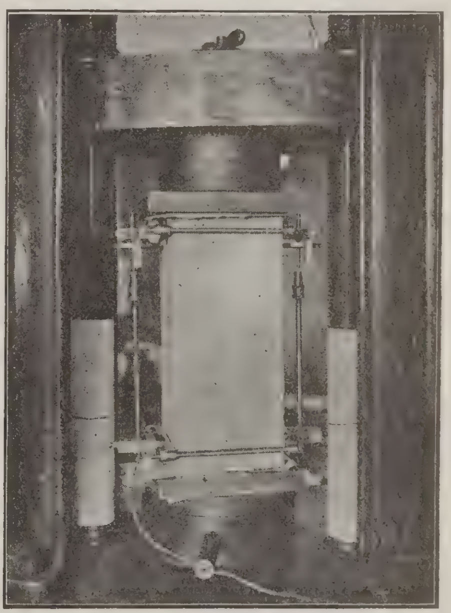

FIG. 10. SPECIMEN READY FOR ELASTIC TEST

A	Limestone	293,400	521,700	730,700	1,840
B	Trap Rock	200,000	268,000	379,000	1,705

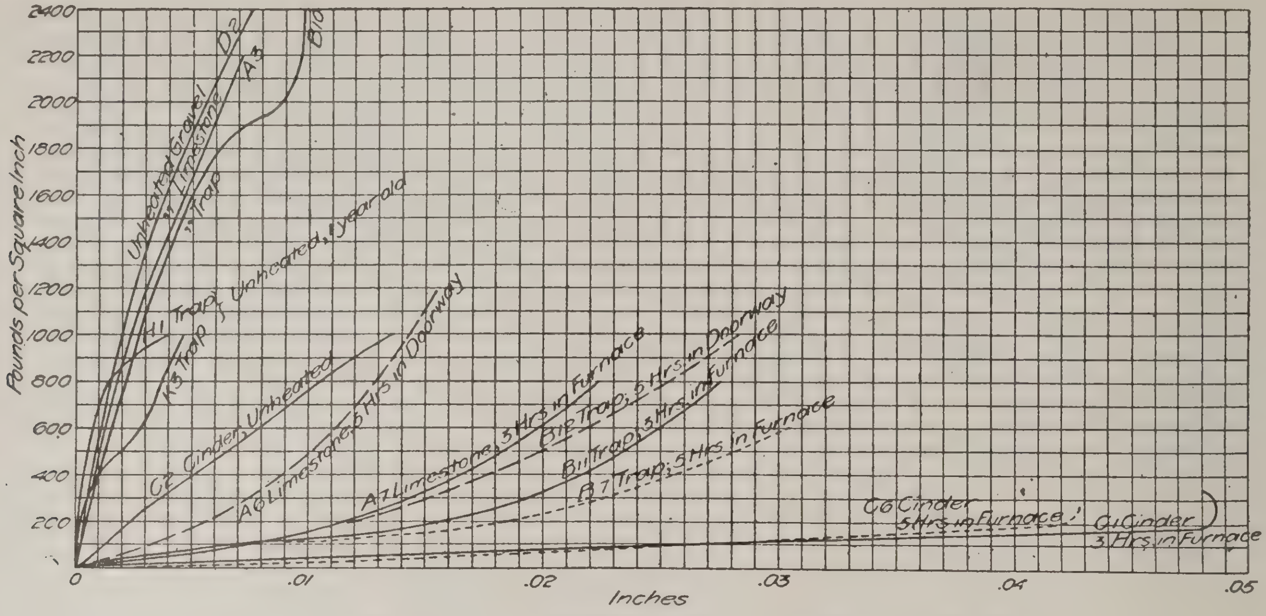

FIG. 11. CURVES OF ELASTIC COMPRESSION GROUPED ACCORDING TO TREATMENT.

specimens both before and after heat treatment is the great increase in deformation with loss of strength due to heat treatment. Fig. 10 shows the method of measuring the deformations. The elastic curves of the specimens, which were one and two years old respectively, do not, apparently, show any material increase in their fire-resisting qualities, although these specimens were heated only 4 hours. Fig. 11 gives the true elastic curves, grouped according to treatment, without regard to the total deflections from which they were derived.

Fire Resistance Affected by Treatment During Period of Getting.

The marked difference in the strength of the specimens made last year and this year, in which the same stone was used, and presumably an equal quality of cement, show that the treatment during the period of setting has much to do with the quality of the concrete. It would be interesting to ascertain if the fire-resisting properties are influenced by the amount of moisture absorbed by the concrete while setting is taking place.

It is fully recognised that definite conclusions cannot be drawn from tests so incomplete as these; but they serve to point the way, and it is hoped that more elaborate experiments may be made which will furnish the additional evidence necessary.

The London County Council and its District Surveyors.—The London County Council is taking legal opinion on the question whether it is liable to pay fees to the district surveyors under the London Building Act, 1894, for surveying buildings owned by the Council. The Government auditor, Mr. Barclay Cockerton, expresses the belief that all such buildings are exempt.

Messrs. Stidder & Co., consulting sanitary and general engineers, of 16, Percy Street, Tottenham Court Road, W., have been appointed sole agents for London and district for the following firms:—Messrs. Joseph King & Co., Terra Cotta Brick and Tile Works, Stourbridge; Messrs. King Brothers, Stourbridge British Fireclay and Brick Works; The Art Tile Co., Stourbridge; The British Sanitary Co. (earth-closets); The Bonnybridge Silica and Fireclay Co., Ltd.; The Dewsbury Electric Manufacturing Co., Ltd. (motors, cranes, etc.).

THE LONDON COUNTY COUNCIL'S FIRE REQUIREMENTS.

With some Notes on Fire-resisting Construction.*

By Percival M. Fraser.

Materials with regard to their Fire-resisting Qualities.

Well-burnt clay bricks are the most reliable building material. Lime mortar is to be preferred to cement. Fireclay is, of course, best, but is not so strong.

Terra-cotta in its porous form is highly satisfactory. There are several other descriptions of terra-cotta which are all more or less useless as a fire-resisting material.

Plaster made with plaster of Paris is a tolerable heat resistant, as it stands drenching at a white heat; it is improved by the addition of asbestos or pumice stone.

Concrete in slabs, of which the aggregate is pumice stone, is classed with the "full resistance" materials.

Reinforced concrete is an excellent fire resistant, provided the reinforcement is 2ins. from the surface.

The following compositions of concrete are given as being highly serviceable. The effects of severe tests with fire and water are also briefly given. The following proportions are mixed with one part of ferro-concrete cement, the sand being sharp pit sand:—

1. Slag 3, sand 2.—Slight cracks and deflection.
2. Broken granite 3, sand 2.— Ditto.
3. Broken granite 3, sand 2.— Ditto and washed off slightly.
4. Burnt ballast 5.—Washed off badly.
5. Coke-breeze 5.—Washed of slightly
6. Furnace clinkers 3, sand 2.—Slight cracks and deflection.
7. River ballast 3, sand 2.—This is wholly bad.

Sandstones are better than limestones and granites, but all are unreliable.

Iron and steel unprotected are unfit for use for constructional purposes. Iron expands about 1½ins. in 10ft. under prolonged heat.

Silicate cotton, slag wool or asbestos are useful materials, as they are quite incombustible, and may be procured in slabs and sheets, or in the form of cloth.

Timber in baulk is perhaps as good a fire resister as can be obtained, as after it is once charred it burns very slowly, and retains its strength when suddenly drenched. Its life is greatly increased by being coated with plaster or tin. The so-called fire-proof paints are of very little practical value.

The possibility of ingition of timber may be decreased by the use of tungstate of soda, silicate of soda and limewash, and asbestos paint. These, however, merely resist ignition, and cannot be considered to resist fire. Treated woods become hydroscopic and brittle, they also discolour and are hard to work.

Floors are of many descriptions.

Arched floors are strong, but heavy and expensive.

Various forms of hollow tubes and slabs of terra-cotta and asbestos, &c. These are all cheap, light and serviceable.

Concrete reinforced with steel rods makes an excellent floor.

Pavings may be of cement, asphalt, metallic paving, wood blocks and wood boards laid directly on to the concrete; these should be tarred on the underside.

Cork carpet on concrete makes a very good floor.

A tongued wood floor of ordinary construction with plastered ceiling will stand an ordinary conflagration for about an hour.

Flats are constructed similarly to floors, but are lighter and are best asphalted; Vulcanite and wood cement are largely used.

Partitions.

Ordinary lath and plaster partitions, when the intervening spaces are filled in with slag wool, are rendered fire-resisting and sound proof.

Other light partitions are formed in concrete, brick on edge, terra-cotta, asbestos, and other slabs, Uralite, expanded metal and plaster, or fine coke-breeze concrete, all of which may be fixed on a steel or wood framework.

An air space in the thickness of a partition is a great advantage.

Continuous sheets of metal when used for reinforcement are bad, as they tend to buckle under heat.

Staircases.

Baulk timber is the best material for steps. Other steps are constructed of reinforced or ordinary concrete, stone and built-up hardwood.

---

* A paper read at the meeting of the Institute of Sanitary Engineers held at Manchester on July 6.

Doors.

Iron doors, as stated before, are required by the Council, but unless secured all round the edges are practically useless. Sliding doors are best, as they can be held on at least three sides.

Armoured sliding doors are perhaps the best for use in party walls between large buildings. These are made up with wood and Uralite, or sheet tin, and can be arranged by means of inclined runners so that when a certain temperature is reached the door fastenings give way and the door is allowed to close automatically by gravitation. I have always used this description of door as made by Messrs. Mather & Platt and always find them to be serviceable for general use.

Glazing.

This has already been described under Factory Buildings. Opinions differ as to whether roof glazing over staircases, well holes, &c., should be fire resisting, or whether it should be constructed so as to break in case of fire and carry away smoke and flames. I think this is a bad principle, as every time a staircase door is opened huge volumes of smoke are drawn in and thus render the staircase impassable. The use of shutters is not advisable.

Miscellaneous.

Simple precautions against the spread of fire should be employed in every class of building, such as floor pugging and treating woodwork with solutions and the use of steel roofs and concrete stairs with wood casing.

Automatic sprinklers which act at a temperature of 150 to 200 degrees are useful for checking a fire in its infancy, but are open to objection.

Automatic fire alarms are useful, but require constant attention.

GLASS AND FIRE.

A good deal of attention has been paid to the fire resistance of floors, walls and roofs, but insufficient attention has been given to the protection of vertical openings. In order to stop the spread of fire there is something more necessary than heavy brick walls, for walls are almost never unbroken. They are cut up by windows, by light wells and areas of various widths, and it is through these openings that fires spread. Not only does this happen in the case of light wells, light courts and areas, but even across wide streets, as, for instance, in the Barbican fire, the Baltimore fire, and the San Francisco fire. A good many tests have been carried out to determine the resistance of special forms of glazing under fire, but it is interesting to observe the results in actual fires. We publish herewith three views showing examples of Luxfer electro-glazing that have successfully passed through actual fires. The view of the McClurg Book Store in Chicago is a striking one. It will be seen that electro-glazed Luxfer prisms still remain in position. The hanging icicles that have resulted from the playing-on of the water in severely frosty weather give a weird effect. The Luxfer plate in the Barbican fire in April, 1902, and the electro-glazed plate from a fire at 58, Coleman Street, London, show that the glass, though cracked, still remained in position.

FLAME-PROOF WOOD.*

The Views of Professor Vivian B. Lewes.

Although timber, like all organic substances, is combustible and will undergo destructive distillation when exposed to a high temperature, yet it can be treated in such a way as to render it flame-proof, so that the action of intense heat upon it is merely to char it, but not to set it on fire in such a way that it can spread the combustion.

First attempts.

It is now more than three centuries ago since attempts were first made to render timber used for ship-building fire-proof, and from the early years of the 17th century down to the present time countless attempts have been made to protect wood in such a way as to prevent its being combustible. Hardly any of these attempts passed the experimental stage, and chiefly consisted of applying paints made with mineral matter, like silicates, for coating the surface of the wood, and also many strange solutions for soaking it in before use, but all these attempts, as far as fire-proofing is concerned, ended in failure. It became evident that unless the protecting ingredient could be got into the structure of the wood so as to permeate it to the core, and so make it part of the wood itself, a successful and satisfactory result was not possible of attainment.

Sir Humphrey Davy and Faraday.

In the last century Sir Humphrey Davy and Faraday both attempted to solve the problem, and since then many scientific men have devoted considerable time and attention to it, but although it was easy enough as a laboratory experiment to render a splint of wood non-flammable, directly it was attempted on a commercially practical scale, abject failure was the only result.

The cause of these failures is not far to seek. Impregnation of a most thorough character is an absolute necessity, but every kind of wood has to be treated in a different way in order to meet the requirements of the varying densities, and as this depends not only upon the kind of wood, but also on the age of the timber and the character of the soil on which it grew, not only did the process have to be varied with different specimens of timber, but also for different samples of the same timber when grown under different conditions, these being points which only now have been recognised.

Substances used for Fire-proofing.

A wide variety of substances has been suggested for fire-proofing, and the salts employed are now generally spoken of as "anti-pyrenes," but many of these have now been found to be absolutely unsuitable, owing either to their action upon the wood itself or upon the materials which had to be used with it. One of the most popular substances in the early experiments was common salt, but it was soon found that timber impregnated with it could not be commercially used because of its hygroscopic properties. Other substances then employed to effect the fire-proofing were found to rot the wood, whilst some very rapidly corroded the nails and screws used with the impregnated timber. Other chemicals again, although they might do the required work for a short space of time, volatilised and left the timber as inflammable as it was before.

Compounds in use.

Practical experience has narrowed the list of efficacious compounds to—

Ammonium chloride.
,, phosphate.
,, sulphate.
Calcium chloride.
Magnesium chloride.
Zinc chloride.

Zinc sulphate.
Stannous chloride.
Alum.
Borax.
Boracic acid.
Aluminium hydrate.

How the Timber is Treated.

In making the non-flammable wood the timber is run on small trolleys into large cylinders, in which, by means of a vacuum, all air and moisture are extracted from the cells of the wood, and the solution of the chemicals is then run in. The contents of the cylinder are placed under hydraulic pressure, carefully regulated according to the character of the wood, a pressure which is needed by one kind of wood crushing and destroying the cells of another. Indeed, the success of the whole process depends upon minutiæ of this kind, and the placing on the market of improperly treated wood has created a prejudice against such processes that has done much to retard its introduction.

After Impregnation.

After impregnating, the completion of which is indicated by the gauge glass on the cylinder showing that the right proportion of the liquid has been absorbed, the wood is removed, drained, and dried at a carefully regulated temperature, this again having a great influence on the quality of the finished wood, temperatures above 85° F. tending to render many kinds of wood brittle, whilst when dried at the right temperature the wood not only retains all the qualities of the original wood, with the exception of inflammability, but is thoroughly seasoned and ready for the joiners' shop.

Made in this way non-flammable wood is a perfect building material, has no effect upon the workmen's tools, as was the case when the earlier antipyrenes were used, and will take paint, stains, varnish, or other decorative treatment as well as it did before fire-proofing, but now combines the dual advantages of excessively low conductivity with a great power of resisting fire, and entire freedom from spreading fire.

The Cellulose.

As before pointed out, the cellulose of the wood is still there, and whilst a fierce flame is playing upon it this compound is carbonised, inflammable gases being generated and burning with small jets of flame, but the moment the heating flame is removed the charred mass blackens, and no spreading of the fire takes place.

This effect is caused by the chemicals used, consisting chiefly of ammonium phosphate and boracic acid, which during treatment crystallise in the cells of the wood, and can therefore never be removed. Under the influence of heat the ammonium phosphate decomposes to ammonia gas and phosphoric acid, the former driving all air out of the cells and replacing it by a non-flammable gas, whilst the phosphoric and boracic acids exude and coat the cell walls with a glaze, which, while allowing the gases from the decomposing cellulose to escape, prevents the access of oxygen from the air to carry on further combustion.

Where its use should be enforced.

Even should the apathy of the public, and the greed of the speculative builder combine to prevent wood so prepared having the universal adoption it deserves, its use should be enforced in all new hotels, public buildings and places of entertainment, where it would afford more protection in case of fire than the multiplication of exits can ever do.

It is far easier, moreover, to treat fabrics than wood, as the cotton, consisting of minute tubes, will easily suck in and absorb a solution of the antipyrenes, when merely soaked in it, without the paraphernalia of vacuum cylinder and hydraulic pressure pump, and when properly prepared will take the colours as well as the original canvas. With scenery so prepared and fire-proof battens and slate, no fire to cause danger could take place.

Decay and Rot Prevented.

The salts present in the wood prevent decay and dry rot, whilst the important advantage in its use is that its presence prevents the formation of pyrophoric char on wood exposed for long periods to the action of hot water pipes, flues, &c.

The coming of the motor car and the motor boat, and the rapid spread of electric traction has created a new class of fire risk, unfortunately more dangerous to life than to property.

The current necessary to drive an electric train is amply powerful to work an electric furnace, and when owing to a faulty splice in the connecting wires on the cars, or other fault, a short circuit is produced, any inflammable substance exposed to the enormous temperature of the arc is at once set in a blaze, and the iron tube enclosing the wires is no more protection than a cardboard one would be, as the metal is melted away at once.

For the Protection of Trains.

Now, a train on fire at any time is unpleasant, but when the fire takes place in an underground tunnel, where if you escape the flames you are suffocated by fumes and smoke, it is too awful to contemplate. The dreadful disasters which have taken place in Paris and Liverpool, and which have only been narrowly avoided in London on more than one occasion, should make the public for their own safety insist on a guarantee that the cars have been built of non-flammable wood, before using the line. The District Railway has taken the precaution to do this, but how many non-flammable trains are running on other lines I am not in a position to say.

In the petrol motor-omnibus also the ignition of the petrol might lead to most disastrous results where the car was built of inflammable material, and nothing but non-flammable wood should be used for this purpose, whilst for motor-boats, in the Navy, and for the woodwork of passenger and cargo steamers it would be of the greatest value.

Cost.

In all cases, however, it is the question of cost which militates against the introduction of improvements of the most valuable kind, and with non-flammable wood the matter at first sight seems very serious. To properly impregnate the wood something like 4lbs. of expensive chemicals have to be used per cubic foot, this, however, not increasing the weight of the finished wood, as it is more than made up for by the moisture withdrawn, and the result is that with cheap timber, such as the deals used for ordinary building purposes, the protection may cost as much as the wood, and if you are going to look upon it as doubling the cost of the material I admit the chance of getting builders to adopt it is small. I venture to submit, however, that this would be an entirely erroneous method of considering the question, and that the true way is to take the extra cost on the finished building or structure.

---

* Part of a paper read by Prof. Lewes, of the Royal Naval College, Greenwich, before the Society of Arts.

An Insurance.

In any house, carriage or car the amount of wood present is sufficient to ensure the total loss of the whole structure should the wood burn away. Now, if you are building a car which will cost £1,000 if built with inflammable, and £1,100 if built with non-flammable wood, I think there are few persons who would not prefer to spend the additional 10 per cent. for the certainty that it would save them the cost of the car if the petrol caught fire.

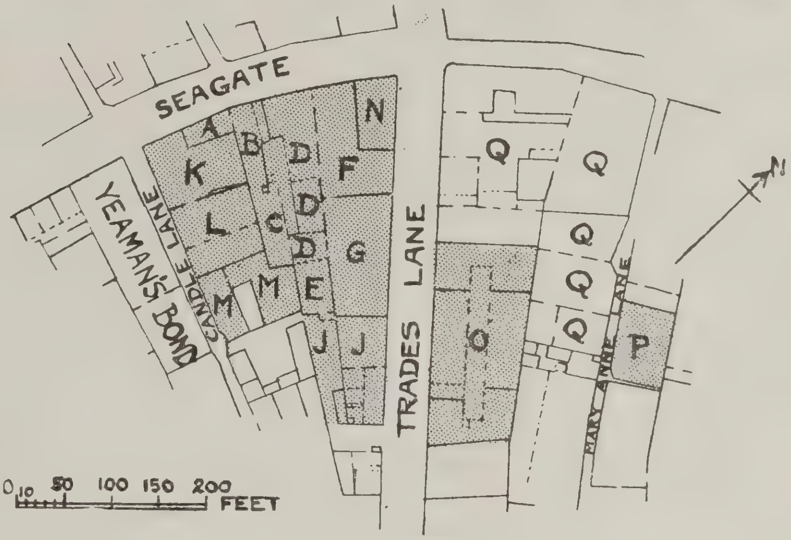
Looked at from this point of view I think it will be admitted that in all large buildings the increase on the gross cost would be so small as to make it almost a duty to adopt a measure that is not only for one's own safety but for the good of the community at large.

A DUNDEE FIRE.

The big fire at Dundee on July 19th had several interesting features constructionally. The area of the fire is shown on the plan reproduced. The fire originated in the roof or in the top floor of the bonded warehouse marked **F** on the plan, belonging to Messrs. James Watson & Co., Ltd., whisky merchants and distillers. The bonds contained what is known as the liquor which had not come under the purview of His Majesty's officers for the payment of duty. From cellar to roof it is calculated that in all between 40,000 and 50,000 casks were stored—equal to about a million gallons of spirit. The burning spirit spread in all directions, and not only freely passed the double iron doors which shut the openings between the various parts of the premises lettered **C, D, D.D, F & G** on our plan, but also found its way through the solid walls between Messrs. Watson's premises and those of Messrs. John Robertson & Son, Ltd., whose bonds were also well stocked.

Ultimately both Watson's and Robertson's premises were reduced to ruins, together with the buildings in the immediate area involved occupied by the Scottish

VIEW OF THE DUNDEE FIRE FROM CORNER OF TRADES LANE AND SEAGATE.



PLAN OF THE DUNDEE FIRE.

James Watson & Co., Ltd.—**A.** Offices and Caretaker's Dwelling, 4 floors; **B.** Offices and Wine Stores 3 and 4 floors and basement; **C.** Wine Cellars and Warehouse, 4 floors and basement; **D.D.D.** Warehouses, 4 floors and basement; **E.** Cask Store and Cooperage, 1 floor and basement; **F.** Warehouse, 6 floors and basement; **G.** Warehouse, 6 floors and basement; **J.J.** Cooperage, 1 storey.
John Robertson & Son, Ltd.—**K.** Bonded Warehouse. 4 and 5 floors; **L.** Bonded Warehouse, 3, 4, and 5 floors and basement.
Stewart Robertson.—**M.M.** Sanitary Engineer's Store, 1 and 2 floors.
Scottish Co-operative Wholesale Society, Ltd.—**N.** Grocery Stores, 2 floors, attic and basement.
T. S. Ross & Co.—**O.** Jute Warehouse, 2 floors.
John Henderson & Co.—**P.** Jute Warehouse, 1 storey.
Trades Lane Calendering Co., Ltd.—**Q.Q.Q.Q.Q.** Warehouses, 1, 2, and 3 floors and attics.

THE DUNDEE FIRE: VIEW OF ROBERTSON'S BOND.

Co-operative Wholesale Society, Ltd., as a provision warehouse, and Mr. Stewart Robertson, as a store for fire-clay goods, &c. Messrs. T. S. Ross & Co.'s jute warewarehouses on the east side of Trades Lane were gutted, the roofs having been ignited independently of each other by falling embers. Yeaman's Bond No. 2 on the west, and Trades Lane Calendering Co. on the east, were only saved by the heroic exertions of the brigades and of the Calendar employees, but they were seriously damaged by fire and water. Later, Messrs. John Henderson & Co.'s jute warehouse in Mary Anne Lane was similarly gutted. Fortunately the wind held from the north-west, which aided the brigades in saving the buildings fronting the north side of Seagate, and they escaped with comparatively little damage.

On Friday the walls of the jute warehouses in Trades Lane developed an outward bulge, which hour by hour perceptibly increased. The massive stonework, however, resisted the pressure of the sodden and expanding jute, and by Sunday, such was the strain on the foundations, that the pavement was torn up, the heavy slab being contorted into all sorts of fantastic shapes. It was not till 12.15 on Tuesday morning that the masonry gave way, the débris blocking the street and penetrating the wall of the cooperage opposite. During the forenoon the workmen successfully demolished the north gable, with the collapse of which the arch also yielded. The total loss to the fire offices is estimated at £463,000, divided between 26 companies, the nett losses running from £2,500 to £15,000.

This is the third great whisky fire in Scotland within three years. In June, 1903, the Ardgowan Distillery, Greenock, was entirely destroyed, making a loss of about £60,000; and in October, 1904, the North of Scotland Distillery, Aberdeen, was burnt out, the loss being £90,000.

When Messrs. Watson's building was put up efforts were made to construct it with a view of being fire resisting. The date of its erection was 1895, and the building embodies the ideas of that period —*i.e.*, of 10 years ago; in fact, embodies ideas somewhat in advance of that date.

The two lower floors—which were the important floors—were constructed of concrete, supported by iron joists and columns, both joists and columns being well encased with concrete. The upper floors were, however, of poorer design with wide joists.

The nett result of the fire was that the lower floors stood up to the very fierce fire, but the whole of the upper part of the building was gutted.

Perhaps we should add that the floors which have stood up against the fire were constructed by Mr. Boyd Wilson, of Messrs. Watson Bros., Glasgow, under the supervision of Mr. Alexander Johnstone, architect. of Dundee.

For the two illustrations on this page we are indebted to *Engineering.*

FIRE-RESISTING VILLA RESIDENCES.

Partly with a view to testing the practicability of fire-resisting construction in small houses, and also with a view to solid construction, following the injunctions of John Ruskin in his "Seven Lamps," "I would have, then, our ordinary dwelling-houses built to last," Messrs. S. & A. K. Salisbury, M.M.S.A., have recently completed two fire-resisting residences at Harpenden, Herts, at a cost of just over £1,000 each. The floors in the first are Messrs. Archibald D. Dawnay & Sons' solid tile and concrete, and in the second house Messrs. Hodkin & Jones's corrugated-bar system. In both houses the internal walls are 4½-in. brickwork, and, where partitions are necessary, Hemel Hempstead partition blocks are used, and the stairs are "granolithic" stone. A third house is now being erected with the Kleine patent fire-resisting flooring. It is claimed that the substantial construction, the entire absence of timber built into walls, the freedom from cracked ceilings and springing floors, the consequent longer probable life of the building, affording greater security as an investment, together with the protection from fire, will fully justify the small additional cost involved.

Under Euston Station it is proposed to construct another station for the suggested electric line between the terminus and Watford.

Demolition of Wembley Tower.—The demolition of Sir Edward Watkin's ill-fated copy of the Eiffel Tower at Wembley Park, London, N., has been commenced by a firm of Manchester contractors. The design was chosen from among 50 sent in. It was to excel the Eiffel Tower in height and splendour. As a matter of fact, however, it never attained more than 150ft. out of 1,200ft. The five "footings" are set in 20ft. of concrete, and measure 60ft. by 60ft. each.

Changes in the Modern House. THE many changes which have been made in our houses within the last quarter of a century must be regarded with very great satisfaction. The chief alterations have been in the interior, but attention has also been given to the exterior. In the suburbs the pseudo-Gothic, while still revered by speculative builders and incompetent persons calling themselves architects, is no longer the offence which it used to be. Even some of the older and most atrocious examples have been made less formidable, or even unobtrusive, by the mellowing influence of time and a generous growth of creeper, while the newer houses are, many of them, quite admirable in design and clearly the work of architects better trained than the average practitioners of the last century. We make a dead set against the Gothic house building referred to above, not because we have any particular antipathy to Gothic *per se*, but because it is a style demanding a very keen sense of proportion, however much the construction side may be urged. For that reason we have always supported the movement in favour of English Renaissance and Georgian house architecture. We repeat that, although on account of the comparative simplicity of the elevation, the work we now term "Georgian" may not, in some cases, call for a very high standard of ability, nevertheless it has its subtle features, more especially those of proportion, which can only be applied successfully after careful study, while to the accomplished architect it offers innumerable opportunities for quiet treatment and effective design. In reviewing the architectural exhibits at the Academy in recent years we have had again and again to point out the increasing number of houses of this class. Let anybody look at one of Mr. Ernest Newton's houses, and then compare it with some of the Gothic productions to be found enshrubbed round about our towns. Matters architectural have improved since the days when those houses were built. It is true that we still have with us the builder who delights in trefoils and quatrefoils carved at so much a dozen on suburban villas, in company with unwieldy-looking leaves and birds on either side of the doorway, or on keystones over the windows, but even he is fast losing his hold; and although the architect has still to face the many and fearful desires of the client whose knowledge of architecture is probably limited to a cursory reading of "The Stones of Venice," borrowed from the local library, and whose wife (the architect always has to count with her) gauges the merit of a design in proportion to the size of its windows and the projection of its eaves, still, changes are going on in the right direction, and the result is that the houses which we see about us are better in design than the products of a former generation. The interior, too, has been improved, not only in convenience of planning, but also in regard to decoration and furniture. There is no need now to point out what excellent wallpapers can be obtained at reasonable prices, or that the stock-in-trade of a Victorian era is being rapidly cleared out of the modern furniture shop, its place being taken by reproductions of the work of Chippendale, Sheraton, and other masters. Zealous modernists may deplore such harking back, and make a paramount claim for the furniture of to-day being essentially our own. We cannot, however, go with them to such length, for we would rather see our houses filled with reproductions of an earlier English period when taste was inherently good than have rooms made ugly with chairs and tables in all kinds of grotesque shapes, with uncomfortable knobs and corners and sharp angles in the most unsuspected places, as in "L'Art Nouveau"; or the spidery and curly stuff of some French designers, elegant to look upon, but too fragile for everyday use; or, finally, those products worthy of the primitive herdsman which some cranks would foist on us as part of the return to "the simple life."

A Warning. Within the last year or so we have several times noticed heavy girders being taken through London streets on ordinary lorries drawn by two horses. We would draw attention to the danger thus incurred. The carts in question have been built for ordinary merchandise—sacks, boxes, &c.—set down on the body of the vehicle and held in by the sides. Yet enormous girders are put on them, projecting beyond the tail of the cart to within a foot or so of the roadway, and held in place by chains, while the other end stretches over the horses and rests on the front of the cart. One day an accident will happen, the horses will be terribly mutilated and killed, and then there will be an outcry about the criminal negligence of allowing such things to be. They ought not to be allowed, of course. One or two steelwork firms, we observe, have specially constructed wagons for taking these heavy girders through the streets, and the front of these wagons is not of the ordinary wooden construction, but of iron, well-stayed. It would be well if others responsible followed the example.

The Silly Season. AT a time when there is a dearth of matter, when the societies are dozing, and the Law is on its lengthy vacation, it seems rather hard that the technical journalist should be debarred the joys of his confrères of the daily press. Alas, the technical journal has no "silly season." Not in its pages are to be found the engrossing letters from fervent readers which fill so amply the newspaper columns: not for it the discussion of domestic felicities or national foibles. It has, one would think, to be always "au grand sérieux," and the reader is too holiday-demoralised to study the matter before him. Yet, what a world of possibilities lies untouched. Why, indeed, should the technical journal not have its silly season? Are there no momentous questions to discuss? Forsooth, a thousand. "Do bricklayers swear?" "Is the architectural assistant a snob?" "Should we crib?" "Are illicit commissions a failure?" "Do we believe the trade traveller?" "Do clients pay?" What an untouched field, and what a harvest for the technical journalist! The reader would devour this, would wade through columns of debate on the veracity of the trade traveller or the piquant emphasis of the average bricklayer. It might leave him none the wiser, but he would be prepared to read a lot more of it. As it is, much good work goes unread, while the immaculate assistant gives himself over to captious criticism. How are the mighty fallen!

R.I.B.A. EXAMINATIONS.

Model Answers by A. G. Bond, B.A., A.R.I.B.A.

The Final Examination.

Subject I.—DESIGN.

[*Time of examination, eleven hours and a half. Maximum number of marks*, 350.]

1.—*Subject: A farmhouse for a tenant farmer on an open site sloping gently towards the south-west. Requirements.—Ground floor: parlour, front kitchen (or living room), back kitchen (or scullery), larder, dairy, washhouse, fuel-shed, tool-shed, two e.c.'s—one accessible from the back yard, the other from the garden. First floor: four or five bedrooms. Attic: bedroom and a box-room. Basement: cellar optional. (Note.—The possibility of the parlour and a bedroom being let as lodgings during summer-time may be taken into account.) Drawings required:—Three plans (with roof lines dotted on attic plan), two elevations, section—all to be drawn to* $\frac{1}{8}$*th scale: a portion of the front from ground to ridge to be drawn to* ¼*in. scale: perspective sketch.*

NOTE—Probably the majority of the candidates were relieved when they found what subject had been set for design, and it seems certainly less likely to have caused anxiety than some of the subjects set at previous examinations, amongst which may be mentioned the block of flats in 1901 and the district council offices in 1905; though it is true an opportunity to study some of the technicalities is always given beforehand, candidates being advised of the subject a few days before the actual examination. In the present instance there was certainly a freedom from the usual restrictions both as to by-laws and site, but, in designing, this is not always a thing to be wished for. In such a case, therefore, one would be wise to make the most of the three following salient conditions—namely, the aspect and slope of the site, the provision of a dairy, and the possibility of letting-off two of the rooms. In regard to the first of these, it affords an opportunity to make the front rooms loftier than the back portion of the ground floor; the living-room should undoubtedly have a south-east window, and the parlour might well be at the west corner of the building, leaving a north-west external wall which would tend to keep it cool in the summer, when it would evidently be most in requisition. In regard to the second point, the dairy must of course be arranged with a north light, and the other walls might with advantage be built hollow; it must also be kept well away from the e.c's., washhouse and kitchen. As to the third condition mentioned, perhaps the best provisions to make for this separation are (1) a back staircase (one opening direct from the living-room would do), and (2) the arrangement of the "letting" bedroom in such a way that it should be the one most accessible from the main staircase, and should have an aspect with a certain amount of east in it. Other points to be aimed at are a quiet and suitable elevation, a roof of simple construction, the grouping together of the flues, and the avoidance of waste of space in landings and passages. It may be added that it is a good plan to map out one's time beforehand in a subject of this sort, devoting, say, Friday to the $\frac{1}{8}$th scale drawings, Saturday morning to the ½-in. details, and Saturday afternoon to the perspective sketch.

Subject II.—THE PRINCIPAL STYLES OF ARCHITECTURE: THEIR FEATURES, MOULDINGS, AND ORNAMENTS.

[*Time of examination, three hours and a half. Maximum number of marks*, 125. *The candidate to work in the style selected by him.*]

A.—Classic and Renaissance.

1. *Explain fully, with sketches, the following terms:—Baldachino, Campanile, Abacus, Guilloche, Telamones.*

BALDACHINO: A canopy supported by columns or suspended from the roof and placed over an altar in a place of worship. Examples are still in use in many continental cities. Fig. 1 is from the church of St. George at Rome.

CAMPANILE: A tower for the reception of bells, separate from the church. The term is generally applied to the Italian examples, such as that at Verona (Fig. 2).

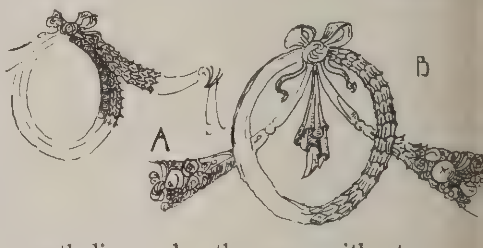
ABACUS: See definition and illustration given in Intermediate paper, subject 1, question 4, in THE BUILDERS' JOURNAL for July 11th last.

GUILLOCHE: A banded and intertwining running ornament, generally applied to a torus moulding (see Fig. 3, an example of the triple guilloche).

TELAMONES: (Greek, τλαω = I support) Figures of men used as supports, architecturally synonymous with "Atlantes," a term which is derived from the same Greek word. See Fig. 4.

2. *Sketch in detail a wreath of oval outline, the wreath to be in conjunction with festoons, one on either side. The festoons and oval wreath to be suspended from the same point by ribbon attachment. Particularly show how the festoons and wreath would meet together without confusion.*

This question tests the candidate's powers of applying historic forms to a particular problem. There are several possible solutions, two of which are here illustrated by rough sketches such as would be all that would be possible in the actual examination. In the case of *a* the foliated wreath lies under the swag without confusion, while in *b* the oval wreath is employed and the swag is kept thin until it has passed beneath it. In *a*, of course, the enclosed oval could not be used as a window or medallion frame, and the space is finished with a drop of drapery or fruit.



3. *Give a detail sketch of any portion of the Banqueting House, Whitehall, or St. Paul's Cathedral, or Somerset House, or Greenwich Hospital, with which you are acquainted.*

See illustrations.

NOTE.—A detail sketch from one only of the four examples named was asked for, but two are here given—namely, from St. Paul's and from Somerset House, which indicate the sort of sketch the examiners would expect. Similarly a portion from either the Banqueting Hall, Whitehall, or from Greenwich Hospital could be selected by the candidate if preferred. The candidate will find full measured details of the north porch of St. Paul's in THE BUILDERS' JOURNAL for February 8th, 1899.

4. *Give front and side elevation, to a scale of 4ft. to 1in., of an external enriched doorway, not less than 5ft. wide, in the manner of Michael Angelo, Galeazzo Allessi, Inigo Jones, or Christopher Wren.*

See illustrations.

NOTE.—As with question 3, two out of the four have been selected to give the candidate an idea of the sort of work required in answer to such a question. The doorway by Michael Angelo has been selected as typical, although it is less than 5ft. wide; for the purposes of the examination it would have to be adapted. (Good measured drawings of this sacristy appear in THE BUILDERS' JOURNAL for March 27th, 1901.) The doorway from Raynham Hall, Norfolk, illustrates Jones's manner, but, of

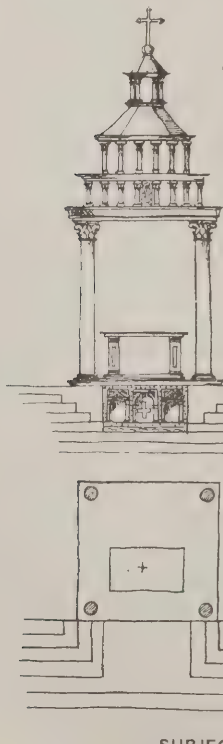


FIG 1

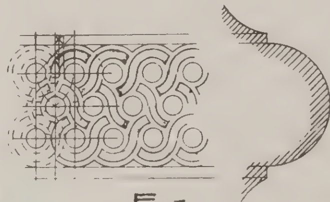

FIG. 3.

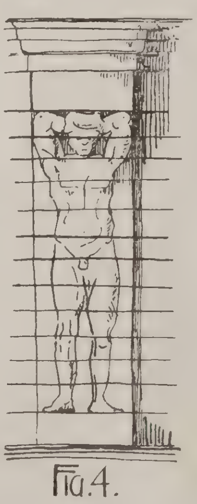

FIG. 4.

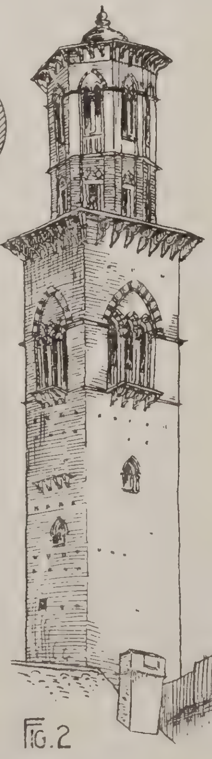

FIG. 2

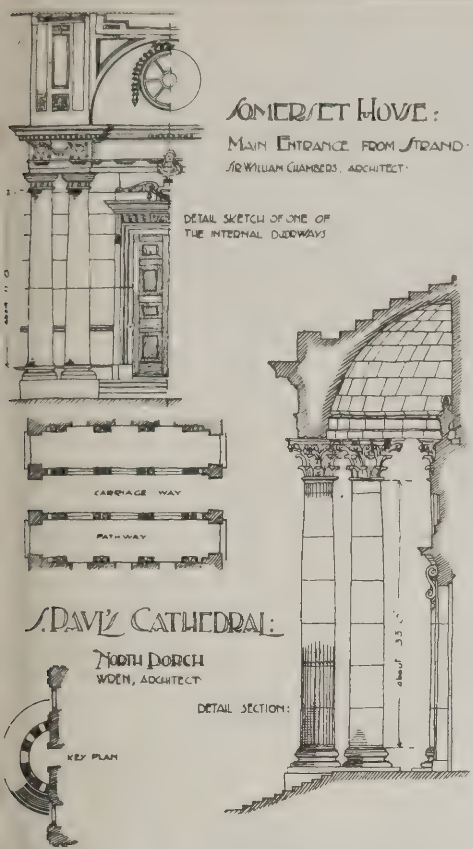
SUBJECT II, PART A; ANSWERS TO QUESTION I.



SUBJECT II, PART A; ANSWER TO QUESTION 3.

course, the candidate was at liberty to choose a doorway of Allessi or Wren in place of either of those given.

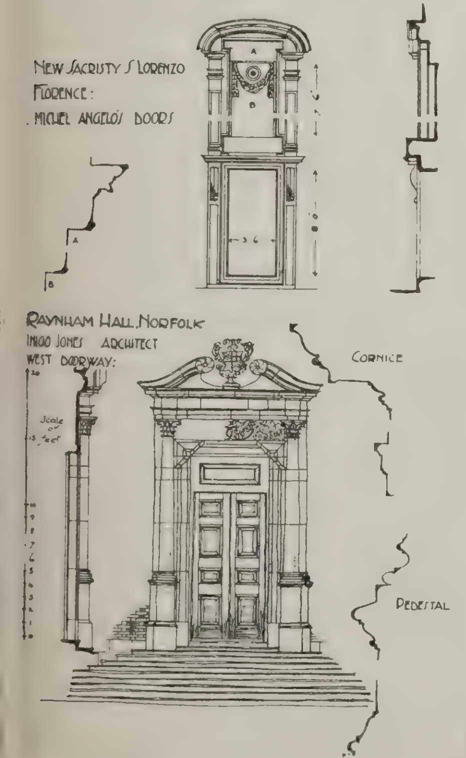
B.—*Medieval.*

5. *Describe and sketch the following:—Brattishing, Chantry, Lectern, Oriel, Squinch.*

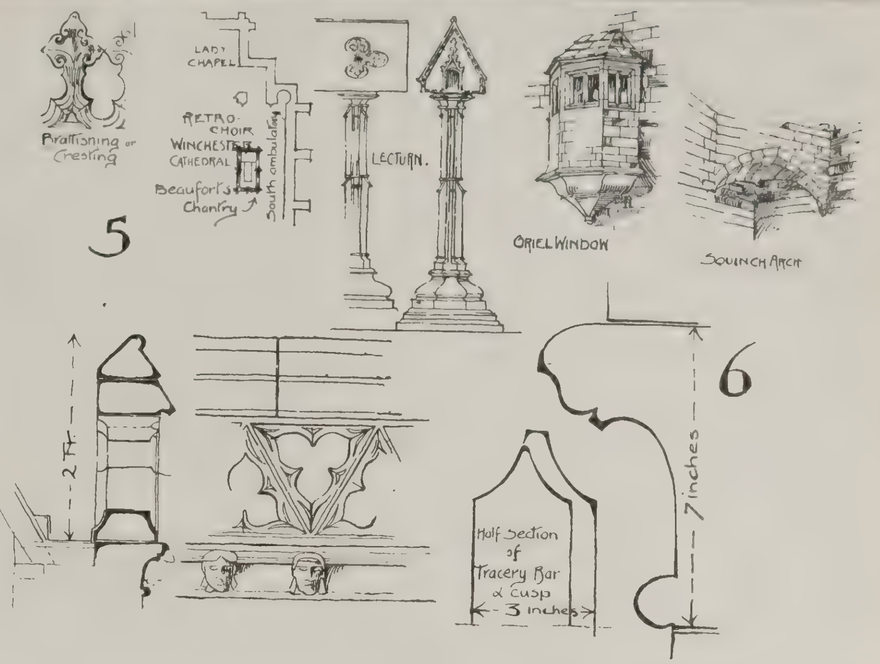
See illustrations.

BRATTISHING.—A word which occurs in many forms, signifying a cresting, or perhaps, more strictly speaking, a battlement.

CHANTRY.—Literally an endowment for the chanting of masses, but now generally applied to the chantry-chapel in which the testator desired the masses to be sung.



SUBJECT II, PART A; ANSWER TO QUESTION 4.



SUBJECT II, PART B; ANSWERS TO QUESTIONS 5 AND 6.

LECTERN.—A reading desk for the larger books—generally in England for the Bible—usually of wood or brass. Many good medieval examples still exist.

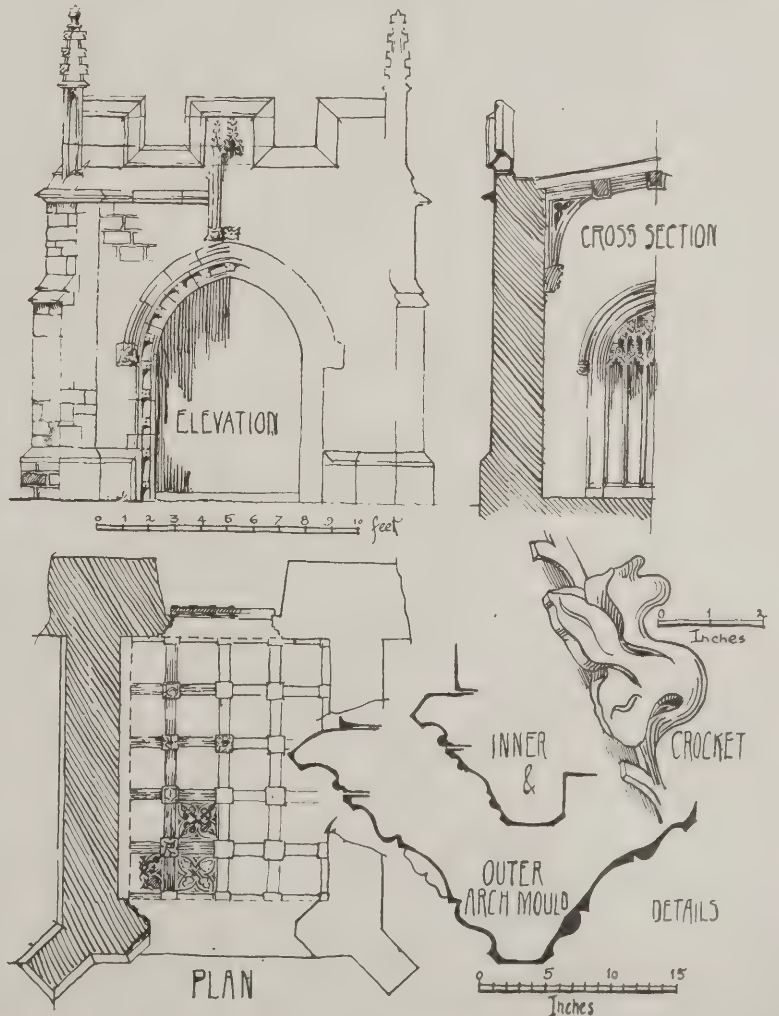
ORIEL.—Literally a place for prayer—*i.e.*, a domestic oratory, and often built with a projecting and overhanging window, hence the modern meaning of the term.

SQUINCH.—A small arch or arrangement of projecting corbels across an angle, used to carry the alternate sides of an octagonal spire or turret when the substructure was square.

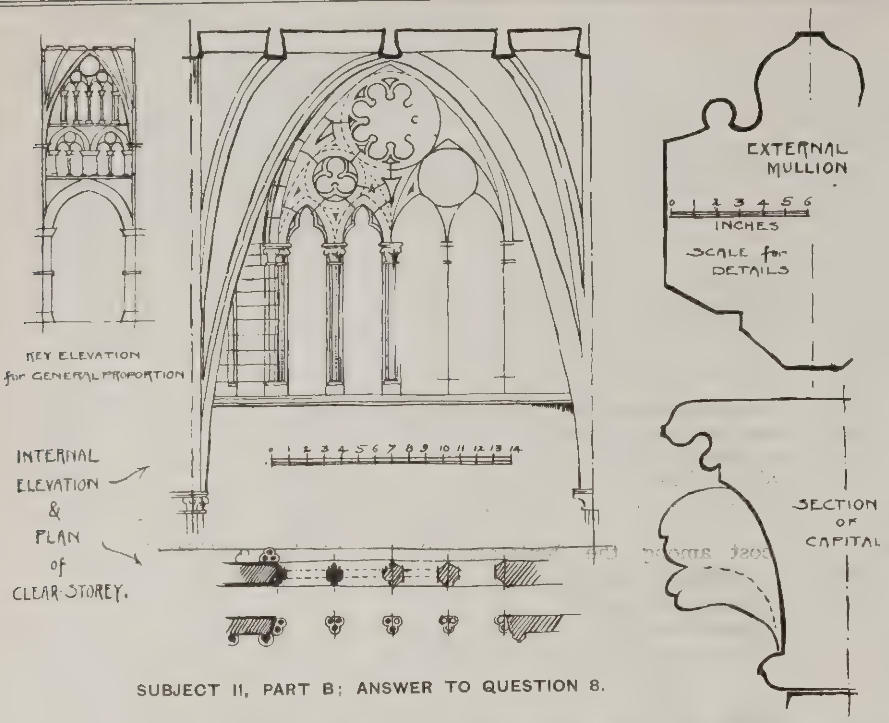
6. *Draw to 1-in. scale the elevation and section of a stone parapet: show the gutter and the start of the adjoining roof. Give some of the details full size.*

See illustrations.

7. *Draw to ½-in. scale a stone or wooden porch for a church or domestic building. Give plan, front and side elevations, cross-section, and draw some of the details half full-size.*



SUBJECT II, PART B; ANSWER TO QUESTION 7.



SUBJECT II, PART B; ANSWER TO QUESTION 8.

The illustration on the preceding page shows the stone porch of the church at Chittlehampton in Devon. The side elevation is omitted as being hardly necessary in this instance, seeing that there is no opening or other feature on either side externally. The cross-section and plan show the flat-pitch timber roof in general outline; a few details of the stonework are given to large scale. The work is of the Perpendicular period and probably somewhat late.

8. *Draw to ½-in. scale one bay of the clear-story of some cathedral or abbey. Give plan, elevation and section, show carefully and fully the jointing of the masonry, and give some details full size.*

See illustrations above.

A question of this sort seems at first sight to require a great deal more time than is usually available, but it must be remembered that it is not necessary (or even advisable) to give the general drawing in anything like detail. The question of proportion and general arrangement are far more important, and the examiner would realise that if the candidate could show these fairly accurately, with some typical jointing of masonry, and also give one or two enlarged details of the mouldings, he could also, with sufficient time, easily fill in and elaborate his drawing. The point to be aimed at, therefore, is to show as much knowledge of the subject as possible with as few lines as may be expedient. The subject here shown is from Lincoln Cathedral. A small key diagram of the whole bay elevation, as shown by the illustration, would be useful in arriving at the proper proportions.

[*Answers to the questions set in the Intermediate Examination were given in our issues for July 11th, July 25th and August 8th last.*]

An exhibition of engineering and machinery is to be held at Olympia from September 15th to October 17th inclusive. Among other features there will be a large electric fountain and air circulator. The air of the building will be drawn into the base by electric fans, and afterwards expelled, completely cleansed, cooled, and re-invigorated, at the rate of 10,000 to 12,000 cubic feet per minute.

Notes on Competitions

Cottage Homes, Cleadon, South Shields.

The conditions of this competition were criticised in this column a fortnight ago. Exception was taken to the clauses referring to remuneration, assessing, and time for sending in designs, and it was noted that efforts were being made to get these clauses, which were unsatisfactory, revised. The result has been in a measure gratifying, as may be judged from the following communication which has been sent to those whose names are upon the list of applicants for conditions: "In consequence of representations from intending competitors and others, requesting—1. An extension of time. 2. That an assessor be appointed, and 3. That the proposed remuneration be definitely specified; the Guardians have reconsidered these points and have decided—1. That an extension of time be granted from the 11th to the 28th September. 2. That the conditions of clause 2, reserving the right to call in a technical adviser, be adhered to, and 3. That the remuneration of the architect shall be on the usual terms, namely, £5 per centum upon the amount of the accepted tender, plus any further sums (if any) which may from time to time be authorised by the committee, and that the architect shall be responsible for the preparation and printing (or lithographing) of the bills of quantities for the builder, at a further remuneration of £1 5s. per centum upon the total cost of the works." These concessions are encouraging to reformers and to competitors, but they leave something to be desired. The intention of the promoters as to the method of assessing they propose to adopt is still indefinite, and will cause a considerable diminution of the number of competitors unless a prompt announcement is made that a competent assessor will be appointed. Information is being awaited upon this point. In the meanwhile time flies and the 28th September is near at hand. As regards 1¼ per cent. for quantities, this sum is probably adequate for buildings of the class to be dealt with, where repetition of identical items is frequent, but an allowance might have been made for lithography, and it should be definitely understood in advance whether an extra allowance will be made for measuring up variations at the completion of the works.

High School for Girls, Barnsley.

As it is intended that this column shall be, as far as is possible, a complete record of competitions from stage to stage, it may not be considered undesirable to mention that up to the time of going to press no reply has been received to the request made to the school governors that the remuneration of the selected architect should be at the usual rate. It will be remembered that the terms of this competition laid themselves open to the interpretation that the selection of competitors would be made from the lowest bidders, for applicants were to state the amount of commission they would be prepared to accept.

Premises for Leven Reform Co-operative Society, Ltd.

A frank confession of ignorance must be made as to the locality of Leven. Knowledge has been sought by reference to time tables, but without avail, and the post-mark is in obscurity together with the envelope that carried the conditions. One suspects the country north of the Tweed, and hazards a guess that within a radius of not many miles from Edinburgh information might be obtained. The conditions, written upon a memorandum sheet with evidence of carbon at the back, are as interesting as they are brief, and run as follows:—"Yours of——to hand anent particulars of new building. It is four large shops and commodious bakery on ground floor, with storage and offices, etc., above. Competitors to make out plans from site. Plans will be submitted to a competent assessor. Successful competitor will receive so much per cent. to see buildings erected. Plans to be in by end of September." Well, there is to be a competent assessor and what more could be desired. An interesting excursion to Leven might be organised to see the happy recipient of so much per cent. watching his buildings being erected.

Cemetery and Caretaker's House, Stewarton.

The information issued to architects for this competition is almost as brief as that for Leven, and is, if anything, less satisfactory. No plan of site is supplied, but the promoters make much of the nature of the soil, and send with their otherwise scant information the result of excavations to depths varying from one to nine feet. From this the intending competitor is able to learn that clay is the substance upon which his building will have to stand, but as to the nature of the building itself little is said, except that the caretaker's house is to consist of two rooms. There is no mention of an assessor. Premiums are to be awarded to plans placed second and third. What is to happen to the plan placed first is left to the competitor's imagination. The inference is, no doubt, that the author of it will be appointed to carry out the work, but inference is unreliable in matters of this kind.

Secondary School for Girls at Southport.

At a meeting of the Southport Education Committee held on August 30th it was reported that the offer made for the Grammar School premises in Scarisbrick Road, namely, £3,000, had been refused, the directors of the Proprietary School Co. asking £3,750. This was considered too much and the Sites Sub-Committee was instructed to get in competitive plans as soon as possible for a girls' secondary school on a site in Manchester Road.

Southend School.

The school which is to be erected on the Chalkwell Hall site at Southend-on-Sea, for which a competition is to be held among local architects, will be a mixed one, accommodating about 1,250 children in three departments. The total cost will be limited to £12 a head.

Carnegie Libraries, Dundee.

We have received a copy of the memorial addressed by members of the Dundee Institute of Architects, and other architects in Dundee, to the Lord Provost, Magistrates and Town Council, protesting against the designing of the new Carnegie libraries being put in the hands of the burgh engineer and city architect. The memorialists state they are not aware of any single instance in which a city official has been entrusted with the carrying-out of such work, and public opinion and municipal authorities in other cities have been entirely against such procedure. Without reflecting on the burgh engineer's merits as an architect, they point out that with so many official and administrative duties, together with the supervision of work of an intricate and practical nature, it is not possible for him to give the necessary amount of reflection and study which such buildings command, and if placed in his hands he must necessarily delegate the greater part of the work to irresponsible assistants. Even in the interests of true economy, the memorialists point out that if the work of designing and carrying out these libraries is done by the burgh engineer, the attendant expenses would be actually borne by the ratepayers of the city instead of by the donor. They appeal, therefore, for a competition, for which it is of first importance that a professional assessor should be nominated, who would draw up the necessary conditions in conjunction with the city officials, and would undertake the sole responsibility of selecting the best design.

List of Competitions Open.

CLEVELEYS COTTAGE EXHIBITION.

Judges' Award.

The following is the report and list of awards made by the judges in the cottage competition in connection with the exhibition now open at Cleveleys, near Fleetwood, on the Lancashire coast. The judges were Mr. John H. Woodhouse, F.R.I.B.A., president of the Manchester Society of Architects; Mr. Charles H. Barnsley, Birmingham, past-president of the Institute of Builders; and Mr. H. R. Aldridge, secretary of the National Housing Reform Council. They were appointed respectively by the Royal Institute of British Architects, the Institute of Builders, and the National Housing Reform Council.

Their report is as follows:—

The task of adjudicating in classes I. and II. of these competitions was rendered very difficult by the great differences in cost among the buildings erected. The conditions asked for "the best and most economical cottage," either single or in pairs, without any limitation as to cost, and the competitors have built cottages on some 30 different plans, which can be duplicated at a cost varying from £175 to £500 for each cottage. This variety adds to the interest of the exhibition, and we consider that most of the competitors are to be congratulated on their success in solving their differing problems on practical lines, and in many cases with pleasing architectural result; although we think that some of the buildings are too large to be considered as "economical cottages." Taking as our first consideration the ratio between cost and accommodation in each case, we selected, after careful study, a number of cottages which were fairly entitled to be called economical. Of these several were disqualified through faults of planning, while a few cottages, with very excellent and economical plans, were so lacking in architectural character that we excluded them from the list of awards. Other cottages possessing many valuable features were disqualified as a result of their incompleteness at the time of our award. Of the remaining cottages we very carefully compared the architectural character, economy and convenience of planning, soundness of construction, and cost of maintenance, and we award as follows:—

CLASS I.

First prize (£100).—Exhibit No. 27: architect, Albert E. Done, Blackpool; builder, various local builders.

Second prize (£50).—Exhibit No. 14: architect, Bertram Drummond, A.R.I.B.A., Blackpool; builders, J. Preston and Sons, Fleetwood.

Third prize (£25).—Exhibit No. 22: architect, Patrick Abercrombie, Chester; builder, E. Saville, Blackpool.

Honourable mention.—Exhibit No. 32: architects and builders, Lancaster & Atkinson, Fleetwood. Exhibit No. 24: architect, Gilbert Fraser, A.R.I.B.A., Liverpool; builders, Lancaster & Atkinson, Fleetwood. Exhibit No. 8: architects and builders, Dickinson & Kirkham, Bolton.

Highly commended (not for competition).—Exhibit No. 13: builder, J. P. Wilson, Fleetwood. Exhibit No. 31: architects, Tom G. Lumb & Co., Blackpool.

CLASS II.
